Dear Colleagues and Friends,

I am delighted to extend to you a warm welcome to the XIV World Congress of the World Psychiatric Association (WPA). Our organization is now flourishing with 135 National Psychiatric Societies and 65 Scientific Sections representing over 200,000 psychiatrists across the globe. We organize World, International and Regional Congresses of high appeal and broad geographic distribution. We publish World Psychiatry as our flagship journal along with several volume series and a number of sections' journals. We develop broad educational curricula and focused training programs. WPA Online is a richly informative and highly visited website. We are conducting several Institutional Programs including a growing one on Psychiatry for the Person, articulating science and humanism.

During the present triennium, WPA has made considerable advances in terms of governance, including the publication of our first set of Governance Plans and the 4th edition of the Manual of Procedures, implementation of the Permanent Secretariat, and the achievement of a fully balanced budget with a reserve of over USD 700,000. The growing promotion of our Member Societies has encompassed leadership meetings with a wide range of large and grouped societies (including presidential visits to the majority of them) and increasingly active Zonal Representatives. Prominent sectoral activities have taken place on Education (e.g., new programs on depression and personality disorders and a global array of CME credits), Publications (e.g. indexing of World Psychiatry, continuation and addition of several volume series, and expanding publication capabilities), Sections (e.g. funding of competitive Section projects, systematic survey of Sections performance, and specialized collaboration with member societies as exemplified by the Global Network of National Classification and Diagnostic Groups), and Scientific Meetings (high number and widely distributed WPA conferences and an evaluation program to enhance the quality of our congresses).

High success has been obtained with Institutional Programs approved by the Cairo General Assembly, i.e., Psychiatry for the Person, Disasters & Mental Health, Young Psychiatrists, Perinatal Psychiatry & Infant Mental Health, and Asia Mental Health, as well as with Task Forces on Brain Drain, Physicians Health, Mass Violence, and Specific Disasters. Recently established, in addition to the Jean Delay Prize, are the Philippe Pinel Prize on Psychiatry for the Person, Articulating Medicine’s Science and Humanism, and the Ulysses Vianna Prize for Young Psychiatrists in Developing Countries. Collaboration with international organizations has been a highlight of the triennium, particularly with the World Health Organization, World Federation for Mental Health, World Medical Association, World Organization of Family Doctors, World Federation of Neurology, World Federation for Medical Education, Council of International Organizations of Medical Sciences, International Council of Nurses, and International Alliance of Patients’ Organizations, many of them formally involved in a landmark Geneva Conference on Person-centered Medicine on May 29-30, 2008.

The XIV World Congress of Psychiatry that congregate us in fascinating Prague this September 20-25, 2008, reflects the achievements outlined above under the overall theme of Science and Humanism: For a Person-centered Psychiatry. It affirms a psychiatry that systematically cultivates our biological, psychological and social sciences placing them at the service of the person and his/her values and aspirations. We will enjoy in the Congress a scientific program constructed with a record number of submissions and which covers and articulates the various areas of our field with the participation of psychiatrists from across the world as well as unprecedented levels of health professionals, families and patients.

In fact, we have scheduled four Plenary Lectures given by the WPA President and President-Elect, the Jean Delay Prize recipient, and the Lord Major of Prague; and 50 Special Lectures presented by eminent scientists, health leaders, and the recipients of the Pinel and Vianna Prizes. We will have the opportunity to attend over 230 Symposia and 70 Workshops and Courses. Also attractive are eight Forums and six Video & Film Sessions. Additionally scheduled are substantial numbers of New Research Reports, Oral Communications and Posters. Among the highlights of the scientific program and closely connected to the Congress overall theme are a set of Special Symposia on Person-centered Psychiatry and Medicine and on International Classification and Diagnosis, a cross-Congress track (trialogs, symposia and lectures) on interactions among service users, families, and professionals, and a Special Track for Young Psychiatrists encompassing four Fellows Symposia, 16 Workshops led by world experts, and complementary encounters built on experience gained over several previous congresses.

In line with Prague’s impressive cultural resources, our Congress will offer dedicated performances of Mozart’s Don Giovanni (presented by the composer to Prague citizens as the only ones who understood him), special visits to the Pragues of Franz Kafka, Sigmund Freud, Charles the IV, Antonin Dvorak and Bedrich Smetana. Additionally, there are few more enjoyable pleasures in the world than getting lost on the walks and alleys of Prague’s old city.

Welcome again to this celebration of our field in interaction with colleagues and friends in a splendid city and to the opportunity to forge new relationships to advance our noble profession and our personal lives.

Professor Juan E. Mezzich, Professor Juan E. Mezzich, M.D., Ph.D.
President of the World Psychiatric Association
and of the XIV World Congress of Psychiatry

Juan Mezzich
Dear Colleagues, Partners and Friends,

I am delighted to welcome you to this World Congress of Psychiatry, which, for the wide range of the topics it covers and of the countries that are represented, provides a truly comprehensive picture of the current status of our discipline and our profession, a modern medical specialty which has a significant role in clinical medicine and public health. We are proud to be psychiatrists; we are aware that the treatments we use are among the most effective available today in medicine; and we are ready to defend and enhance the image of our profession. This World Congress of Psychiatry will represent an important opportunity in this respect.

Sincerely,

Professor Mario Maj, M.D., Ph.D.  
Chair of the Scientific Committee

Dear colleagues, dear partners, dear friends,

On the behalf of the Czech Psychiatric Association and its 1,100 members as well as on the behalf of the Organizing Committee, it gives me great pleasure to invite you to join us at the XIV. World Congress of Psychiatry in Prague, the capital of the Czech Republic.

Since the Middle Ages, “Golden Prague” has enjoyed the reputation of being one of the most beautiful cities in Europe. It flourished and expanded during the epoch of Charles IV, the most celebrated of all Czech Kings and Emperor of Rome. During his tenure, Prague became the Emperor’s residential city and one of the political hubs of Europe. In 1348, he founded Charles University, the oldest university in central and eastern Europe. Many nations and cultures, especially Czechs, Jews and Germans, co-existed peacefully in the magnificent city that developed over the centuries along the Vltava River. Jan Hus (1371-1415), Rector of Charles University and renowned theologian, preached here about the necessity of church reform. Wolfgang Amadeus Mozart (1756-1791) composed his opera Don Giovanni for “…the Prague people who understand me”. Franz Kafka (1883-1924) wrote his famous works The Trial and The Castle here.

It is often said that modern Czech psychiatry has developed under the influence of German psychiatry. One of the oldest German psychiatric departments was set up in Prague at Charles University in 1886. Arnold Pick (1851–1924) served as the first head of this Department for an incredibly long 35 years. It was here in Prague that he described front temporal dementia (Pick’s disease) in 1892. What is not common knowledge though is that Sigmund Freud was born in one of the regions of what is today the Czech Republic (Pribor, in 1856), or that Czech psychiatrist Jan Jansky, while studying blood samples of patients with psychoses, discovered the fourth blood group in 1907.

Nowadays, you can admire not only the historical monuments of Prague, but also enjoy the great variety of cultural and social events taking place in the city every day, including the opera Don Giovanni at the Theatre of the Estates, the very place where it was first performed on October 29, 1787 under the baton of Wolfgang Amadeus himself.

Czech psychiatry, too, has experienced remarkable development in recent years and Czech psychiatrists are ready and privileged to be able to welcome you in Prague and to extend their warmest hospitality.

I believe you will enjoy your stay in Prague.

Professor Jiří Raboch, M.D.  
President of the Organizing Committee  
President of the Czech Psychiatric Association

SCIENCE AND HUMANISM: TOWARDS A PERSON-CENTERED PSYCHIATRY

INSTITUTIONS
1. International Center for Mental Health, Mount Sinai School of Medicine, New York, United States

AUTHORS
1. Juan E. Mezzich

A reflection on the fundamentals of psychiatry in particular and medicine in general identifies two critical factors. One is science as a crucial method to enhance the effectiveness of our professional efforts. It encompasses a biopsychosocial framework to appraise and deal adequately with the complexity of our field. The other is humanism, which speaks of the essence of our vocation as members of a helping profession committed with high ethical aspirations to promote the person’s dignity and assist in reaching health and life fulfillment.

It is proposed that the engagement of science and humanism can be optimized by placing the person in context at the center of our professional efforts. This would involve promoting a psychiatry of the person (of the totality of his/her health, illness and positive aspects included), for the person (striving to assist in the fulfillment of the person’s life project), by the person (with clinicians extending themselves as full human beings with high ethical aspirations), and with the person (in respectful collaboration with the person who presents for care).

The current WPA initiative on psychiatry for the person has made substantial progress in delineating its conceptual bases, in designing a person-centered integrative diagnostic model that complements the classification of disorders, in preparing guidelines for person-centered clinical care and pertinent training curricula, and in outlining efforts to enhance public health through the promotion of the person in context. These efforts are reaching a new dimension through steps to collaborate with global medical and health organizations towards the development of person-centered medicine and health care.
A conflict of interests occurs when a physician is unduly influenced by a secondary interest (i.e., a personal incentive) in his acts concerning one of the primary interests to which he is professionally committed (the welfare of patients, the progress of science, or the education of students or residents). One specific variety of conflicts of interests has almost completely monopolized the attention of scientific and lay press: the financial conflicts of interests arising from the relationships between physicians and drug companies. Some empirical evidence is now available in this area. On the other hand, it has been pointed out that the current debate on this issue is sometimes "affectively charged", or fails to take into account that the interests of patients, families and mental health professionals and those of the industry may be often regarded as convergent. Other types of conflicts of interests are beginning now to be discussed. There is an emerging evidence about how the allegiance of a researcher to a given school of thought may influence the results of studies comparing different psychotherapeutic techniques, thus colliding with the primary interest represented by the progress of science. There is also a small body of literature concerning political commitment as a source of conflict of interests. Financial and non-financial conflicts of interests are widespread in psychiatric practice and research. They cannot be eradicated, but must be managed more effectively than is currently the case.

The lecture will highlight and discuss some of the important issues and controversies of current depression treatment like the efficacy of antidepressants, their effect on suicidality, their place in a complex psychiatric treatment strategy including psychotherapy and other psychosocial activities. The efficacy of antidepressants is clinically significant, but often monotherapy with one drug has to be followed by others or by comedication/augmentation therapy approaches. Psychosocial therapy, predominantly focused on psychotherapeutic strategies, can also contribute in a relevant way to the therapeutic success. Generally antidepressants reduce suicidality, but under special conditions like young age or personality disorder, they can also be harmful in this respect. However, under the conditions of good clinical practice, the risk-benefit relationship of treatment with antidepressants can be judged as favourable. In addition, the paper tries to analyse the question about how to reach individualised, evidence and value oriented decision making in the complex treatment of depressive patients. The capacity of psychiatrists to individualise treatment decisions in terms of 'the right drug/treatment for the right patient' is still restricted since there are currently not enough powerful clinical or biological predictors, which help to achieve this goal. There is hope that in future pharmacogenetic will contribute significantly to a personalised treatment. The ideal that all steps of classical decision making can be based on the strict rule of evidence based medicine is far away from reality. Individualised decision making is so complex that the rigorous expectations of evidence based medicine can hardly be fulfilled. Finally, it should be considered that clinical decision making is not only evidence but also value oriented.

COLLABORATION BETWEEN NEUROLOGISTS AND PSYCHIATRISTS: HOW CAN THEY COMMUNICATE BETTER WITH EACH OTHER?

INSTITUTIONS
1. Haukeland University Hospital, Neurology, Bergen, Norway
2. World Federation of Neurology, United Kingdom

AUTHORS
1. Johan A. Aarli1,2, Dr., PhD, johan.aarli@nevro.uib.no

Although neurology and psychiatry are different specialties, interface problems, such as Parkinson’s disease (PD), epilepsy and nonepileptic seizures, represent challenges to both. Many physicians may regard PD as a pure motor disorder. However, more than 80% of the patients have at least one non-motor symptom. Dementia, depression and psychosis are not uncommon among patients with PD. The neurological and psychiatric symptoms are interwoven and should not be regarded as two different diseases. It has therefore been claimed that such patients should be screened for depression and/or dementia associated with the brain disorder. Psychiatrists are usually not involved in the choice of pharmacological treatment for depression in these patients. Most patients with epilepsy do not have any psychiatric stigmata, and behavioural disorders in epilepsy, when they occur, have multiple risk factors and multifactorial aetiology. Psychogenic nonepileptic seizures are seen in 20-30% of patients referred for refractory seizures. Comprehensive care of epileptic patients requires attention to the psychological and social consequences of epilepsy as well as to the control of the seizures. Quite often, this is by a nurse, a teacher, social worker, but it is a common experience that neurologists and psychiatrists do not always collaborate as needed. Neurology and psychiatry have a common origin, but will never merge. They are big, comprehensive and are still in lack of manpower. But, at least in neurology, subspecialties are developing with a need for comprehensive teamwork. New training programs are needed, where psychiatrists and neurologists receive the same basic training.

TOWARDS MORE HUMANISTIC PSYCHIATRY: DEVELOPMENT OF NEED-ADAPTED TREATMENT OF SCHIZOPHRENIA GROUP PSYCHOSES

INSTITUTIONS
1. University of Turku, Finland

AUTHORS
1. Yrjö O. Alanen

The group of schizophrenic psychoses is clinically and prognostically very heterogeneous - we may ask whether it is justifiable at all to speak about an illness called “Schizophrenia”. The contradictory and antagonistic views with regard to etiological questions have had a major negative effect on the development of treatment, especially psychotherapeutic methods. There is an obvious need for more integrated approaches.

According to the author the causes of these psychoses are multifactorial, both multi-faceted and multi-layered, differently weighted in different cases. We should study the development and precipitating factors of every person’s psychosis individually and plan his/her treatment on this knowledge.

This has been done in the need-adapted treatment of schizophrenia group psychoses, developed gradually by the author and his co-workers in Finland beginning already during the 1970s. Our aim was a comprehensive and psychotherapeutically oriented treatment approach for schizophrenia group psychoses possible to be applied more generally in public psychiatric health care. Hospital wards were developed into psychotherapeutic communities, both individual and family therapeutic relationships as well as group activities were developed in a multi-professional context, so as to best meet the real, changing needs of individual patients as well as the people making up their interactional environment. Pharmacotherapy was regarded as a mode of treatment supporting psychosocial therapies. A crucial step forward was the initiation of treatment with so-called therapy meetings, jointly participated by the treating team, the patient, and his/her family members (or sometimes other persons close to him).

During the last years, several projects applying the need-adapted model has been developed in Finland and other Scandinavian countries and this approach has met increasing interest also elsewhere in Europe. The author describes experiences and results of some projects and is also shortly dealing with impeding factors.

The author regards both the Psychiatry for the Person initiative and the establishment of the Pinel Prize as indications of a new development which will make psychiatry more humanistic and at the same time facilitate the integration of different approaches.
THE RISK AND THE BURDEN OF BIPOLAR DISORDER

Bipolar disorder (BD) presents with a multitude of symptoms that include not only mood dysregulation, but also affect other psychiatric and physical domains. Especially cognitive and possibly structural brain changes are among factors relevant for outcome of the illness. Whether these changes represent vulnerability to BD or whether they develop and advance purely as a consequence of the illness episodes has not been firmly established. Yet, this distinction is important for both clinical (prevention, minimization of their impact) and theoretical (better understanding of the inherent risk and pathophysiology) reasons. We have attempted to separate these in a series of investigations of adolescents and young adults at high risk of developing bipolar disorder due to their family histories. The findings indicate that neurocognitive functioning and structural brain findings are more or less intact in those who are yet unaffected or have just become ill. On the other hand, in patients with a history of repeated episodes we could detect changes indicative of an impairment. This is congruent with our findings of an increased risk of neurodegenerative conditions including Alzheimer's disease in BD subjects. The progressive brain changes in BD may be linked to the vulnerability to the illness as genetic studies highlight the possible role of BDNF, GSK-3beta and CREB in susceptibility to BD. Taken together these results paint a picture of genetically based risk of progressive brain changes that could be attenuated by suitable neuroprotective treatments.

RECOVERY - RESHAPING OUR CLINICAL AND SCIENTIFIC RESPONSIBILITIES

Context - Advocacy for Recovery has been joined by research offering new perspectives on mental health policy, treatment, rehabilitation and anti-discrimination efforts.

Objectives - Chances and challenges of a Recovery model for the mental health field will be presented and discussed.

Key messages - Recovery is currently widely endorsed as a guiding principle of mental health policy. New rules for services, e.g. user involvement and person-centred care, as well as new tools for clinical collaborations, e.g. shared decision making and psychiatric advance directives, are being complemented by new proposals regarding more ethically consistent anti-discrimination and involuntary treatment legislation as well as participatory approaches to evidence-based medicine and policy.

Conclusions - Consequences and challenges of the Recovery model need to be tackled from different perspectives by clinicians, researchers, policy makers and - essentially - users and carers and their representatives in order to be fully explored and brought to life.

Farkas M (2007) The vision of recovery today: what it is and what it means for services. World Psychiatry 6: 4-10
SL-05
ETHICS AND PSYCHIATRY FOR THE PERSON: TWO CONVERGENT CONCEPTS

INSTITUTIONS
1. Hellenic Centre for Mental Health and Research, Athens, Greece

AUTHORS
1. George Christodoulou

In practically all existing Ethics codes from the time of the Hippocratic Oath to contemporary times, care for the patient represents the most important priority in the list of deontological obligations of the physician. In practice, however, a number of issues, like the "double agent" role of the physician, termination of life-sustaining treatment on the patient’s request etc. remain controversial. This is particularly true in the case of Psychiatry, in the area of which important ethical issues like its potential abuse have at times tormented the psychiatric community.

Psychiatry for the Person represents an attempt to bring our discipline (and potentially all Medicine) back to its roots. Hyperbolic dependence on technology, shift of attention to “productivity”, restrictions of time to communicate with the patient and wrong priorities have downgraded holistic care for the patient and the doctor-patient relationship. Yet, care for the patient represents the most important ethical obligation of the physician. In this sense, Psychiatry for the Person and Ethical virtues and obligations converge to serve the same purpose, namely the suffering person.

The theoretical foundations of psychiatric ethics (Virtue ethics, Casuistry, Deontology, Utilitarianism, Principilism and Ethics of Care) will be discussed under their relevance to Person-centered Psychiatry.

THE SCIENCE OF WELL-BEING

INSTITUTIONS
1. Washington University, Psychiatry, St. Louis, United States

AUTHORS
1. C. Robert Cloninger, Dr., MD, crcloninger44@gmail.com

In Feeling Good: The Science of Well-Being (Oxford 2004) Cloninger has presented a holistic approach to understanding health and disease. Rather than relying on categorical diagnoses, every patient can be assessed systematically in terms of a moderate number of variables, each with a distinct psychology, biology, and sociology.

Key variables include three dimensions of character (Self-directedness, Cooperativeness, and Self-transcendence) and four dimensions of temperament (Harm Avoidance, Novelty Seeking, Reward Dependence, and Persistence). Each of these are measured by Cloninger’s Temperament and Character Inventory (TCI) and has distinct psychobiology based on genetics, brain imaging, and psychology. These TCI variables also indicate a person’s maturity of self-government. Well-being only arises when a person learns how to let go of struggles, to work in the service of others, and to grow in self-awareness.

As a result, it is important to consider the narrative of a person’s life in helping people to develop well-being. This requires reflection on one’s outlook on life, which can be viewed as a process of broadening and expanding the use of all of a person’s intelligences. Human intelligences include learning of habits and skills, learning of facts and propositions, and also a creative intelligence that is intuitive and free. Therapy can be individualized for people based on their profile of meta-cognitive dysfunction in self-aware consciousness from which their model of the self (character) and emotionality (temperament) arises as an adaptive strategy. A psychoeducational program for well-being has been developed, called Voyages to Well-Being (see https://psychobiology.wustl.edu).

NEW STRATEGIES TO ADVANCE MENTAL HEALTH ACROSS THE WORLD: DO WE NEED MORE PSYCHIATRISTS OR BETTER TECHNOLOGY?

INSTITUTIONS
1. World Federation for Mental Health, President, Washington DC, United States
2. University of Liverpool, Department of Psychiatry, Liverpool, United Kingdom

AUTHORS
1. John R M Copeland1,2, Professor, MD, ScD, jrmcop@btinternet.com

World mental health reports have had little political impact. Now the Lancet’s Global Movement has updated economic and other arguments and made a powerful case. Some low income countries have made important strides, so low income is not itself a barrier to better services. Major donors have ignored mental health. Ignorance, stigma and lack of will are major barriers.

WFMH has traditionally identified problems and tried to tackle them. World Mental Health Day is widely celebrated and its Biennial Congress draws over a thousand delegates. It has promoted prevention, tackled the World Bank, persuaded the ILO and the WHO to work together and continues to press the cause at the United Nations.

There remain obstacles. Mental health workers are expensive and often emigrate. Primary care is overburdened; millions go untreated; abuses against consumers continue. The Lancet Series provides a firm basis for advocacy; so what strategies do we need?

For advocacy we must build a global consensus. A united voice is essential at the UN and with governments. Consumers should find areas of mutual agreement and join. Governments everywhere must be made accountable for human rights violations. Grassroots mental health associations in wealthy countries must help to nurture those in low income countries. Mental health workers can be skilled with computerised clinical diagnostic and care assessments to close the treatment gap. The aim is parity with physical health, nothing less, not hopeless, not unaffordable but a right.

PHILOSOPHY AND PSYCHIATRY

INSTITUTIONS
1. Brazilian Brain Institute, Rio de Janeiro, Brazil

AUTHORS
1. Jorge Alberto Costa e Silva1, Dr., MD, jacs@vetor.com.br

Mental Health practitioners - claim a special expertise in the mental. The philosophy of mind should be their philosophy. Conversely, mental health practice should be uniquely interesting to philosophers of mind. Yet for much of the twentieth century, the two sides, philosophers and practitioners, have studiously avoided each other. Historically, philosophy and general psychology were not sharply distinct. However, abnormal psychology, madness, has nearly always been very much at the fringes of philosophical interest. Historically, then, the overall pattern of the relationship between philosophy and abnormal psychology, has been inconstant. At the start of the twenty-first century, philosophy, psychiatry and abnormal psychology, are coming together again. But, it is above all in the philosophy of mind that there are deep points of contact between philosophical theory and mental health practice and research. From the central metaphysical, deeps of the mind-body problem, through the diversity of philosophy, psychopathology, to the underpinnings of key topics in the philosophy of science, ethics, and conceptual analysis, the philosophy of mind is crucially important for mental health practice and research. But, in all these areas, too, mental health practice and research are also crucially important to philosophy.

PERINATAL MENTAL HEALTH AND THE MILLENNIUM DEVELOPMENT GOALS: A GLOBAL PRIORITY.

INSTITUTIONS
1. World Psychiatric Association, Geneva, Switzerland

AUTHORS
1. John L. Cox, Professor, Prof, john1.cox@virgin.net

Climate Change, Mass Violence and Poverty affect disproportionately women and children. Maternal and infant mortality is increased, and the pre-school child disadvantaged by insecure attachment and cognitive deficits.

The evidence for the seriousness of these threats to the survival of families is summarised with reference to the World Health Report (WHO 2005), the Lancet (2007) series on Poverty and Child development, and the WPA Institutional Programme on Parent and Infant Mental Health.

Results of primary care research in Chile, Vietnam, South Africa, Australia and Scandinavia suggest that these effects can be ameliorated by culture specific community interventions.

The lecture concludes with Global and personal action points that could be considered to reduce the effect of poverty and climate change on perinatal health, and how the Millennium Development Goals could yet be achieved.

NEUROSCIENCE AND VALUES: PHILOSOPHY INTO PRACTICE IN 21ST CENTURY MENTAL HEALTH AND SOCIAL CARE

INSTITUTIONS
1. Oxford University, St Cross College, Oxford, United Kingdom
2. University of Warwick, Warwick Medical School, West Midlands, United Kingdom
3. UK Government, Department of Health, London, United Kingdom

AUTHORS
1. KWM (Bill) Fulford1,2,3, Professor, DPhil FRCP FRCPsych, k.w.m.fulford@warwick.ac.uk

This lecture will outline advances in the new philosophy of psychiatry focusing particularly on their practical impact in the UK and internationally. Key academic developments in the field have included: the setting up of many new groups around the world, including sections in the WPA and AEP; and of an International Network for Philosophy and Psychiatry; the continued expansion of the quarterly peer-reviewed journal, Philosophy, Psychiatry, & Psychology; and of several book series; the establishment of a number of new Chairs for the field; and a recently announced DPhil scholarship in the Philosophy Faculty at Oxford. More important still, however, is the way in which these academic developments have been successfully translated through policy, training and service development, into a number of exciting initiatives in service user centred practice in mental health and social care in the UK and internationally. These initiatives, as will be described further in the lecture, have been developed in close partnership with the WPA through the Institutional Programme on Psychiatry for the Person. In a brief concluding section, it will be shown how, set in its historical context, the new philosophy of psychiatry, in being research-led, practical in focus, and international in scope, is at the forefront of developing a new model of mental health and social care for the 21st century, that is both firmly science-based and also fully responsive to the very diverse needs of those who use services, whether as patients or carers, in our increasingly multicultural society.

ADVANCES IN UNDERSTANDING AND TREATMENT OF CONDUCT DISORDER IN CHILDHOOD AND ADOLESCENCE

INSTITUTIONS
1. Institute of Child Health, London, United Kingdom

AUTHORS
1. Philip Graham

There are three good reasons for focusing on conduct disorder at this meeting. First, there is evidence of a large increase in western countries in prevalence. Second, apart from developmental disorders such as autism, conduct disorder is the diagnosis with the greatest continuity from childhood to adulthood. Third, there have been significant recent advances both in our understanding and treatment of this condition. In particular, whereas even ten years ago it would have been hard to point to any psychological interventions whose effectiveness was soundly based on scientific evidence, this is now far from the case.

Follow-up studies have made clear that there are two characteristic life patterns that can be identified in conduct disorder. One is life-course persistent, beginning in early childhood but persisting into adolescence and adulthood. In this type social disadvantage often interacts with neuro-developmental deficits. Then there is adolescence-limited conduct disorder, which has neither the same neuro-developmental associations, nor the poor prognosis. Psychological studies in their turn have enabled us to distinguish two sub-types of aggression, one largely reactive to perceived threat and the other more predatory and controlled.

Finally recent studies evaluating effectiveness of interventions point to the particular value of parent training in early and mid-childhood. In adolescence family-based and multi-level interventions have been shown to improve prognosis.

COMMUNITY CARE FOR PEOPLE WITH PSYCHOSIS: INCLUSION AS A VALUED OUTCOME AND A HUMAN RIGHT

INSTITUTIONS
1. University of Melbourne, Psychiatry, Melbourne, Australia

AUTHORS
1. Helen Herrman, Prof., h.herrman@unimelb.edu.au
2. Carol Harvey, Prof, c.harvey@unimelb.edu.au
3. Prem Chopra, Dr, Prem.CHOPRA@svhm.org.au

Advances in understanding recovery and effective community-based and balanced care leave a dilemma. A significant subgroup of people treated for psychosis in affluent countries remain severely disabled, take little part in community life and are socially isolated, as illustrated by recent work in Australia and UK\(^1\). Most of those with psychosis in poorly resourced countries receive no formal care despite successful demonstration of community rehabilitation approaches. What can be done to make better use of community resources and the hospital and other components of balanced care, and to avoid reinstitutionalisation in any form?

Clinical services can support recovery for people with psychotic disorders, including complex problems, and assist families. This is the exception, however. The social environment also has a strong influence on the symptoms and functioning of a person with schizophrenia. Interventions in supported housing, welfare, and vocational and social support, are the responsibility of sectors outside health, creating barriers to holistic recovery-oriented care. Stigma, unwarranted pessimism about outcomes, and inadequate resources further impede program development and evaluation.

The inadequate implementation of psychosocial interventions in clinical services, and disability inclusion approaches to greater community participation require action; and follow-up studies to assess a range of outcomes over several years in local settings. Subjective measures of functioning and quality of life are now recognized as important, distinct and measurable outcomes for individuals recovering from psychosis, and future work will benefit from this perspective.

SL-14

THE HISTORICAL PERSPECTIVE: A NECESSARY SCIENTIFIC TOOL FOR 21ST CENTURY PSYCHIATRY

INSTITUTIONS
1. University of Zurich, Dept. of Social and General Psychiatry, Zurich, Switzerland

AUTHORS
1. Paul Hoff, Prof., MD PhD, paul.hoff@puk.zh.ch

History of science in general and history of psychiatry in particular are often regarded as interesting fields, which, however, are not of practical relevance for the actual situation of research or, in the case of medicine, of diagnosis and therapy. This may be one reason for the fact that many stimulating debates on the history of psychiatric ideas are generated outside psychiatry, i.e. in the history, philosophy or sociology departments. This paper will characterize major psychiatric, especially nosological theories from the 19th and early 20th centuries in order to demonstrate the stunning parallels in the fundamental questions that steered the historical theories as well as they strongly influence the present day debate on the identity of psychiatry. These questions include, for example, the notions of "nature", "person", and "subjectivity." This complex and relevant matter cannot be understood without a thorough knowledge of the history of ideas.

PHENOTYPE-GENOTYPE RELATIONSHIP IN PSYCHIATRIC DISORDERS: THE CASE OF SCHIZOPHRENIA

INSTITUTIONS
1. The University of Western Australia, School of Psychiatry and Clinical Neurosciences, Perth, Australia

AUTHORS
1. Assen Jablensky, Prof., MD

Phenotypic variability and extensive genetic heterogeneity have been confounding the search for the causes of schizophrenia since the inception of the diagnostic category. The inconsistent results of genetic linkage and association studies using the diagnostic category as the sole schizophrenia phenotype suggest that the current broad concept of schizophrenia does not demarcate a homogeneous disease entity. Approaches involving subtyping and stratification by covariates to reduce heterogeneity have been successful in the genetic study of other complex disorders, but rarely applied in schizophrenia research. This Special Lecture will provide a critical overview of past and present attempts at delineating schizophrenia subtypes using clinical features, statistically derived measures, and putative genetic indicators, and highlighting the potential utility of intermediate (endo-) phenotypes based on measures of cognition.
SL-17
INTEGRATION OF MENTAL HEALTH INTO PRIMARY HEALTH CARE

INSTITUTIONS
1. Institute of Psychiatry, Health Services and Population Research Department, London, United Kingdom

AUTHORS
1. Rachel Jenkins, Professor, MD FRCPsych FFoHM DI, r.jenkins@iop.kcl.ac.uk

While mental health is an intersectoral issue, with interventions required in the education, social welfare, criminal justice and NGO sectors, nonetheless significant inputs are needed from the health sector to address mental health needs. However, in low- and middle-income countries, the specialist health infrastructure to address these needs is highly limited, and in many places numbers are falling rapidly with retirement, mortality and emigration. Recruitment is not keeping pace, partly due to the introduction of course fees for specialist medical and nurse training. Thus the specialist service can only deal with a very tiny proportion of all those in need.

Most people with mental disorders will need to be seen and treated in primary care, but the general primary care health infrastructure has been weakened by HIV/AIDS, conflict, lack of continuing professional development, lack of support and supervision from the district level, lack of transport and lack of access to medicines. Regular health sector reform strategies rarely include integration of mental health concerns, despite the known linkages between mental and physical disorders. In addition to a shortage of human resources and infrastructure, there is very poor access to a sustained supply of psychotropic medicines which, if effectively used, could substantially reduce the disease burden from mental illness.

This talk will address the rationale for action, challenges, entry points and solutions to integration of mental health into primary health care in low and middle income countries.

SL-18
IS REALLY DEPRESSION SO FREQUENT? THE CONCEPT OF DEPRESSION

INSTITUTIONS
1. Federal University of Sao Paulo/UNIFESP, Psychiatry, Sao Paulo, Brazil

AUTHORS
1. Miguel R Jorge, Prof., MD, PhD, migueljorge@terra.com.br

Objectives: To put in an historical perspective different concepts of depression and their implication in current epidemiological surveys and clinical practice.

Methods: Literature review.

Results: Since Hippocrates recorded for the first time in the western world a case compatible with the current notion of melancholia and Aristotle link this word with diseases caused by black bile, the concept of depression in under regular scrutiny and constant revision. In the last decades, different ways of naming depressive disorders (unipolar/bipolar, endogenous/reactive, major/minor, somatic, masked) and differentiating them from sadness, pathological grief, and natural unhappiness in diverse cultural contexts have been represented in their identification (diagnostic criteria) and classification (including subtypes and specifiers). An overrepresentation in community studies and an overdiagnosis and treatment of depressive states in clinical settings could be attributed to a low threshold for their recognition and also to the medicalization of normal feelings.

EMERGING OPPORTUNITIES IN PSYCHOPHARMACOLOGY

INSTITUTIONS
1. Medical University of Vienna, Department of Psychiatry and Psychotherapy, Vienna, Austria

AUTHORS
1. Siegfried Kasper¹, Prof., MD, sci-biopsy@meduniwien.ac.at

Based on both clinical experience and the emerging knowledge on biological mechanisms in mental disorders, a number of promising refinements have been introduced into psychopharmacology in the recent years. With the lead of the selective serotonin reuptake inhibitors (SSRIs), dual acting antidepressants like the serotonin-norepinephrine reuptake inhibitors (SNRIs) as well as receptor specific antidepressants have been developed. Biological research indicated that there is a lower activity of the monoamine function in depressed patients as well as a dysfunction in anxiety disorders. The introduction of second-generation antipsychotics (SGAs), with the lead compound clozapine at the beginning of the seventies, took quite a while until further compounds followed. This development paralleled the understanding of not only the dopaminergic system but also the serotonergic mechanisms of action in schizophrenia as well as bipolar disorders. Future approaches in psychopharmacology will include predictors not only on a phenomenological level but also on a functional and genetic level. Pharmacogenetic approaches, which take the polymorphisms of the different pharmacodynamic properties and the P450 system into account, will lead to a more patient-tailored approach as opposed to having a medication available for whole diagnostic criteria.

CULTURAL PSYCHIATRY IN A GLOBALIZING WORLD

INSTITUTIONS
1. McGill University, Division of Social & Transcultural Psychiatry, Montreal, Canada
2. Jewish General Hospital, Institute of Community & Family Psychiatry, Montreal, Canada

AUTHORS
1. Laurence J. Kirmayer¹,², Professor, MD, laurence.kirmayer@mcgill.ca

In recent years, cultural psychiatry has undergone a transformation, shifting its focus from exoticized ‘others’ to the core issues of psychiatric theory and practice. This presentation will consider four broad questions central to the future of culture psychiatry: What does culture mean at the level of the individual, family, community, society, international arena, and the planetary system? Is cultural diversity disappearing in the face of globalization? How can psychiatry best respond to cultural diversity in the context of different societies and health care systems? Evidence will be presented to suggest that: (i) Cultures are extended systems of shared knowledge and social practice; their boundaries and distinctiveness depend in part on processes of conflict and contestation; (ii) Globalization is fostering a multiplicity of cultural influences on each individual and community, creating new hybrid cultural forms and, in some places, accentuating differences between groups. (iii) Culture involves ongoing processes of the discursive and interactional construction of brain, self, and society that influence illness experience, coping and healing. (iv) A variety of models of mental health service and modes of psychiatric practice can respond to the diversity found in most geographic regions and urban settings. Cultural consultation, in particular, is a model of service that can be adapted to many different health systems and settings. Beyond improving the effectiveness of health services, cultural psychiatry can contribute to building pluralistic societies.

TRENDS AND PERSPECTIVES IN INTERNATIONAL MEDICINE

INSTITUTIONS
1. World Medical Association, Ferney-Voltaire, France

AUTHORS
1. Otmar Kloiber

Thirty years after the Alma Ata Declaration of the World Health Organization calling for “health for all in the year 2000” the problems remain the same or even worse: The poorest on this planet still have nearly no access to health care and are threatened even more than 30 years ago by HIV/AIDS, Tuberculosis, Malaria and many other diseases. Like in the 70s of last century the crisis is aggravated by a severe brain drain from poorer countries.

The approach to tackle the problem is called “Task Shifting”: charging lay persons with functions and duties of health professionals.

While the lack of health professionals, especially physicians, leaves no choice other than to charge other groups with medical and nursing functions, the way how that will be done is critical for the future of those health care systems. Not only that improperly delegated tasks especially in the treatment of infectious diseases can significantly increase the occurrence of resistant microorganisms, the further abolishment of work opportunities for the remaining health professionals may drive those out of their countries leaving all patients not being in the few vertical disease programs without any treatment.

If task shifting should not only be a measure for short term successes, but for sustainable care, it will have to be accompanied by activities to train new health personal and especially to retain the present health professional workforce.

30 years after Alma Ata people deserve more than just promises.

SL-23
HARASSMENT AND DISCRIMINATION FACED BY (EX-) USERS AND SURVIVORS OF PSYCHIATRY IN THE PSYCHIATRIC FIELD

INSTITUTIONS
1. ENUSP, European Network of (ex-) Users and Survivors of Psychiatry, Berlin, Germany

AUTHORS
1. Peter Lehmann, info@enusp.org

Context: It is well-known from many studies that (ex-) users and survivors of psychiatry are discriminated against in many fundamental ways. Studies show violations of human rights, human dignity, self-determination and physical inviolability; individuals with psychiatric diagnoses are detained without freedom of choice, and the demand for non-medical alternatives beyond psychiatry is not satisfied. Objectives: This lecture will raise awareness about numerous proposals from the WHO, the European Commission, organisations of professionals, relatives, (ex-) users and survivors of psychiatry; NGOs including the WPA, and provide proposals to combat harassment and discrimination.

Key Message: A broad range of measures are available that would improve the situation of (ex-) users and survivors of psychiatry, lower the despair of supporting relatives and prevent the burn-out of well-intentioned psychosocial professionals. A key feature of all measures that provide hope for change of this situation is the inclusion of organisations of independent (ex-) users and survivors of psychiatry like ENUSP on all levels of decision making, especially those (ex-) users and survivors of psychiatry who overcame problems like so-called schizophrenia and psychosis and have shown that recovery is possible - without and with psychosocial treatments, but sometimes also in opposition to psychiatric treatments.

Conclusion: Stopping the exclusion of (ex-) users and survivors of psychiatry would be a good starting point in a discussion about how the psychosocial field could start to deliver appropriate help, respectful of human rights, to overcome unresolved emotional problems of a social nature.

BUILDING TOWERS OF STRENGTH

INSTITUTIONS
1. University of Hong Kong, Departments of Psychiatry, Hong Kong, Hong Kong Special Administrative Region of China

AUTHORS
1. Felice Lieh-Mak¹, flmak@hkucc.hku.hk

Doctors are regarded as towers of strength by patients and their families. This talk will focus on the challenges faced by doctors in their practice and how to prepare medical students to face these challenges. This is an area that is often neglected in the medical curriculum despite the fact that it is an important aspect of a doctor’s life. Some medical schools have incorporated various elements of cultivating psychological well-being in medical students and others include seminars in stress management. This is an attempt to review these curricula and to look at what works.

THE NATURAL HISTORY OF ANXIETY DISORDERS

INSTITUTIONS
1. Complutense University of Madrid, Instituto de Psiquiatría y Salud Mental, Madrid, Spain

AUTHORS
1. Juan J. López-Ibor¹, Prof., MD, PhD, jli@lopez-ibor.com

There is insufficient knowledge of the long-term course of anxiety disorders. We studied the course of this disorder in patients who were followed up for 40 years. Patients admitted with the diagnosis of anxiety states to the López Ibor Neuropsychiatric Research Institute between 1950 and 1961 were re-examined using a semistructured interview in 1984-1988 and latter in 198-2001. Mean length of follow-up from onset was 47. Patients were diagnosed as suffering either from Panic Disorder of from Generalised Anxiety Disorder according to DSM-III-R criteria.

In PD improvement was observed in 68%. Among those who recovered, 93% had done so already by the 1980s. Progression to PD with agoraphobia was related to family history of anxiety disorders and onset of panic disorder before age 25. Lack of regular treatment compliance, progression to agoraphobia and number of episodes of panic disorder were associated with worse outcome. Agoraphobia without panic attacks and somatization symptoms were the most prevalent clinical status at follow-up.

In GAD improvement was observed in 83%. Among those who recovered, 95% had done so already by the 1980s. When GAD disappeared it was replaced by somatization disorders. Lack of regular compliance, female and onset of GAD before age 25, were variables associated with worse outcome. Undifferentiated somatization disorder was the most prevalent clinical status at follow-up.

After several decades, PD patients improve with regard to number of panic attacks, though most continue to have residual symptoms (phobic avoidance and somatizations), while GAD patients although improved most continue to have somatizations.
SL-26

CHILD AND ADOLESCENT PSYCHIATRY IN DEVELOPING COUNTRIES

INSTITUTIONS
1. Bangabandhu Sheikh Mujib Medical University (BSMMU), Department of Psychiatry, Dhaka, Bangladesh

AUTHORS
1. Mohammad Sayadul Islam Mullick, Professor, PhD, MRCPsych, FCps, mullick@bdonline.com

In developing world, roughly 40-45% of the population is under the age of 18 years. Few representative studies in the developing countries suggest that 10-20% of children have psychiatric disorders. Some studies have found children in Asia and Africa relatively rarely have conduct problem. Though more methodologically sound epidemiological studies in large scale can refine the estimates, a conservative extrapolation is that around 15% of children and adolescents in developing countries have psychiatric disorders that are severe enough to result in substantial distress and social impairment, thereby warranting treatment. Overall, there is a vast gap between need and provision of child and adolescent psychiatric services in these countries.

The child and adolescent psychiatry in the Developing countries are not prioritized rather ignored and neglected. The opportunity of training and education in this field are limited that caused scarcity of child and adolescent services in terms of manpower, logistic support and multidisciplinary approach. Further, the child psychiatry in Developing countries differs from the Developed countries in many aspects including pattern and presentation of disorders mainly due to socio-cultural and economic status. The children in these countries are subject to large diversity of conditions. Developing countries have limitations along with unique strength. Therefore, child and adolescent psychiatry for the developing countries will likely to be different from Western model.

Developing feasible child and adolescent mental health services in Developing countries is urgent need. It is necessary to identify strengths, resources, challenges and opportunities to restructure child and adolescent psychiatry in Developing countries.

SL-27

PHENOMENOLOGICAL PSYCHOPATHOLOGY OF SCHIZOPHRENIA: SHARPENING OR BLURRING THE FOCUS?

INSTITUTIONS
1. University of Heidelberg, Psychiatry, Heidelberg, Germany

AUTHORS
1. Christoph Mundt, Dr., MD, christoph_mundt@med.uni-heidelberg.de

Objectives: Differential definition of “phenomenology”, elucidation of its methodology, research foci of phenomenology and some characteristic results with regard to schizophrenia.

Methods: Description of concepts, methods and some results based on literature review.

Results: There are four distinct methodologies of phenomenology to be elucidated, the descriptive one (Jaspers), the eidetic one with ideal types (Max Weber), the constitutional one concerning intentionality (Husserl and analytic philosophy) and the ontological one, i.e. deviant forms of existence (most literature related to Heidegger).

The clinical application of these methodologies focuses on the subjective experience. The access to it is sought by empathy and forms of intersubjectivity which generates some proximity to the hermeneutic process. Although focused on subjectivity experience and intersubjectivity there is a claim of objectivity by phenomenologists when phenomena are considered as manifestations of the mental state as, for example, in psychosis or in the art of psychotic patients.

Conclusion: Looking at the phenomenology of schizophrenia the main statements emerging from phenomenology will be reported focussing on the psychic experience of subjectivity, identity, historicity of the person and intentionality.
SL-28

AN URGENT NEED FOR DIALOGUE ABOUT A “GLOBAL EMERGENCY” OF HUMAN RIGHTS VIOLATIONS IN MENTAL HEALTH CARE

INSTITUTIONS
1. MindFreedom International, Eugene, United States

AUTHORS
1. David W. Oaks¹, oaks@mindfreedom.org

The point of view of individuals who have experienced human rights violations in mental health care, and the organizations that represent us, need to be heard by psychiatric professional organizations. Mediated dialogue must be encouraged between groups representing psychiatric survivors and groups representing mental health professionals.

We are not alone. Dr. Benedetto Saraceno, Director of the Department of Mental Health and Substance Dependence at the World Health Organization (WHO), has stated, “The violation of human rights of ... psychiatric services users and the recognition of their role and rights as citizens are a main concern for WHO. WHO thinks that no treatment can be credibly provided in a context which systematically violates human rights. There is a global emergency for the human rights of people suffering from mental health problems.

I insist on the word ‘global’ as people tend to believe that these kinds of violations always occur somewhere else when, in fact, they occur everywhere.”

Certain human rights controversies are especially pressing, such as involuntary electroconvulsive therapy (ECT) against the expressed wishes of the subject, and long-term, high-dosage coerced administration of neuroleptic psychiatric drugs.

In a broader sense, though, if a family with a member in severe crisis is primarily offered psychiatric drugs, when non-drug approaches can work, this too is a kind of coercion. I respect an individual’s right to take prescribed psychiatric drugs. However, being offered only one choice is not really a choice at all. Creating more non-drug voluntary alternatives has become a human rights concern.

SL-29

ETHICS CULTURE AND PSYCHIATRY

INSTITUTIONS
1. Institute of Psychiatry, Ain Shams University, Cairo, Egypt

AUTHORS
1. Ahmed Okasha¹, Dr., MD, PhD, FRCP, FRC, aokasha@internetegypt.com

Objective: The presentation will discuss that diversity of cultural differences should not affect a universal pattern of implementing ethics taking cultural context into consideration. The belief of the universality of implementing similar ethical codes in all cultures and societies is a mirage. Informed consent, involuntary admission and confidentiality are not so empowering in some traditional and Eastern societies. Autonomy versus family centered decision is one of the main differences between Western and Eastern societies. The influence of managed care and the third party in mental health services have changed not only Doctor-patient relationship, but also confidentiality. Informed consent in therapeutic alliances and research became a basic human right and has been emphasized in the WPA Declaration of Madrid and its specific guidelines. Encounters between psychiatry and law keep bringing us back to our conflicting conceptions of the value of health on the one hand and the value of liberty, integrity and autonomy on the other. In traditional cultures, social integration is emphasized more than autonomy; that is, the family, not the individual, is the unit of society. Dependence is more natural and infirmity is less alien in these cultures. When affiliation is more important than achievement, how one appears to others becomes vital. How can we practice without showing disrespect or disregard for local values? On the other hand, how can we ensure that respect for the local culture does not become a pretext for bypassing ethical guidelines, to the detriment of patients’ rights?

PSYCHIATRY IN CZECH REPUBLIC

INSTITUTIONS
1. Charles University, Department of Psychiatry, Prague, Czech Republic

AUTHORS
1. Jiří Raboch, Mr., MD, raboch@cesnet.cz

Profound political, social and economic changes after the fall of iron
curtain in Central Europe influenced also substantially Czech psy-
chiatry. In the socialist Czechoslovakia the health care system was
fully state owned, state paid and organised in so called regional insti-
tutes of health care with obligatory catchment areas comprising in-
patient as well as out-patient care facilities including psychiatry. The
main trends after the 1989 changes were decentralisation of the health
care system, rapid privatisation especially of outpatient services
and financing through the newly set up health insurance corpora-
tions. In recent years the number of physicians working in psychiatry
has been increasing and in January 2007 there were 1 313 of them
mostly working in outpatient's clinics. There was no period of rapid
denationalisation in the Czech Republic, but the number of psychi-
atrie beds was substantially reduced in the last decade. There are
no official statistics regarding community psychiatry. Protection of
human rights and dignity of people suffering from mental disorders
is a very important issue in our country. In the Czech law there is
not a specific act on mental health. However, all detentions are con-
trolled by independent courts and every psychiatric institution has
transparent and strict rules how to use coercive measures. The prob-
lem is, that the number of auxiliary nurses and other health care
personal is rather low in Czech psychiatric facilities and frequently
no other technical support is available. Less than 4 % of the health
care budget goes to psychiatric care.
SL-32
IS SUICIDE PREVENTABLE IN THE FRAME OF HEALTHCARE?

INSTITUTIONS
1. Semmelweis University, Budapest, Hungary

AUTHORS
1. Zoltan Rihmer, Prof, MD, PhD, DSc

Suicidal behaviour is relatively rare event in the community, but quite common among psychiatric patients who contact different levels of healthcare some weeks or months before the suicidal event. The most common current psychiatric illness among consecutive suicide victims is major depressive episode (56-87%), which, in the majority of cases, is unrecognized or untreated. Since successful acute and long-term pharmacotherapy of depression significantly reduces the risk of both attempted and completed suicides, and 34-66% of suicide victims (two-thirds of them have current depression) contact their GPs 4 weeks before their death, GPs play a priority role in suicide prevention. Followed the pioneering Swedish Gotland Study, several large-scale community studies demonstrated that education of the GPs on the diagnosis and treatment of depression, particularly in combination with public education, improved the correct identification and appropriate treatment of depressive disorders and reduced the frequency of suicide attempts and committed suicides in the areas served by trained GPs. Clinical follow-up studies on severely ill formerly hospitalized patients with unipolar and bipolar major mood disorders, performed in the frame of outpatient psychiatry, have shown that long-term pharmacotherapy with antidepressants and/or mood stabilizers markedly reduced the risk of attempted and completed suicide even in this high-risk population. Although appropriate pharmacotherapy of mood disorders is essential for suicide prevention, the importance of alcoholism and other psychiatric and psycho-social suicide risk and protective factors should be also considered.

THE ROLE OF MIGRATION ON MENTAL HEALTH AND MENTAL ILLNESS

INSTITUTIONS
1. University of Texas Health Science Center, Psychiatry (pedro.ruiz@uth.tmc.edu), Houston, Texas, United States

AUTHORS
1. Pedro Ruiz, Professor, MD, pedro.ruiz@uth.tmc.edu

AIMS/OBJECTIVES
1. To understand the role of acculturative stress in migration.
2. To learn how to manage acculturative stress.
3. To learn and identify the psychiatric disorders most commonly produced by acculturative stress.

Since World War I, a steady and increasing migratory process towards industrialized nations, especially the United States has been observed. More recently, the globalization process that is taking place all over the world has accelerated this migratory process, especially in the European Union. As a result of these two processes, migrants have been exposed to increased levels of acculturative stress. The results of acculturative stress have led to an increase in the presence of mental disorders and conditions among these migrant groups. Additionally, the ethnic, racial and cultural characteristics of these migrant groups have led to complex and difficult to diagnose and treat psychiatric disorders; many of them characterized as culture-bound syndromes.

In this lecture, the definition, manifestation and management of acculturative stress will be addressed and discussed. Additionally, focus will be given to the most common psychopathological disorders resulting from acculturative stress, as well as the best methods or approaches to understand and treat them. Hopefully, this lecture will lead to a better quality of psychiatric care being offered to these migrant groups, any of whom belong to low socioeconomic levels.

PSYCHIATRY, SOCIETY AND PUBLIC MENTAL HEALTH - TIME FOR RETHINKING AND RESPONSIBILITY TAKING

INSTITUTIONS
1. Uppsala University Hospital, Uppsala, Sweden
2. University of Coburg, Coburg, Germany

AUTHORS
1. Wolfgang Rutz1,2, Professor, MD, PhD, wolfgang.rutz@akademiska.se

Context: Recently perspectives on mental health and mental disorder have moved - from a focus on individual etiology, phenomenology and consequences of mental disorder to a perspective including the societal causes and manifestations of mental ill health as "community syndromes" of disorder, death, dysfunction and suffering.

Key messages: Transitional stress load in individual life and the society as a whole leads to distortion, disorder and break down of adaptation mechanisms, coping ability and impulse regulation - against the background of structural vulnerability in individuals and society. Hitherto, professional and political strategies to prevent mental disorder and to promote resilience often focus on "healthy choices", to be made by the individual in individual responsibility, whereas a focus on the responsible obligation of societies and their political decision makers to make political "healthy choices" lacks in the political discussion. A new type of public mental health promotional thinking is demanded, allocating resources as well as intellectual, professional and political capacity to realize human ecological principles of a mental health promoting environment in society.

Conclusions: Mental ill health not only understood as an individual condition but addressed as a societal phenomenon demands a political focus on human ecology and well-known pre-conditions necessary for human functioning. It must be supported in societal public mental health promotion. Psychiatry is challenged.

EPIDEMIOLOGICAL EVALUATION OF COMPREHENSIVE HEALTH

INSTITUTIONS
1. Instituto Nacional de Salud Mental Peru, Specialized Research and Teaching Bureau, Lima, Peru
2. Universidad Peruana Cayetano Heredia, Departamento de Psiquiatria y Salud Mental, Lima, Peru

AUTHORS
1. Javier E Saavedra1,2, Dr., MD, DrMdSc, saavedra@terra.com.pe

Some authors have sustained that the current classificatory systems serve the biomedically oriented investigator and not the clinician who approaches the patient as individual, from a peculiar perspective of his life and his personality. Recently the World Psychiatric Association (WPA), followed by the Latin American Psychiatric Association, has proposed a more comprehensive approach to diagnosis, the IGDA project. This approach considers two diagnostic levels: the first one is a standardized multiaxial diagnosis that describes the patient’s illness and the patient’s clinical condition through typologies and standardized scales; and the second one is an idiographic diagnostic formulation that supplements the standardized formulation with personalized and flexible statements. This presentation will center around to the results of a population base epidemiological study which integrated the WPA diagnostic proposals and other positive aspects of health as part of an assessment which includes an idiographic formulation.

The study consisted of a face-to-face household survey of 6555 community aged 18 years and older residents in five cities of the coast of Peru from August-December 2006, selected through a probabilistic three-stage sample procedure. Comprehensive assessment included an adaptation and complementation of the IGDA diagnostic suggestions through the following instruments: the MINI International Neuropsychiatric Interview ICD-10 version, the Quality of Life Index, the Mental Health Questionnaire elaborated in Colombia, and a validated Idiographic Formulation Questionnaire. Relational statistical analyses between the different components of the diagnostic formulation and other positive aspects of health will be presented, discussed and contrasted to previous studies in different cities of this multicultural country.

TREATMENT OF MAJOR DEPRESSION WITH COMORBID SUBSTANCE ABUSE: REVIEW OF THE EVIDENCE

INSTITUTIONS
1. University of Miami Miller School of Medicine, Psychiatry, Miami, FL, United States

AUTHORS
1. Ihsan M. Salloum, MD, MPH, isalloum@med.miami.edu

Goals: Major depression complicated by an addictive disorder is among the most frequent comorbidity encountered in clinical settings. Although, this form of comorbidity has been the most studied to date, optimal treatment guidelines are still lacking. This presentation will review current evidence for effective treatments as reported by pharmacological trials specifically conducted to address this comorbidity and it will also discuss results emerging from most recent trials evaluating combined pharmacotherapy for major depression with alcoholism.

Methods: Studies were identified through computerized literature searches and refereed articles published from January 1966 through January of 2007. Randomized, placebo-controlled trials and open-label studies with large samples or those reporting novel approaches were selected for the review.

Results: The search identified twenty-seven studies, 23 of which were randomized, double-blind, placebo-controlled trials. Overall, treatment response was inconsistent among the different trials. More trials reported improvement for depression than improvement for substance use and rarely reported improvement in both outcomes. Trials with non-serotonergic reuptake inhibitor antidepressants reported more positive findings than those with SSRIs. Response varied by type of medication and study design. Combined pharmacotherapy trials may be an innovative option but requires further methodological refinement.

Conclusions: Antidepressants may provide improvement for depression when comorbid with substance use. There is less evidence of improvement for the substance use outcome, and there was rarely improvement on both outcomes. Addressing methodological challenges in future clinical trials is crucial for providing more consistent results that allow the construction of evidence-based algorithm for optimized interventions in this population.

PSYCHIATRIC CARE NEEDS IN INTELLECTUAL DISABILITIES: FILLING THE GAP

INSTITUTIONS
1. University of Cadiz, Neurosciences, Cadiz, Spain

AUTHORS
1. Luis Salvador-Carulla, Dr, MD, luis.salvador@telefonica.net

In medicine, it is difficult to find a case similar to intellectual disability (ID) or Mental retardation. It is a frequent condition which is associated to multiple disabilities and other medical problems and it has consequences all along the life-span, imposing a considerable burden on families and caregivers. Over 30% of persons with ID experience a comorbid psychiatric disorder; they require high service provision and produce high health and societal costs. However, most of their care needs remain unmet, and ID has been largely disregarded as a mental health issue. In the last years information produced by a series of international projects has contributed to improve the knowledge base of this condition within the mental health sector: 1) Progress in classification and diagnostic assessment of ID within psychiatry; 2) Improvement of health and mental health indicators (POMONA project); 3) A better information on critical issues related to ID such as the terminology, funding, care patterns, legislation and training (WHO Atlas for Intellectual Disabilities); 4) A better knowledge of service provision and balance of care compared to other mental health problems and to other disability groups (DECLOC Project). This information facilitates planning and implementation of new specialised mental health services in several countries. The evidence-base national strategy for MH-ID services in Spain is a model on how to develop an evidence-base MH care system for ID.

WHO’S MENTAL HEALTH PROGRAMME FOR LOW AND MIDDLE INCOME COUNTRIES

INSTITUTIONS
1. WHO, mental health, Geneva, Switzerland

AUTHORS
1. Benedetto Saraceno, Dr, MD, saracenob@who.int

WHO has recognized the need for action to reduce the burden of MNS disorders worldwide, and to enhance the capacity of Member States to respond to this growing challenge. In 2001, national and international institutions and organizations, the public health community, and other stakeholders were reminded of the issue of mental health (World Health Day, World Health Assembly, and World Health Report). The WHO Mental Health Global Action Programme (mhGAP) followed from these events to provide a coherent strategy for closing the gap between what is urgently needed and what is available to reduce the burden of mental disorders worldwide. mhGAP was endorsed in 2002 by the 55th World Health Assembly which urged Member States to increase investments in mental health. The mhGAP is now in the implementation phase and its objectives are: To reinforce the commitment of governments, international organizations, and other stakeholders to increase the allocation of financial and human resources for care of mental disorders. To achieve much higher coverage with key interventions in the countries with low and lower middle incomes that have a large proportion of the global burden of mental disorders. To promote the human rights of people suffering from mental disorders through innovative policies and service organizations.

STIGMA, MENTAL ILLNESS AND MENTAL HEALTH

INSTITUTIONS
1. Association for the Improvement of Mental Health Programmes, Geneva, Switzerland

AUTHORS
1. Norman H. Sartorius, Professor, MD, MS, PhD, sartorius@normansartorius.com

Stigma is gradually becoming recognized as the chief obstacle to the development of mental health programmes and the provision of care to people with mental illness. The World Psychiatric Association as well as other organizations have carried out international projects on stigma related to mental illness demonstrating that such programmes can be successful even in situations of great financial scarcity. This lecture will describe some of these projects and present possible directions for future work in this field.

PHILOSOPHY OF SCIENCE IN BIOLOGY, MEDICINE AND PSYCHIATRY

INSTITUTIONS
1. University of Pittsburgh, HPS, Pittsburgh, United States

AUTHORS
1. Kenneth F Schaffner¹, Dr, MD, PhD, kfs12@comcast.net

This Special Lecture examines the roles that philosophy of science plays in biology and medicine, with special application to psychiatry. Interestingly, though the philosophy of biology as a subfield of philosophy of science has flourished in the past 30 years, the philosophy of medicine has remained fairly constant during this period. However, the philosophy of psychiatry has undergone significant growth, particularly in the past fifteen years. Themes in philosophy of psychiatry borrow from both philosophy of biology and philosophy of medicine, and include the definition of disease and disorder, problems of classification, issues of causation, the nature of validity, and the relation of mind to brain. The last problem has stimulated extensive discussions about reductionism and emergence. This Lecture reviews these philosophical issues, and points the way toward places where philosophy may be of assistance in psychiatry, including in the DSM-V and the ICD-11 revision processes.

PERSONHOOD AND SUFFERING

INSTITUTIONS
1. Imperial College, Department of Psychological Medicine, London, United Kingdom

AUTHORS
1. Tom Sensky¹, Professor, FRC Psych, t.sensky@imperial.ac.uk

The concept of Personhood will be introduced as a key element in Psychiatry for the Person. While ‘Self’ is often used as a synonym for Personhood, it will be demonstrated that these terms in fact refer to different concepts. An understanding of Personhood is particularly important in assessing and managing suffering. Although the alleviation of suffering is widely regarded as an integral part of medicine for the Person, there are problems in managing suffering because suffering as a term has been widened to the extent that it is commonly used to describe any experience of any illness. However, suffering can be appropriately conceptualised as arising from a significant threat to an individual’s Personhood. With emphasis on psychosomatic medicine, some clinically useful concepts will be reviewed that contribute to Personhood and Suffering, and a framework proposed to assist in assessing and managing suffering.

THE ECONOMICS OF MENTAL HEALTH CARE IN THE 21ST CENTURY

INSTITUTIONS
1. Sheppard Pratt Health System, Baltimore, Maryland, United States
2. University of Maryland, Department of Psychiatry, Baltimore, Maryland, United States

AUTHORS
1. Steven S. Sharfstein1,2, Dr., M.D., ssharfstein@sheppardpratt.org

The field of mental health economics has matured and grown over the past ten years to the point that the field is able to ascertain the costs of mental illness as both direct and indirect, the cost effectiveness of various interventions, and the impact of financial policies on access, quality, and costs of care. It is possible today to do cross-national comparisons and to use the benefits of research in mental health economics in designing policy for the financing of cost-effective treatments and for the income support to sustain individuals and families who are coping with the ravages of severe and persistent mental illness. This paper will review the progress that has been made in mental health economics and project future work into the new millennium.

BIOLOGY OF PERSONALITY DISORDERS

INSTITUTIONS
1. Mount Sinai School of Medicine, Psychiatry, New York, United States

AUTHORS
1. Larry J. Siever1, Dr., MD, Larry.Siever@va.gov

Studies of the biology of personality disorders has attracted increasing interest in the last two decades. Advances in molecular genetics, imaging, and neuropharmacology have made it possible to identify critical pathways altered in the key dimensions of personality disorders and how these are modulated by neurotransmitters. Prefrontal cortical inhibition of amygdala and other limbic structures may be important for impulse and affective regulation with serotonin facilitating or modulating the topdown control of these domains through structures like anterior cingulate and orbital frontal cortex. Serotonergic probes demonstrate alterations in the serotonergic modulations of these areas and components of the serotonergic system like the serotonin transporter are associated with impulsivity (reduced transporter with impulsive aggression). Candidate genes in the serotonin system including the serotonin transporter and the SHT2A receptor have been associated with dimensions of impulsivity and/or specific diagnosis such as borderline personality disorders, although reports in this area are not consistent. Dopaminergic neurotransmission modulates efficiency of more lateral prefrontal cortical structures implicated in the organization of cognition. Agents which enhance dopamine release may be associated with improved cognitive performance in schizotypal personality disorder (SPD) and new studies identify potential abnormalities in D1 receptor binding and amphetamine displacement of raclopride. Implications of these neurotransmitter/neuroncircuit studies for pharmacologic treatment interventions will be discussed.

PSYCHIATRIC TRAINING - PATIENT FOCUSED TRAINING (EVOLUTION OR REVOLUTION)

INSTITUTIONS
1. European Federation of Associations of Families of People with Mental Illness (EUFAMI), Executive Committee, Leuven, Belgium

AUTHORS
1. Sigrid Steffen¹, Ms, secr.general.office@eufami.org

Context: The focus to date on training in the profession has been on the illness, symptoms and treatment. Which is acceptable up to a point. But there is a cost involved to be paid. EUFAMI would contend that it is at the cost of the patient, who sometimes can be the forgotten party in the whole affair.

Objective: Shift the focus of Psychiatric Training to more patient focused training

Key Messages: EUFAMI will make the case for the need for training to shift from a medical centred focus to a patient centred focus. EUFAMI would contend that a seed change in training and training methods for psychiatry is required. Firstly shift the emphasis from the illness to the patient (user). In other words, training should be patient focused.

This shift could be achieved by updating the current standards for the curriculum. New modules need to be introduced to cover human aspects related to the user and family, which will result in a seed change, and thereby allow all interested parties to fully participate in the care team on the road to recovery. Also the most important parties, namely the users and their families, will feel valued and not feel mere onlookers.

Conclusion: A better and easier life for all concerned - service user will feel more involved and take ownership; the medical profession will feel more relaxed and life will be easier as there will be more dialogue; the family member will feel valued and a reduction in isolation.

ANXIETY DISORDERS: NEURONAL CIRCUITRY, MOLECULAR UNDERPINNINGS, AND PSYCHOSOCIAL TRAJECTORIES

INSTITUTIONS
1. University of Cape Town, Psychiatry & Mental Health, Cape Town, South Africa

AUTHORS
1. Dan J. Stein¹, Prof, MD, PhD, dan.stein@uct.ac.za

There are important clinical reasons for focusing on the anxiety disorders - they are the most prevalent of the psychiatric disorders, and amongst the most disabling. The introduction of effective and cost-efficient interventions for generalized anxiety disorder, obsessive-compulsive disorder, panic disorder, posttraumatic stress disorder, and social anxiety disorder has gone some way to improving diagnosis and prognosis. Much of the excitement about recent work on anxiety disorders derives, however, from our increasing ability to move from bench to bedside, translating laboratory findings into clinical approaches. Translational research is increasingly allowing us to address and to integrate multiple levels of data on anxiety disorders, and a synthesis of work on neuronal circuitry, molecular underpinnings, and psychosocial trajectories is emerging. The anxiety disorders provide an important "tool-with-which-to-think" about recent advances in modern psychiatry, as well as about the limitations of our current knowledge base. Where relevant, data from the South African context, which has a number of remarkable and unique features, will be used to exemplify the arguments put forward.

Mental Health Advocacy - The Way Forward

Institutions
1. University of Cape Town, Social Development, Cape Town, South Africa

Authors
1. Shona Sturgeon

Worldwide, promotion of mental health and the prevention and treatment of mental disorders have been neglected and under-resourced and mental illness is still stigmatised. This is despite current knowledge and evidence regarding the burden of mental disorders; risk and protective factors; the connection between mental disorders and other health and social conditions, and the positive outcomes of promotive, preventive and treatment interventions. In low and middle-income countries, this neglect is experienced even more acutely, often constituting human rights violations.

It appears that international organizations, governments and funders lack the political will to adequately address mental health issues. This paper suggests there is increasing recognition that strong, targeted advocacy by a variety of players is required to create the public pressure needed to persuade these bodies to place mental health higher on their list of priorities and to address issues of stigma and discrimination.

The Lancet Series on Global Mental Health provides a strong evidence base to inform such advocacy and makes a call for scale up services for mental disorders (Lancet September 2007). The World Federation for Mental Health, an organization with a long history of advocacy, has chosen to highlight the Lancet information and messages in the 2008 World Mental Health Day campaign, "Making Mental Health a Global Priority - Scaling up Services through Citizen Advocacy and Action".

The Identity of the Psychiatrist in the 21st Century

Institutions
1. University of Louisville, School of Medicine, Louisville, United States

Authors
1. Allan Tasman

Scientific advances in psychiatry over the last century have been dramatic, but there has been a concomitant de-emphasis on a biopsychosocial approach to understanding and intervention for psychiatric disorders. For example, the DSM diagnostic changes emphasize symptom checklist approaches to psychiatric diagnosis; neuroscience and psychopharmacology gains emphasize somatic interventions; delivery system changes, and inadequate availability of psychiatrists, diminish attention to the psychological aspects of the patient's presentation and treatment. This lecture will argue for the benefits of a re-emphasis on a comprehensive biopsychosocial model of understanding in the clinical setting, which will encompass a number of positive patient care results. Clearly, compliance with treatment is enhanced when the treatment occurs within the context of a trusting therapeutic alliance with a skilled, psychologically minded, and empathic clinician. Attention to psychological factors and developmental stresses allows for a more thorough understanding of psychopathology. In addition, research studies have demonstrated the superiority of combined psychotherapeutic and psychopharmacologic treatment over one-dimensional interventions, especially for seriously ill patients. Recent neuroscience advances in support of a biopsychosocial frame of reference will be reviewed. Implications for psychiatric training will also be discussed. A key task for psychiatry will be the integration of the best of our humanistic traditions with the latest scientific advances as we continually refine our professional identity.

PATHWAYS OF PSYCHOPATHOLOGY: FROM INFANCY TO ADULTHOOD

INSTITUTIONS
1. Tel Aviv University School of Medicine, Tel Aviv, Israel

AUTHORS
1. Sam Tyano¹, styano@post.tau.ac.il

One of the major issues in Child and Adult Psychiatry today, is the understanding of the pathways of development and change of psychopathology along the course of life. The major difference between the developmental psychopathology viewpoint and the traditional perspective of psychiatry is its conceptualization of mental disorder not as an inherent trait that resides in an individual but as something that emerges from the dynamic interplay between intra-individual and extra-individual contexts.

In addition, issues of time and timing are essential in understanding the confluence of an individual’s past experiences with present circumstances in predicting future adaptation. Patterns of continuity and discontinuity over development are especially interesting; change is always thought possible with the caveat that the likelihood and degree of change is constrained by prior history and the current context. This concept is reflected in the prevalence of psychiatric disorders from age 2 years to adulthood, where almost any psychiatric disorder can start at a very young age, though prevalence of specific disorders change over time. Core concepts of transactional model, vulnerability and risk factors, sensitivity, resilience and protective factors, gene-environment interplay, will be used to try and explain some major evidence-based differences in the course of childhood-onset versus adolescence-onset disorders. Patterns of homotypic continuity, heterotypic continuity and discontinuity will thus be illustrated.

REVISION OF INTERNATIONAL CLASSIFICATION OF DISEASES

INSTITUTIONS
1. World Health Organization, Classifications and Terminology, Geneva, Switzerland

AUTHORS
1. Bedirhan Ustun¹, dr., ustunb@who.int

The ICD-11 revision will proceed in three stages: (1) systematic review of scientific, clinical and public health evidence relevant to classification, (2) creation of a draft ICD-11 and field-testing it (3) development of meaningful linkages to standardized health care terminologies to facilitate communication, standardized data processing and research. The traditional form and uses of the ICD for mortality and morbidity reporting will be maintained. To assist additional needs of different users the revised classification will have three interoperable formats for primary care, clinical specialty and research. To represent knowledge adequately the classification will be built using ontological tools that include various domains such as constellations of signs and symptoms, severity and course, as well as genetic and other information. This approach will also enable standardized information processing by computers in e-health applications. The International Classification Functioning Disability and Health (ICF) and national modifications of ICD will be included to improve the ICD content. The revision process will make use of distributed web-based tools to collate suggestions, discussions and evidence. Secondly, a structured Wiki-like tool will be used to generate the successive drafts of ICD-11. Users will engage in field trials through the global web based platform.

Currently a Revision Steering Group has been established as an oversight mechanism. Each main area of revision will be worked through a topic advisory group and multiple workgroups. Following this roadmap we expect to arrive at a desired product that not only serves as a classification system but also as a building block for health information systems.

THE FACE OF MENTAL HEALTH PROBLEMS IN PRIMARY CARE

INSTITUTIONS
1. WONCA, President

AUTHORS
1. Chris van Weel

Mental health problems form a substantial part of illness and disease encountered in primary care, and family physicians carry the lion’s share of their diagnosis, treatment and management. Depression, anxiety disorders and sleep problems are the most common mental health problems in this context, but an issue of concern in primary care are medically unexplained (physical) symptoms. In particular when this takes a chronic course, the negative impact on patients’ health and wellbeing is high. For diagnosis and treatment, the integration of physical/somatic and personal/psychological competences is essential to cope with the ‘body-mind anomaly’. This makes it mandatory to provide care of mental health problems in the main stream of medicine. Another reason for this integration is co-morbidity or multi-morbidity: patients suffering simultaneously from two or more chronic health problems. Combined presence of diabetes, or COPD, and depression has implications for the prognosis and the treatment options, and should shift the focus from ‘disease management’ to person-centred care.

These are strong reasons to promote, for mental health problems, a central role of primary care: provided from a generalist perspective; in an on-going professional working relation over time; in the direct vicinity of where patients live; taking into account the family, cultural and social circumstances. Effective treatment and management in primary care requires insight in the severity and prognosis, and the primary care population is characterized by a wide range of disease severity. The recurrence rate of depression in primary care is relatively low, and this points to a generally favorable prognosis. But at the same time, the impact on the patient’s quality of life is substantial. This requires the further study and testing of treatment in the primary care population.

SERVICE-USERS RECONCEPTUALISING THE ROLE OF PSYCHIATRY IN THE 21st CENTURY

INSTITUTIONS
1. South Bank University, School of Nursing, London, United Kingdom

AUTHORS
1. Jan L. Wallcraft, Dr., PhD, loujan03@yahoo.co.uk

Aims/objectives
Foucault wrote about how the discourse of psychopathology was created in the 19th Century. I have explored challenges to that discourse in 20th Century from psychosocial perspectives.

I observed the emergence of a new social movement of mental health service patients and users. I aim to explore the extent to which this movement creates a new discourse and new role for psychiatry.

Methods
Literature review including grey literature of individual experiences
Action research, working with service users to create alternatives to hospital
Narrative enquiry
Focus groups and one to one interviews

Results
I have found that in the UK the service user movement exists as a potential new social movement, though it needs investment in capacity building.

Worldwide the service user movement is creating a discourse which is fundamentally different from the traditional discourse of psychopathology and challenges its basic epistemology.

Conclusions
The new discourse is based on self determination, empowerment, choice, self-management of problems and service-user defined outcomes.

Service users cannot be empowered without fundamental changes in how mental illness is conceptualised and categorised, e.g. diagnostic systems

Existing structures of power and knowledge in mental health/mental illness also need to be challenged to allow the service user discourse to emerge and develop.

Around 450 million people in the world suffer from psychological problems and mental disorder. Five of the ten leading causes of disability and premature death worldwide are psychiatric conditions. The South Asian region is the most populous with 23 percent of the world’s population and amongst the poorest regions in the world. There is growing epidemiological evidence of a high burden of mental disorders.

There are various researches which validate the role of family and other informal supports in the care of chronically ill psychiatric patients. It has led to understand and focus our attention in knowing the dynamics of the situation and making an attempt to discover ways for improving the outcome of the illness. Family studies have explored the burden that caregiver experience that their loved ones are suffering from psychiatric disorders in the form of perception of strain, reduced morale, anxiety and depression. The major concerns include disruptions during acute episodes, fear of violence, worsening of marital relationship, financial and legal problems.

During the past two decades, the trend has changed in treating psychiatric patients. The policy of treating patients in their family settings reduces the cost and may help early recovery and prevent chronic relapses. Family interventions have been found to improve patients’ compliance to antipsychotic drug treatments, and to reduce the overall economic costs of care. The family has to face new challenges with this changing trend. During this symposium we will discuss few of these challenges associated with mental disorders especially in South Asia.

MENTAL DISORDERS AND BURDEN OF CARE ON FAMILY MEMBERS: AN ASIAN PERSPECTIVE

INSTITUTIONS
1. C.S.M. Medical University (Formerly K.G. Medical University), Psychiatry, Lucknow, India

AUTHORS
1. Jitendra Kumar Trivedi1

About 25% people are affected by behavioral disorders during their lives. Five of the ten leading causes of disability and premature death worldwide are psychiatric conditions. The South Asian region is the most populous with 23 percent of the world’s population and amongst the poorest regions in the world. There is growing epidemiological evidence of a high burden of mental disorders. Rates of disorders such as depression and anxiety reported from the region are amongst the highest in the world.

There are various researches which validate the role of family and other informal supports in the care of chronically ill psychiatric patients. It has led to understand and focus our attention in knowing the dynamics of the situation and making an attempt to discover ways for improving the outcome of the illness. The major concerns include disruptions during acute episodes, fear of violence, worsening of marital relationship, financial and legal problems. The recent studies have shown that the relatives or family members of the chronic mentally ill patients want more information and involvement in treatment decisions, good relationship with the care providers, good co-ordination among the services and more intensive and supportive interventions.

During the past two decades, the trend has changed in treating psychiatric patients. The policy of treating patients in their family settings reduces the cost and may help early recovery and prevent chronic relapses. The family has to face new challenges with this changing trend. The presentation highlights these challenges associated with mental disorders in South Asia.
STRESS OF CARING FOR AN ELDERLY WITH MENTAL DISORDER IN AN ASIAN FAMILY

INSTITUTIONS
1. Faculty of Medicine, National University Hospital, 5 Lower Kent Ridge Road, Department of Psychological Medicine, Singapore

AUTHORS
1. Ee Heok Kua

There is a growing concern about caring for an increasing number of the frail elderly in Asia. Kua and Tan (1997) studied 50 family caregivers of elderly Chinese patients with dementia in Singapore, 28 (56%) scored five points or more on the 28-item General Health Questionnaire (GHQ). The GHQ scores correlated significantly with duration of care; presence of delusion, hallucination, depression, insomnia, incontinence and agitation; and the total score of the Behavioural Pathology in Alzheimer’s Disease Rating Scale. On multiple regression analysis the only variables to achieve a significant relationship with the GHQ scores were duration of care, depression and the total behavioural score.

In a recent study, we found that the stress of care-givers of elderly with depression was much higher (75%) compared to those with dementia (56%). More care-givers in the former group expressed irritability and guilt, but in the latter group, the common symptoms were low mood and anxiety. Caring for the frail elderly in Asia will continue to rest on the family in the future. Carers need to seek help outside the home. Community and governmental supports are necessary to alleviate the burden of the family. Although there are only a few old people’s homes or day centers in Singapore, families may not be eager to use these services because to send an elderly relative to these centers imply a failure of responsibility (Kua, Ng & Goh, 2004).

INCORPORATING FAMILY MEMBERS IN MENTAL HEALTH CARE IN CHINA

INSTITUTIONS
1. Chinese Society of Psychiatry, Psychiatry, China

AUTHORS
1. Zhou Dongfeng

In China, family members of mentally ill persons are incorporated by a special association, China Association of People with Mental Illness and their Families and Relatives (CAPMI), which is attached to China Disabled Persons’ Federation. Besides CAPMI, there are many local associations of people with mental illness and their families and relatives in every major city of country which develop the work concerning mentally ill persons and their family members under the guidance of the CAPMI. The common purpose of such associations is to propagate humanism, and ensure the legitimate rights and interests of mentally ill persons and their family members, make them participate in social life and share material and cultural achievements of society equally.
THE ASIAN FORUM AND ITS IMPACT ON PARTICIPATING COUNTRIES

INSTITUTIONS
1. Chairman Asia Region WFSAD, New Zealand

AUTHORS
1. Jim Crowe

This will be the first presentation of the work that is being done in Asia through The Asian Forum. This Forum has now been meeting for six years. Some 10 Asian countries attend. The aim of the forum is to improve access to effective treatments, service and support throughout the Asia-pacific region for people with mental illness and their families, through the promotion of advocacy skills.

The objectives are to support the development and sustainability of community organisations in the Asia-Pacific region for the mentally ill; to increase participants knowledge of, and skills in, effective advocacy activities; to identify a range of strategies which effectively address the stigma associated with mental illness; to develop a support network of interested people to maintain activity in this area. Each year the countries come together to share their year’s achievements and to plan activities for the coming year. This is done in the spirit of collaboration and genuine goodwill. From time to time the participants arrange exchange visits between the participating countries.

This presentation will outline the many changes that have taken place over the past six years within the participating countries. The countries are China, Hong Kong, India, Korea, Malaysia, New Zealand, Philippines, Singapore, Taiwan and Thailand.

2. University of Ferrara, Section of Psychiatry, Ferrara, Italy
3. FLENI, Department of Psychiatry, Buenos Aires, Argentina
4. Temple University, Psychiatry, Philadelphia, United States
5. University of Michigan, Psychiatry, Ann Arbor, United States

AUTHORS
1. Michelle B. Riba, Dr., MD, mriba@med.umich.edu
2. Luigi Grassi, Dr., MD, luigi.grassi@unife.it
3. David Baron, Dr., MEd, Dobar@temple.edu
4. Rodolfo Fahrer, Dr., MD, fahrer@ciudad.com.ar
5. John F. Greden, Jr., MD, gredenj@med.umich.edu

Objectives:
1. Identify major topics in psychosomatic medicine addressing depression
2. Understand opportunities and issues on screening and detecting depression in co-morbid medical illness
3. Identify steps the University of Michigan has taken to build a Depression Center and develop a National/Global Network of such centers.

Depressive disorders are common in primary care settings and are more prevalent in patients with chronic medical illnesses. We will present some of the work being done to screen and detect depression in co-morbid medical illness and the efforts to develop a national/global network of depression centers.
THE DIMENSIONS OF PSYCHOSOCIAL MORBIDITY IN CANCER: BEYOND DSM-V

INSTITUTIONS
1. University of Ferrara, Section of Psychiatry, Ferrara, Italy

AUTHORS
1. Luigi Grassi, Dr., MD, luigi.grassi@unife.it

Objectives:
Literature relative to psychiatry in oncology has debated remarkable issues as far as the diagnosis of psychiatric morbidity in cancer care is concerned (e.g. Major Depression, Adjustment Disorders with Depressed Mood, the vast and vague area of “Other situations deserving clinical attention”). The usefulness of the Diagnostic Criteria for Psychosomatic Research (DCPR) in oncology has been examined as a further tool to identify psychosocial dimensions in cancer care.

Methods:
Data of some studies involving cancer patients (n=112) and patients with medical disorders (n=800) to whom the DSM-IV and the DCPR were applied during their admission in the hospital.

Results:
Demoralization and health anxiety appeared to be the most common dimensions, not necessarily related to major depression or other DSM-IV diagnoses both in cancer patients and medically ill patients. A high percentage (35-47%) of patients not meeting the criteria for any DSM diagnosis presented symptoms related to one or more DCPR dimensions.

Conclusions:
Dimensions related to abnormal illness behaviour (e.g. health anxiety, hopelessness, demoralization) and to alexithymia and Type A behaviour should be part of the assessment of medically ill patients, especially cancer patients, in psychosomatic medicine.

THE ROLE OF PSYCHIATRY IN TREATING PATIENTS WITH CHRONIC KIDNEY DISEASE

INSTITUTIONS
1. Temple University School of Medicine, Psychiatry, Philadelphia, Pennsylvania, United States

AUTHORS
1. David Baron, Dr., MEd, DO, dbaron@temple.edu

Objectives:
The goals and objectives of this presentation are to review the role of psychiatrists in providing care for patients in chronic kidney failure and discuss the challenges often encountered in the patient population.

Method:
The presentation is based on a review of the extant literature and personal experiences of the author. Virtually all transplant teams include a psychiatrist/psychologist to screen potential recipients and donors for psychiatric clearance prior to surgery. This presentation will review the salient issues and unique psychiatric issues which present in this clinical setting.

Results:
Psychopathology is an important issue to address in chronic renal failure patients. All patients awaiting transplant should be screened psychiatrically pre-transplant and followed post op. The need to comply with post surgical medications, diet and lifestyle are critical to survival. The emotional health of the patient is an independent factor in determining the long term outcome and must be addressed in all patients. The mental health workers must be an integral component of the treatment team.

Conclusions:
The role of depression, reactive dysphoria, and adjustment disorder with depressed mood will be discussed, along with treatment recommendations for each. The importance of establishing a team approach to care will be highlighted along with clinical case examples.

DEPRESSION IN NEUROLOGICAL ILLNESS

INSTITUTIONS
1. FLENI, Psychiatry, Buenos Aires, Argentina

AUTHORS
1. Rodolfo Fahrer¹, Dr., MD, fahrer@ciudad.com.ar

Objectives:
Psychiatric and cognitive abnormalities are part of neurological diseases, and overall they are similar to those we find in primary psychiatric illness. To improve our understanding of common psychiatric conditions, it is important to study these psychiatric manifestations and their neural substrates.

Neurological diseases associated with depression can be categorized into three main groups: 1) focal lesions; 2) degenerative diseases with diffuse or random pathology, and 3) degenerative disorders with regionally confined pathology.

Stroke is the most common neurological disorder; symptoms of post-stroke depression are similar to those of primary depression. Overall prevalence of depression is around 30% in the first few weeks after stroke, and during the first 2 years after stroke 2/3s of patients are likely to experience symptoms of depression.

In Parkinson’s disease, the overall prevalence of depression is approximately 40%. Depressive symptoms are more common early in the disease (50%) and in those with an onset before the age of 55.

Conclusions:
In this presentation, I will submit my experience with stroke patients, patients with Parkinson’s disease and Conversion Disorders (Abnormal movements - Epilepsy - Paraplegias).

GLOBAL NETWORKS OF DEPRESSION CENTERS AND CANCER CENTERS: A NEW MODEL FOR TRANSFORMING CLINICAL CARE

INSTITUTIONS
1. University of Michigan, Depression Center, Ann Arbor, MI, United States

AUTHORS
1. John F Greden¹, Dr., MD, gredenj@med.umich.edu

Objectives
Depression and bipolar illnesses are leading causes of disability in the world. We propose to establish a Global Network of Depression Centers (GNDC) to address underlying causes.

Methods
The GNDC will be adapted from the successful Cancer and Cardiovascular Center Networks in America, will function as an independent alliance, distribute expert information, maintain a library of clinical practice guidelines, foster evidence-based care, coordinate clinical research trials, serve as a global “voice” on public health prevention and early detection, publish a GNDC Journal, work with professional societies, media, corporate and academic arenas, establish a biomedical and telemedicine informatics network for global information transfer. Initial steps: link academic institutions with community clinicians to generate large data samples needed for translational research breakthroughs; develop effective, low-cost screening for earlier detection; export evidence-based treatments to underserved populations; build alliances with primary care and high-risk medical specialties; develop genomic and pharmacogenetic biomarkers and new treatments.

Results
This presentation will describe the evolution of the National Network of Depression Center and address next steps for establishment of the Global Network of Depression Centers.

Conclusion
This proposal describes steps to establish a Global Network of Depression Centers to address the disabling and costly consequences of depression and bipolar in the world.

Objective - To stress the importance of a person-centered integrative approach in the training process.

References

This special symposium will draw our attention onto the importance of going back to the fundamental concepts that arose from the origins of western medicine, such as the principles of Greek philosophers and physicians, who recommended an integrative conception of medicine, focused on the person, with his/her own values, etc.

Once this position has been regained, it will become the leading path towards the education and training of specialists and their CME, so that this humanistic and ethical value perspective may reduce the risk of excessive dehumanizing medical practice, brought about by the revolutionary, necessary and unavoidable scientific-technological developments, which are surely positive if the previously mentioned person centred integrative approach is not neglected.

In this symposium, different local and global perspectives of psychiatric training will be presented and discussed.

PERSON - CENTRED EDUCATION IN PSYCHIATRY:
PERSPECTIVE FROM DEVELOPING COUNTRIES

INSTITUTIONS
1. King George Medical University, Dept. of Psychiatry, Lucknow, India

AUTHORS
1. Jitendra Trivedi1, Professor, M.R.C.P, jitendra.trivedi@gmail.com
2. Mohan Dhyani1, Dr, jitendra.trivedi@gmail.com

The concept of "Psychiatry for Person" envisages a vision for a holistic care for the patients with mental illness. Patients with mental illness should not be discriminated and stigmatized. The patients should not be treated just as cases of mental illness but as individuals with special needs. The appropriate training of physicians for catering to the philosophy of "Psychiatry for person" is required.

The building block for any mental health care is the medical graduate and for accomplishing the goal of psychiatry for the person appropriate training in the medical colleges is required. Most of the patients with mental illness seek help first from the general practitioner. It is important therefore to train the GPs and primary health care workers in psychiatry so that they are able to identify and treat common psychiatric disorders. The medical students should be trained so that they are not only able to identify and treat the common mental illness but also to empathize with patients having psychiatric illness.

Most South Asian countries do not have psychiatry as a separate subject in the curriculum and inclusion of psychiatry as a separate subject and compulsory posting in the psychiatry unit may be helpful.
LESSONS IN PERSON CENTERED CARE FROM AFRICAN TRADITIONAL PRACTICES

INSTITUTIONS
1. Kenya Psychiatric Association, Nairobi, Kenya

AUTHORS
1. Frank Njenga¹, Dr, fnjenga@africaonline.co.ke

Traditional practices among many African tribes, prescribed different and specific roles for the ancestors, grandparents, parents, children and other relatives including uncles and aunts, each of who had a role to play in the achievement of the wholeness of the human person. The healthy individual was one who enjoyed a balanced relationship with all those with whom he came into contact both vertically as in the case of the ancestors and horizontally as was the case with his siblings. In the event of problems in the life of the individual, mechanisms existed for the resolution of the challenges irrespective of their origins. Spiritual, sexual, economic, health and marital problems all had well known and established mechanisms of resolution. This paper will examine the lessons we could learn from African tradition in the promotion of person centered care for our patients. In particular, it examines the roles of these practices in the management of the major psychoses in particular Schizophrenia, post-natal depression, dementia as well as adjustment disorders as seen in adolescents.

PSYCHIATRIC TRAINING IN THE WORLD: CURRENT SITUATION AND FUTURE HOPES

INSTITUTIONS
1. Istanbul Bilgi University, Istanbul, Turkey
2. WPA Southern Europe Zone Representative, Istanbul, Turkey
3. UEMS-EACCME Evaluation Committee member, Istanbul, Turkey

AUTHORS
1. Levent Kueyl¹,²,³, Associate Professor, kueyl@superonline.com

There is a marked variability in the content and quality of psychiatric training across the world. Even before aiming to reach to a consensus on a set of minimum standards for psychiatric education, the review of the current data shows our limited evidence. The training programs, which theoretically should be constructed according to the desired competencies of a psychiatrist, need to consider the universal and unique challenges that psychiatry and the identity of the psychiatrist face. Based on the data provided by the Atlas Project of WHO-WPA on Psychiatric Education and Training Across the World (2005), this presentation will analyze the features of the current training programs in an effort to figure out some common trends. Discussion will further be focused on the identity and the roles of psychiatrist.
GENERAL AND SPECIFIC AIMS IN PSYCHIATRIC TRAINING

INSTITUTIONS
1. Facultad de Medicina, Universidad de Valencia, Psychiatry, Valencia, Spain

AUTHORS
1. Carmen Leal Cercos¹, Prof. Dr., carmen.leal@uv.es
2. Eduardo Aguilar Garcia Iturrospe¹, Dr., MD

Psychiatry training must include the acquisition of the following skills:
- Clinical abilities required for attending patients with mental diseases (prevention, diagnosis and therapeutic procedures which include rehabilitation programs).
- Adequate attitudes and behaviours for team work.
- Knowledge and skills that are required for organizing mental health services.
- Integration of ethical aspects in clinical practice.
- Promotion of healthy habits and detection of risk factors for the development of mental diseases.
- Cooperation with other clinical services (Liaison Psychiatry).
- Evaluation of clinical practice.
- Research activities.
- Training of other mental health professionals.

The achievement of these objectives is based on the development of three crucial aspects: knowledge (evidence-based psychiatry), clinical skills and attitudes. We will present our clinical rotation program which includes a comprehensive approach to our discipline.

IPPP: CLINICAL CARE CURRICULUM

INSTITUTIONS
1. University of Buenos Aires, Institute of Postgraduate Education in Psychiatry & CME - APSA, Buenos Aires, Argentina
2. Consultant to the WPA Committee on Education, Buenos Aires, Argentina

AUTHORS
1. Roger M. Montenegro¹,², Prof. Dr., rogermontenegro@wpanet.org

The Clinical Care Component of the IPPP has developed a clinical care curriculum - aimed at the training of psychiatrists and other mental health professionals, medical students and general health professionals - of competencies necessary for the implantation of a person centred approach to patients’ care. Emphasis is laid on how these competencies can be applied in routine clinical practice.

The curriculum contains a ‘gold standard’ for the person-centered approach, developed while taking into account good examples of human rights based practice from around the world.

The curriculum includes, among others, these key principles: the Patient must be approached as a whole person, in terms of his/her Personhood (e.g., exploring his/her life history, family environment, culture of reference, and personal values and goals); positive mental health and resilience must be taken into account; training should be both values-based and evidence-based; negative barriers must be removed in order to build strengths; families should be involved in the assessment and treatment processes; psychological and psychosomatic approaches are especially recommended; the rights of patients and ethical standards must be closely observed; interdisciplinary work is crucial; prevention must be fostered, according to the analysis of risk factors; consideration for the therapist as a person must be taken; effective communication among all those involved in the care of the patient must be encouraged.

This curriculum is expected to become a landmark towards the improvement of psychiatric care.
A COMMON LANGUAGE FOR THE DESCRIPTION OF SYMPTOMS OR DISORDERS OF FUNCTIONING IN MENTAL DISORDERS

INSTITUTIONS
1. Charité University Medicine Berlin and Rehab Center Seehof, Research Group Psychosomatic Rehabilitation, Teltow/Berlin, Germany
2. Mt. Sinai School of Med NY Univ, Div. Psychiat. Epidemiology, New York, United States

AUTHORS
1. Juan E. Mezzich, Prof., MD, juan.mezzich@mssm.de
2. Michael Linden, Prof. Dr., MD, michael.linden@charite.de

The scientific developments in the description and classification of mental disorders over the last 30 years have focussed on diagnostic algorithms. There has been almost no research on the definition and delineation of symptoms. The result is that there is a lack of validity to the diagnostic criteria if there is no discrimination e.g. between depressed, dysphoric, or fed up mood and all constitute a depressive episode. The symposium will discuss the need of reliable and valid criteria as basis for diagnostic algorithms and the many differences in the understanding of technical terms in the description of psychopathology.

CLINICAL DISCOURSE AND TERMINOLOGY IN PSYCHOPATHOLOGY: CULTURAL PERSPECTIVES

INSTITUTIONS
1. Istanbul Bilgi University, Istanbul, Turkey

AUTHORS
1. Levent Küey, Prof., kueyl@superonline.com

Culture is shaped and transmitted by language and language reciprocally re-builds the culture. This process also covers the discourse and terminology used for psychopathology. The current universal and basic terminology of psychiatry differentiates between different states of psychopathology while cultural realities and unique conceptualizations of terminology re-shape this discourse. Clinical practice in psychiatry takes place in the context of language. Language is a mean of expression and verbalization at one hand and reciprocally, a mean for re-constructing the clinical practice, i.e., psyche of the patient. Language shapes the clinical practice and is shaped by it. Furthermore, clinical practice begs the psychiatrist and the patient to work through in a joint effort where they need a common language. In many documents and statements of organizations of psychiatry, it is a common focus of scientific interest that the psychiatrists need to be culturally competent. This also means to be sensitive to the different meaning loadings of common universal terminology in different cultural settings. This presentation will open a discussion for a comparative review of the meaning loadings of common terminology in the field of mental health in different cultural settings, taking the terms "Health", "Mental health", "Mental illness", "Insanity", "Disorder", "Emotions", "Fear", "Anxiety", "Depression", and "Psychosis" as examples. It is believed that, such a discussion will help the clinicians to seek reliable answers to a basic question: "Do we mean what we say and say what we mean?"
THE AMDP-SYSTEM: A BASIS FOR GLOSSARIES OF TECHNICAL TERMS IN DSM, ICD, AND ICF?

INSTITUTIONS
1. University of Zurich, Dept. of Social and General Psychiatry, Zürich, Switzerland

AUTHORS
1. Paul Hoff1, Prof. Dr., MD PhD

AMDP (Arbeitsgemeinschaft fuer Methodik und Dokumentation in der Psychiatrie; Working group for methodical issues and documentation in psychiatry) was founded in 1965. Its central idea was to improve the description and documentation of psychopathological (and several somatic) findings as the necessary basis for valid and reliable diagnosis in clinical psychiatry as well as in research. The process started empirically with the data of more than 2500 patients, predominantly suffering from what was then called endogenous psychoses. The resulting system now consists of 140 items. It has been continuously evaluated and adapted during the last decades according to new empirical and conceptual evidence. In 2007, the 8th edition was published. AMDP is mainly used in German speaking countries, but a number of translations already exist (e.g. English, French, Italian, Japanese). AMDP provides a combination of a differentiated terminology that is clearly oriented at the classical descriptive psychopathology of, for example, Karl Jaspers and Kurt Schneider, with modern procedures of measurement and statistical calculation (e.g. syndromes), including a glossary of terms. Therefore it should qualify as a promising tool in developing a common glossary for the DSM/ICD/ICF-family of instruments.

A COMMON LANGUAGE FOR ALL, AND ALL SYSTEMS:
PROPOSAL FOR A NEW GLOSSARY OF TECHNICAL TERMS

INSTITUTIONS
1. Charité University Medicine Berlin and Rehab Center Seehof, Research Group Psychosomatic Medicine, Teltow/Berlin, Germany

AUTHORS
1. Michael Linden1, Prof. Dr.

Objectives: There are several glossaries of technical terms for signs and symptoms of mental disorders. There has been almost no research on their similarities and differences. This means that different diagnostic systems like DSM or ICD can not be compared because the definition, reliability and validity of the underlying criteria is unknown. A further problem is that traditional glossaries of psychopathological terms are bised towards psychotic illnesses, while the phenomenology of neurotic or reactive disorders is not represented.

Method: Descriptions and definitions of existing classification systems for mental disorders are compared and similarities and differentiations are described. The present definitions are heterogeneous, insufficient and lead to misunderstandings and misjudgements.

Results: A common glossary of technical terms for signs and symptoms of mental disorders is needed. Characteristics and an example for such a comprehensive glossary are discussed.

Conclusion: Science and professional bodies should work to improve the definitions and descriptions of signs and symptoms in ICD-11 and DSM-V.
ISSUES OF CONCERN IN THE REHABILITATION OF SEVERELY TRAUMATIZED

Chairperson: Marianne Kastrup (Denmark)

There is an increasing body of research related to the treatment and rehabilitation of severely traumatized persons including those who have been subjected to torture and organized violence. Knowledge about the mental health consequences of manmade disaster represents a major public health problem and is thus of clear clinical relevance for all psychiatrists worldwide. We know that a significant proportion of e.g. refugees and migrants seen in the Western countries have experiences of war, strife, persecution and torture and that a large proportion of the world’s population live in countries that condone torture. Management of the mental health consequences poses a major challenge to mental health services. The symposium will comprise latest findings in the rehabilitation of such populations and will further outline prevailing therapeutic models, preventive considerations as well as educational needs for the psychiatric profession.

OUTCOME STUDIES IN TREATED TORTURE SURVIVORS

INSTITUTIONS
1. IRCT, Denmark

AUTHORS
1. Jim Jaranson, Dr, Ph D, jaran001@umn.edu

Evaluating treatment outcome of torture survivors cared for by rehabilitation centers has made slow progress (1) despite the rapid expansion of such programs worldwide. Currently, the International Rehabilitation Council for Torture Victims (IRCT) has more than 134 members in its network, and it has been reported that as many as 235 treatment programs exist (2). Not only do funders require increasing documentation that services work, but centers also want to provide the best, most effective, and most efficient services. However, conflicting priorities, concerns about confidentiality, inadequate time and financial resources, lack of research expertise, and the complexity of the rehabilitation process hinder completion of outcome studies. The few completed outcome studies have severe limitations (2), and selected studies will be reviewed in this presentation. General principles for measuring outcome as well as clinical and design issues, including possible outcomes to evaluate, indicators, and instrument selection, will be presented.
ISSUES OF CONCERN IN THE MANAGEMENT OF POSTTRAUMATIC STRESS IN REFUGEES

INSTITUTIONS
1. Centre Transcultural Psychiatry, Denmark

AUTHORS
1. Marianne Kastrup, Dr, Ph.D, marianne.kastrup@rh.regionh.dk

Refugees seeking asylum have a high frequency of traumatic experiences. Such events include pre-flight experiences, such as persecution, internment or torture, as well as post-flight experiences, such as language barriers, discrimination, alienation, or social problems.

Clinicians confronted with persons of different ethnic background encounter a number of difficulties due to language barriers, different concepts of illness, and divergences in beliefs about that mental disorder, all of which have consequences for behavior and need for treatment. Furthermore, there may be barriers to treatment, as available mental health services may not fulfill the expectations of these patient populations.

In many Western countries we are presently experiencing restrictive changes in the legislation involving immigrants. Such alterations may relate to family reunions among refugees, social benefits in the host country, conditions for granting asylum, and length of permission to stay in the country.

These changes and the implied uncertainties for the refugee population may result in an exacerbation of an already fragile mental health situation.

These issues will be addressed from different perspectives, regionally as well as diagnostically.

THERAPEUTIC MODELS OF CORDELIA FOUNDATION - HUNGARY AND THE PREVENTION OF TORTURE

INSTITUTIONS
1. Cordelia, Budapest, Hungary

AUTHORS
1. Lilla Hardi, Dr, lilhardi@t-online.hu

The author presents the therapeutic work and the activity of CORDELIA Foundation for the Rehabilitation of Torture Victims.

The presentation focuses on the adaptation of „stable theoretical models” on multicultural groups of patients - survivors of torture - among changing external frames (refugee laws, political situation related to EU enlargement etc).

Individual psychotherapies are based on „insight therapies”. A cognitive therapeutic model, REBT (Rational Emotional Behavior Therapy - by Albert Ellis) is also used by the psychologist of the Foundation as well as „mother-child one-space therapy”. Family therapies are not only for families having a torture survivor father but for „mutilated” families, as well.

The therapeutic group work is always paralleled with the culture of the clients using several elements from the classical „communicative moving therapy” through the „station group therapy” to the „symbol group therapy”. New therapeutic group methods have been elaborated with patients suffering of uprooting and torture experiences: „Dynamic Drawing Examination” - it follows the progress of the patient in the therapeutic process with a serial of drawings - and „Somato-therapy” with its direct contact exercises.

„Group” and „Peer supervision” are used with the members of Cordelia Foundation and with the governmental staff in charge of the refugees - eligibility officers and nurses, social workers of the refugee shelters giving a „secondary” protection to our clients, as well.
THE FIGHT AGAINST IMPURITY TODAY

INSTITUTIONS
1. IRCT, Copenhagen, Denmark

AUTHORS
1. Inge Genefke¹, Dr. Dr. Medsc, ig@irct.org

Impunity, or freedom from prosecution for perpetrators of torture, remains commonplace worldwide. Most clinicians assert that impunity for torturers contributes to social and psychological problems, impeding the healing process for survivors (1).

From more than 30 years of research and experience in torture rehabilitation centers, we now have answers to What? Why? When? How? Where? And Who? What torture is, why torture is perpetrated, in what environments torture occurs, the purpose and methods of torture, the specific countries and places in which torture is perpetrated, and the characteristics of the perpetrators and survivors.

Even though the United Nations Convention against Torture provides the legal basis for never allowing torture under any circumstances, challenges have been made to the judgment of what constitutes severe pain or suffering, whether the aim of the act or its result constitutes torture, and whether “mild torture” can be allowed. The Istanbul Protocol has provided a method to investigate and document torture from the legal, medical, and psychological perspectives. A medical perspective using judicial and reconciliation/mediation provides additional tools in the fight against impunity.

Clinicians now have the tools to reliably define and document torture, providing information which can assist in the punishment of the perpetrators and prevention of torture.

Organized by the WPA Section on Preventive Psychiatry and Psychiatric Association of Eastern Europe and the Balkans

Prevention and mental health promotion are most important, but complex tasks. Despite the growing body of evidence-based preventive programs that have shown their efficacy, preventive psychiatry is still neglected and marginalized, especially in low-income countries. This symposium will deal with mental health promotion programs in few countries as well as with prevention of chronicification of mental disorders.
STRENGTHENING MENTAL HEALTH AS POWERFUL AGENT AGAINST CHRONIFICATION OF DISEASES

INSTITUTIONS
1. German Academy for Psychoanalysis, Germany

AUTHORS
1. Margit Schmolke

In recent years, professionals in the mental health promotion field claim that „there is no health without mental health“. Governments and health ministries realize more and more that the population’s health is an important cost factor and that mental health is fundamental to general health. Mental health promotion has a wide range of health and social benefits, such as improved physical health, increased emotional resilience, greater social inclusion and participation, and higher productivity, as stated by the UK Department of Health. The author will present some research results which show the clear interdependence of physical and mental health and how positive health factors (e.g., relationships, support, meaningfulness) may counteract against the chronification of physical and mental diseases.

5. S. Ozer

Mental health promotion is defined as any set of activities conducted for the purpose of fostering, protecting and improving mental health. These can range from community-level interventions, to individual-level interventions which cultivate skills and behaviors relevant to mental health. Mental health promotion initiatives should be implemented on networks of social support and create new ones that enhance the quality of mental health of individuals and community (1). Activities in alliance with different sectors in the society and media campaign for mental health promotion and lobbying for mental health with policy makers are other major methods to increase the effectiveness of related activities (2). Mental Health Platform-Turkey was founded in August 2006 with the initiative of the Turkish Neuropsychiatric Society and the Psychiatric Association of Turkey that issued an invitation to societies working on the area of mental health, including those of professionals (psychiatrists, psychologists and nurses), patients and caregivers, associations of physicians, public health societies. A declaration to the public was issued which emphasized the needs and priorities on mental health. The first media campaign occurred with a main theme on Mental Health Act and the implementation of community mental health services countrywide.

2. Vassilis Kontaxakis1,2,3

Mental Health Promotion should be an integral part of psychiatric work. Psychiatrists should not deprive themselves and their patients of their social role and should not limit their mission to just diagnosis and treatment of mental disorders. It must be realized that psychiatric prevention and mental health promotion are as important as diagnosis and treatment. It is gradually becoming clear that, since promotion of mental health has been shown to have beneficial effects on psychopathology and on the quality of life of the patient, omission or refusal to implement mental health promotion programs raises an issue of ethics. In fact the Hippocratic principle “ophelein” (beneficence) is violated by practices like the above. It should be pointed out that, if mental health promotion aims at the promotion of the status and mental health of the psychiatrist rather than that of the patient or if it is carried out by irresponsible persons, it runs the risk of violating another Hippocratic principle, the “mi vlaptein” (non nocere) principle. It is therefore important to entrust responsible professional services or organizations with this important task. A paradigm of a successful mental health promotion activity is the Athens Mental Health Promotion Program that was for the first time implemented at Athens University Department of Psychiatry with the collaboration of the Hellenic Psychiatric Association and other organizations in 2003-2004. This program involved collaboration with educators, judges, clergymen, army and police officers, journalists, general practitioners and other important community representatives and was enthusiastically received by all parties.

ANTISTIGMA PROGRAM IN SCHOOLS - IMPORTANT TOOL FOR MENTAL HEALTH PROMOTION

INSTITUTIONS
1. Institute of Mental Health, Serbia and Montenegro
2. School of Medicine, University of Belgrade, Serbia and Montenegro

AUTHORS
1. Dusica Lecic Tosevski1,2
2. Milica Pejovic Milovanovic1,2
3. Smiljka Popovic Deusic1,2
4. Saveta Draganic Gajic1,2

Mental illnesses generate misunderstanding, prejudice, confusion, and fear. Adolescents frequently report that stigma of mental illness can at times be worse then the illness itself. Unmet mental health need is a significant problem for adolescents and stigma of mental illness is one of the reasons for it, as well as a major barrier to the use of mental health services. We conducted an antistigma program among high school students with the objectives to reduce discrimination against peers with mental health problems. The program included 60 high school students. All participants filled in the Opinion about Mental Illness (OMI) scale at the beginning and at the end of the program. The program lasted for seven consecutive weeks and included lectures which covered relevant topics in mental health, workshops on personal attitudes towards mental illness, group activities and discussion. Results have shown improvement in understanding the problems of mental health as well as students’ attitudes towards them which is helpful in reducing stigma that prevents young people to seek help. It also contributes to better understanding of those with mental illness, as well as to their social integration and mental health promotion.

References:
One of the WPA work plans between 2005 and 2008 is improvement of mental health care towards a person-centered psychiatry. This will include the improvement of mental health care system in the world, particularly in developing countries. It aims at ensuring that WPA fulfills its mission of advancing psychiatry and mental health across the world by engaging all governmental and non-governmental mental health stakeholders (patients, families, health professionals, public health policy makers, industry, journalists), through a variety of interactive means, to be responsive to mental health problems (e.g., illnesses, disasters and violence), to attend to disparities within and across countries, and to contribute to mental health promotion worldwide. This includes a movement towards a psychiatry for the person promotes a contextualized and integrative perspective, seeking to articulate science and humanism in the service of the wholeness of the person who consults, within the community, consistent with what is the fundamental soul of medicine and psychiatry. In line with this, integration of mental health, general health and social services should be promoted. This holistic and Hippocratic perspective also serves as foundation for the promotion of ethics in psychiatry. The program includes the conduction of the WPA Institutional Program on “Psychiatry for the Person: From Clinical Practice to Public Health”, therefore, including this symposium on “Improvement of mental health care towards a person-centered psychiatry in XIV World Congress of Psychiatry, Prague 2008.”

The integration of community based and hospital based mental health care system has assumed increasing important role. This symposium will present a electro diagnostic instrument to help the integration of community based and hospital based mental health care system and introduce two major regional programs, the Qindao, and NingBo Model of hospital based mental health care combined with community based mental health care in China. It could be established within the constraints of the limited economic resources available.
RELIABILITY AND VALIDITY OF RTHD RATING PATIENTS WITH ORGANIC MENTAL

INSTITUTIONS
1. Shandong Mental Health Center, Jinan, China

AUTHORS
1. Zhong Chen, Chenzhong680511@163.com

Background:
We compile Rating Test for Health and Diseases (RTHD) in order to meet the current needs of both hospital and community based mental health care systems. RTHD serves as a diagnostic instrument for psychiatric and medical examination of the mentally ill patients. The diagnosis of RTHD is based on ICD-10, and DSM-IV, as well as CCMD-3.

Objective:
To test the Reliability and Validity of RTHD rating patients with organic mental disorders.

Methods:
Using RTHD-LVS (RTHD-Logical Verdict System) makes diagnoses of 60 patients with organic mental disorders, and compares the diagnoses not only made by two Chinese psychiatrists according to DSM-IV, but also made by psychiatrists in Chief at the ward the patients lived in. Then the two psychiatrists rate all the patients again in 6 month after their discharged from the hospital. The results will be published in details on this occasion.

PROVIDING THE HIGH QUALITY MENTAL HEALTH CARE TO REALIZE HARMONY OLYMPIC GAME

1. Pang Shu Tao, frcps@public.qd.sd.cn

Qindao city is on the eastern coast of the Shandong peninsula in China. It administers 6 districts with a total population of 8 million. In2006, a three tier (city, district, street) rehabilitation network based on home beds was re-established. The network was incorporated into the overall plan for community health services. Particularly, based on the network of treatment and rehabilitation for mentally ill patients in the city, a evaluation of psychological education for 800 schizophrenic patients with low doses antipsychotic drug maintenance in the community mental health service system has been conducted. It provided the considerable social benefits for patients with mentally disorders and the society which holds the Olympic Sailing Game.
THE THREE TIER NETWORK OF MENTAL HEALTH CARE SYSTEM FOLLOWING THE SURVEY OF MENTAL DISORDERS IN NINGBO

INSTITUTIONS
1. Ningbo mental health center, Ningbo, China

AUTHORS
1. Hu Zhenyu1, Hzhy-1960@tom.com

Ningbo city is on the eastern coast of the Zhejing Province in China. It administers 8 districts with a total population of 7 million. In 2007, a three tier (city, district, street) rehabilitation network based on home beds was established following the survey of mental disorders in the city. The network was incorporated into the overall plan for community health services so that it could be established within the constraints of the limited economic resources available. This network of care has provided considerable social benefits not only for mentally ill patients but also for society. The aim of the study is mainly at the feasibility of low dose of antipsychotic drug maintenance combined with psychological education in the community mental health service system in China.

Objectives: to review the origin and scope of WHO QOL as global standard measurement of QOL and seek common qualities and good mental health beyond the differences in culture, religion and race.

Method: to invite four internationally known researchers to express their view on quality of life and good mental health which encompass different cultures, religions and races.

Expected result: to find ways and means to reduce conflicts resulting from differences in culture, religion and race and to promote better quality of life and positive mental health of the global population.
QUALITY OF LIFE AND MENTAL HEALTH: A GLOBAL VIEW

INSTITUTIONS
1. University of Geneva, Department of Psychiatry, Geneve, Switzerland

AUTHORS
1. Norman Sartorius, Dr, MD, PhD, normansartorius.com

The introduction of Quality of life (QOL) as an indicator of effects of health care in the 1980’s has been a confirmation of the (belated) realization that it is important to pay attention to psychosocial aspects of health and health care. The acceptance of the need to measure quality of life did not result in an agreement about the method to do so: while some considered that quality of life can be assessed by noting what a person has and can do others promoted the idea that it is important how persons feel about themselves and their position. The World Health Organization (WHO) resolved that it would be best to measure both and its instrument (WHOQOL) allows the assessment of health conditions and people’s satisfaction with their functioning.

QUALITY OF LIFE AND MENTAL HEALTH: ISLAMIC PERSPECTIVES

INSTITUTIONS

AUTHORS
1. Muhammad Afzal Javed, Dr, MD, afzal.javed@ntwworld.com

Despite the secularising influence of modern society, the presence of religiosity remains substantial and reports suggest the positive impact of religious beliefs and practices on our day-to-day functioning. Religion and spirituality are emerging important topics in the field of mental health as well & recent psychiatric literature suggests well documented evidence that the religious dimensions are amongst the most important factors that structure human values, psychological experiences, behaviours and illness patterns. This paper will discuss the role of Islam in this regard and will review different practices improving quality of life and the process of psychological healing within the Islamic perspective. Different conceptual issues about this topic will also be discussed addressing the needs to review the role of religion in mental health with reference to future research directions. It will be argued that there is a great need to acknowledge the role of religion and spirituality in improving quality of life and understanding mental health problems. Similarly religion and psychiatry will have to say a lot to each other and need to continue the dialogue to understand each other’s weaknesses and strengths for the betterment of the individuals who are suffering from mental health difficulties.

Key Words: Religion, Islam, Quality of life, Mental Health.

QUALITY OF LIFE AND MENTAL HEALTH IN A MULTI-ETHNIC COMMUNITY

INSTITUTIONS
1. National University of Singapore, Department of Psychological Medicine, Singapore, Singapore

AUTHORS
1. Heok Kua1, Dr, MD, PhD, pcmkeh@nus.sg

Ethnicity, mental health and quality of life (QOL) are multi-faceted concepts. Perception of QOL is influenced by mental health and varies not only with ethnicity but also gender, age groups and social class. Singapore as a cosmopolitan city with a myriad of cultures and religions is a propitious setting to study the interactive impact of these factors on QOL and mental health. This paper will discuss 2 research projects on QOL and mental health in Singapore.

The first study was a community sample comparing patients with schizophrenia and general practice outpatients using the Dartmouth COOP - World Organisation of Family Doctors Functional Health Assessment or COOP/WONCA. Stepwise linear regression analysis showed that poorer QOL in schizophrenia patients was predicted by dissatisfaction with family relationship and emotional well-being (Tan HY et al, 2004).

The second project is a longitudinal study of a cohort of elderly people (65 years and more) living in the community and the SF12 is used to compare QOL in 3 ethnic groups, namely Chinese, Indians and Malays. Among the elderly it appears that there is commonality of factors associated with QOL and mental health (Ng TP et al 2007).

Key Words: Ethnicity, Quality of life, Mental Health.

AUTHORS
1. Naotaka Shinfuku1, Dr, MD, PhD, shinfuku@seinan-gu.ac.jp

Globalization has both positive and negative impact on quality of life. Globalization has contributed to increasing living standard of many Asians thus resulting in longer life span and convenient lifestyle. However, globalization of economy has made working places competitive and money oriented. Globalization has eroded the basic social fabric of communal oriented Asian society supported by warm human network. Our study showed the quality of life measured by WHO QOL Scale had reverse relationship with the income level in multi-ethnic society ***. It is hard to define QOL in public health. However, the rate of depression and suicide in the community will be a possible marker for the QOL. My presentation will cover, among others, the following aspects.

- Overview of factors related to QOL in Asia
- Globalization in East Asia in 1990’s
- New mental health problems after 1990’ in East Asia
- Increase of depression and suicide in Japan in 1990’s
- Analysis of Suicide Prevention Law enacted in Japan
- Asian cultural heritages to promote QOL

NEW CHALLENGES IN THE NORTHERN EUROPEAN REGION

INSTITUTIONS
1. Centre Transcultural Psychiatry, Copenhagen, Denmark

AUTHORS
1. Marianne Kastrup, marianne.kastrup@rh.regionh.dk

In all WPA European Zones we support and feel concerned raising public awareness about mental health problems and fighting stigma and discrimination due to mental illness. Repeatedly, values as equality, and fairness have been mentioned as values the Northern European region adheres to. The Northern European zone however faces new challenges related to the migrant population and there is a need to develop strategies to empower marginalized, vulnerable groups and work for their reintegration into society. In e.g. Denmark, persons of a non-Danish background comprise about 8-10% of patients in psychiatric care. This proportion varies greatly, as community mental health services in certain city districts have about 25% immigrant patients, and in forensic services the proportion may amount to 40%. No explicit health policy has been formulated with respect to immigrants. They have access to the same health services as the rest of the population once granted a residency permit implying that psychiatrists are likely to meet patients from other ethnic background in daily clinical practice. With increased globalization there is however a need to pay more attention to cultural aspects at all levels and develop strategies to increase the cultural competence of mental health professionals both at undergraduate and postgraduate level. The paper will discuss the content of a culture sensitive curriculum and strategies to implement it.
WILL THE NEW FRENCH MENTAL HEALTH PLAN BRIDGE THE GAP BETWEEN TRADITION AND GLOBALIZATION?

INSTITUTIONS
1. French Justice Ministry for the Juvenile Judicial System, France

AUTHORS
1. Michel Botbol, michel.botbol@wanadoo.fr

French Psychiatry is currently facing crucial changes calling into question much of what was considered its most specific characteristics and traditions. These changes induce a radical splitting between 1) what is still the common profile of most French psychiatrists still referred to this specific tradition, 2) the new model imposed by stakeholder and policy maker who want French psychiatry to merge a more global profile referred to Anglo-Saxon classic evidence-based literature on epidemiology, treatments, public health organisation, and education. This paper will draw the current profile of French psychiatry (on manpower issues, education issues, legal and scientific issues), and present the recent steps taken by the new mental health program to deal with this splitting.

INDICATION OF PERSON CENTERED APPROACHES IN HELSINKI DECLARATION’S ACTION PLAN

INSTITUTIONS
1. Armenian Association of Psychiatrists, Armenia

AUTHORS
1. Armen Soghoyan

Helsinki Declaration emphasized on the action plan in 12 priority areas, each one of which directly or indirectly linked to the concept of Psychiatry for the Person. For the promotion of the Mental well-being one of the key elements is an individual which from another hand is a main focus of Person-centered approach. There is no concept of human rights and dignity which could overcome the issue of personality even more destigmatisation is impossible without person, as a community unit. Targeted support reflects on individual intervention plan /mainly treatment/ for every single patient which will be possible to realize with considering personal attributes. Fundamental approaches are respectful attitude towards the personal preferences, multidisciplinary workforce and consideration of national and international differences in assessment of Mental Health status. Last three areas are mainly based on humanistic viewpoint which was created by well known “Client-centered” approach, basic value of which is again the Person. Are all the governing bodies, who signed the declarations, putting enough efforts to implement the ideas of declaration? Experience indicates that especially in Eastern European countries from ratification to implementation there is a long way to go.
PARTNERSHIP FOR MENTAL HEALTH - INSTRUMENT FOR CONFlict RESOLUTION AND RECONCILIATION

AUTHORS
1. Dusica Lecic Tosevski, dusica.lecictosevski@eunet.yu

The Central Europe region represents a mosaic of developed and developing regions, modern and traditional parts with similarities and differences in the development of psychiatry which depends on many factors involving economic development, professional resource availability, national priorities, history of conflict and the particular culture. Most of the countries are post-communist and there is a rapid social, economic and political change in them since the late 1980s, at a pace that is unparalleled in history. Due to prolonged stress in some countries, the health system has deteriorated and the reform of mental health care is a difficult task. There are many problems which are a challenge for the role of psychiatrists. The reform of mental health care is under way with an accent on community care, prevention of mental disorders, mental health promotion, antistigma campaigns and continuous education. The joint program for mental health care reform which is involving many countries in the region is a good instrument for conflict resolution and reconciliation.

APPLICATION OF MENTAL HEALTH POLICIES IN WPA’S ZONE 3: LIMITATIONS AND SCOPE

INSTITUTIONS
1. Hospital de Psiquiatria Hector Tovar Acosta, IMSS, Clinical Services, Mexico City, Mexico

AUTHORS
1. Enrique Camarena, Mr., MD, drfercorgo@gmail.com

OBJECTIVE: To describe polices application in WPA’s zone 3
METHODS: The WPAs Zone 3 is a heterogeneous zone due to its sundry development levels, its social/cultural profile and its economical status. Differences could be abysmal if we talk about existence of resources, number of mental health professionals, places for education and development of the professionals in this area, territorial extension, etc. Just a few years ago we started to develop some interchange programs and its human resources as well as its infrastructure, are practically null. There are amazing contrasts within the country as we find deeply poor and marginal zones which do not have access to the resources previously described. Only recently we have started to held interchange programs within our country where we have "polished" the academic programs, as we do not hold, for all cases, the necessary and qualified staff of professors so we can offer respectable and worthy courses. laces for the psychiatric field, which is the U.S.A. We are still lacking trustful statistical methods in the zone which could give us a clearer idea of the dominant pathology and its regional variations.

POLICY APPLICATION OF PSYCHIATRIC CARE IN A PSYCHIATRIC HOSPITAL IN MEXICO CITY

INSTITUTIONS
1. Hosp. Psiquiatrico Fray Bernardino Alvarez, Clinical Services, Mexico City, Mexico

AUTHORS
1. Fernando Corona¹, Mr., MD, drfercorgo@gmail.com

OBJECTIVES: To present the way in which mental health policies are working in a high populated, urban, public, psychiatric hospital in Mexico City.

METHODS: Description of activities: Fray Bernardino Alvarez Psychiatric Hospital is a 300 beds hospital, is 41 years old and depends upon the Ministry Of Health. It has three central priorities in its duties. First, provide clinical services to open population, second, formation of clinical personnel in the area of mental health, and third, to generate investigation protocols.

RESULTS: In the way to do its first aim there are two main clinical areas, the first one is hospitalization and the second is ambulatory services, including day and weekend partial hospitals and emergency room. In hospitalization service we have 85% occupation rate along a year and 3574 discharges in the same period, a 13.2% rotation index for bed, and an average stay of 30 days. The ambulatory service provides 30,000 scheduled consultations and 18,500 emergency room consultations. For the second objective we have a Medical Formation Service that controls a total of 100 medical residents in Clinical Psychiatry and many groups of undergraduate and postgraduate nurses, psychologists and social workers linked with clinical programs of mental health. Finally we have an Investigation service yielding 25 clinical and epidemiological protocols per year.

1. Hospital de Psiquiatria Hector Tovar Acosta,IMSS, Medical Director, Mexico City, Mexico

AUTHORS
1. Leopoldo Zarate¹, Mr., MD, drfercorgogmail.com

OBJECTIVES: To describe the form in which mental health is provided in Social Security System in Mexico.

METHODS: Since approximately 50 years ago, a Social Security System for all employees earning a salary, was created in Mexico. Its registered expansion during the first 35 years was enormous. Practically, since 1990 up to our present days, the number of positions for psychiatrists and other professionals of mental health has been null (less than .05 %) and it is logical to assume that we are way below the recommended indicators of OMS which call for one psychiatrist per 20,000 inhabitants and a psychologist for each 40,000. These facts have made necessary to develop several alternate strategies such as the specific psychiatric training addressed to the large body of family doctors that the institution has, where we do not always find the expected results.

Objectives:
To improve opportunities and strategies for educational programs for mental health professionals.
To promote effective working of psychiatrists within multidisciplinary teams and with other medical specialties around the world.
To propose curricular programs more adjusted to people and region’s needs.

Child and adolescent psychiatry in Latin American countries has become in a novel discipline considering its early appearance in the contemporary world and even more in developing countries, what it cause some difficulties in it practice, among others, by the medical psychiatric non-culture which is compared with pediatric culture resulting on many doubts and reserves regarding to the understanding of infantile psychiatry as a medical discipline.

The inherent difficulties to the stigmatization of the discipline, patients and psychiatrists make difficult it approach, it diagnosis and the treatment of those problems what the child and adolescent population have to deal with; without avoiding those not easy issues related to the social, cultural and ethnic context of the Latin American reality and vicissitudes.

Taking into account the issues above mentioned it will be presented a brief review of some Latin training programs for mental health professionals, which is its curricular program, structure, guideline, requirements and their impact, all of it as a result of a field research applied to six Latin-American countries.
THE MOST RELEVANT DIAGNOSIS IN LATIN AMERICA

INSTITUTIONS
1. Latin America Psychiatric Association, Ecuador

AUTHORS
1. Emma Saad¹, Dr., MD

Conceptual theoretical work in which the main pathologies of the population infant youth in Latin America are analyzed. All the factors that can influence in the appearance of these pathologies are determined, taking as it bases the Ecologic Model. We will occur special emphasis to the psychopathologic effects of the intrafamiliar violence, the migratory movements and the mass media on the Mental Health of the children and adolescents.

Objectives
1. To determine more frequent the pathologies than appear in the adolescent population that consults the services of Mental Health in Guayaquil
2. To analyze biological, psychological, familiar and social stress factors including in the ecosystem of this population
3. To determine the more effective intervention and prevention strategies in the different pathologies

Material and Methodology
Clinical Histories from the adolescents who consulted the Service of Mental Health in the Psychiatric Hospital in the period between the 01.11.07 to the 31.01.08. Uni- and multivariated statistical analysis using program SPSS 10.0

Results
1. The most frequent pathologies in the studied adolescents were the affective disorders, the behavior problems and the Psychosis
2. The stress factors of greater incidence in this population were: familiar history of mental disorders, intrafamiliar violence and emigration of one or both parents.
3. The ecologic approaching strategies to deal with this problem was effective in the short term in these adolescents.

Conclusions
All the elements of the eco-systemic context in the youthful population of Latin America can influence in the appearance of the psychiatric syndromes, which implies in addition multidisciplinary strategies to therapeutic boarding.

UNITY AND DIVERSITY: ADAPTING INTERNATIONAL CLASSIFICATIONS TO LOCAL REALITIES AND NEEDS

INSTITUTIONS
1. Havana University, Havana, Cuba

AUTHORS
1. Ángel A. Otero

There are two kinds of phenomena relevant to psychiatric diagnosis and nosology: Those of universal nature that take place anywhere (although, their forms of expression, intensity, and other non essential characteristics may vary in different settings), and those of local nature, which only take place in certain environments. A dialectical relationship exists between both types of phenomena, such that one can not be understood without taking into account the other. A single diagnostic and statistical manual (based only in the clinical practice and research of highly developed countries, can not be considered either universal or the most appropriate tool for any local reality around the world and. the mere substitution of ICD by a group of regional or national classifications would be even worse. Since the harmonization of local and general factors is mandatory for an effective two-way communication across different realities, and regional adaptations of ICD to the local characteristics of people seems to be the best way to do it. Regional glossaries of psychiatry should not be conceived as a mere listing of local adjustments to the international classification, or the addition of the so-called “culture-bound syndromes” and local forms of expressing distress. They must also be the basis for a Comprehensive bottom up construction of ICD. The way in which this task has being assumed by several nations is discuss in this symposium.

GENERAL ISSUES AND CHALLENGES ON ADAPTATION TO INTERNATIONAL DIAGNOSTIC SYSTEMS

INSTITUTIONS
1. Instituto Nacional de Salud Mental Peru, Specialized Research and Teaching Bureau, Lima, Peru
2. Universidad Peruana Cayetano Heredia, Departamento de Psiquiatria y Salud Mental, Lima, Peru

AUTHORS
1. Javier Saavedra

In 1959 Stengel put in evidence the lack of international agreement between psychiatrists with respect to diagnostic criteria of mental disorders. Several initiatives suggesting possible solutions appeared, such as more comprehensive diagnosis, the use of specific diagnostic criteria and the inclusion of these in international classification systems. Ongoing criticism regarding these systems included being politically and socioeconomically influenced, being restricted to local realities and reductionist, to sacrifice validity for reliability, to forgo local entities, to be over-inclusive. New nosological streams are aimed at harmonizing unity with diversity through local adaptations of international classifications. Some authors argue this to be a step backward, alleging the risk of political and sociocultural meddling. Nevertheless, this new proposal is based on the following: a) symptoms and disease experience are highly dependent on narratives of social context; b) the necessity to preserve, protect and develop research on local entities; c) the opinion of professional users about the requirements of these systems; d) the possibility of integrating local innovative proposals into other regions or into the general nosology; e) the complexities of the psychopathological phenomena framed on changing values, norms and attitudes; f) the destigmatization of concepts that have local derogatory connotations; and g) the existence of multiple actors related to the classification systems with differentiated roles on each region or country. The challenges of these adaptations are to keep full compatibility with current international systems, reduce the possibilities of sociopolitical interference, and the inclusion of local values that consider the users’ point of view.
THE LATIN AMERICAN ADAPTATIONS OF ICD HISTORICAL DEVELOPMENT, CURRENT STATE AND PERSPECTIVES

INSTITUTIONS
1. Havana University, Havana, Cuba

AUTHORS
1. Ángel A. Otero

The Latin American Guide of Psychiatric Diagnosis (GLADP) is the logic consequence of the contributions of many outstanding professionals of this region, and of Cuban Glossaries of Psychiatry. It was conceived from the very beginning not as a simple diagnostic manual, but as a much more ambitious project bringing together the efforts of Latin American mental health professionals in an enterprise having as a more general objective to protect and reinforce the cultural and scientific treasure of our peoples and humanity, under the premise that "wealth is not abundance; wealth is diversity". Since its beginning in late 1990s, a wide work in implementation, dissemination and research, have been developed. In this paper, the author will review GLADP historical development as well as current and future state of the project with special emphasis in its relationship with WPA and OMS.

CHINESE CLASSIFICATION OF MENTAL DISORDERS AND RELATION TO CLINICAL CARE

INSTITUTIONS
1. Beijing Huilongguang Hospital, Beijing, China

AUTHORS
1. Yanfang Chen

The CCMD-3 published in 2001 is based on several National multi-center field trials and it was developed based with the aim of improving services to patients while meeting the need of the Chinese society. While compatible with the ICD-10, based on the field trials, particular additions (e.g., hysterical psychosis, mental disorders related to culture, traveling psychosis, etc) or omissions (e.g., mixed anxiety and depressive disorder, acute polymorphic psychotic disorder without symptoms of schizophrenia, etc.) were adopted for the CCMD-3. Furthermore, based on extensive empirical work including 4341 ratings of 1538 patients with 17 different mental disorders, a diagnostic instrument called Rating Test for Health and Diseases "RTHD" was developed. The RTHD provides a CCMD-3 multi-axial diagnosis. It can also provide diagnoses based on ICD-10, and DSM-IV. The RTHD employs a clinical language that is familiar to clinicians from different theoretical backgrounds and, thus, is suitable for clinical work, research projects, and epidemiological studies. RTHD contains a glossary of differential diagnoses and a computerized logical decision tree that provides diagnoses on seven axes (RTHD-Logical Verdict System; LVS). Results from a trial using the RTHD in the three tier network of community based mental health care system in Ningbo City China will be discussed.
FRENCH CLASSIFICATION FOR CHILD AND ADOLESCENTS PSYCHIATRIC DISORDERS

INSTITUTIONS
1. Advisor of the French Juvenile Justice Systems Direction, Paris, France

AUTHORS
1. Michel Botbol

Operational since 1983, the French Classification of Child and Adolescent Mental Disorders (CFTMEA) is the classification of reference for all French Child psychiatrists who are very attached to it because they find there the clinical and therapeutic way in which they recognize themselves and in which they were (and continue to be) trained. Validated through multicentric studies, it currently remains used in the whole of the medico-administrative documents in circulation in France and takes part in the existing evaluations aiming at knowing the activity of the public services of Child Psychiatry and to plan their evolution. The CFTMEA is glossarised; it is articulated with the classification of the handicaps such as it was elaborate starting from the Woods principles, and comprises a table of conversion with the ICD10. A data-processing expert system was built on this classification, testifying to the rigour and the reproducibility of its step. The CFTMEA is deliberately built according to a hierarchical architecture built on two quite distinct axes. It thus favours an overall catching of the disorders which it classifies, seeking in priority to establish a structural diagnosis; this structural diagnosis includes personality characteristics and is referred to psychodynamic psychopathology. CFTMEA is thus not pretending to be atheoretical; on the contrary it clearly affirms the theory on which it is based, allowing it to remain closer to the clinical steps which are never atheoretical when they do not limit themselves to simple symptomatic descriptions.

CONCEPTUAL ISSUES ON PSYCHIATRY FOR THE PERSON

INSTITUTIONS
1. Hellenic Centre for Mental Health and Research, Greece
2. Standing Committee on Ethics, WPA, Switzerland
3. Psychiatric Association for Eastern Europe and the Balkans, Athens, Greece

AUTHORS
1. George Christodoulou

"Psychiatry for the Person” is a WPA Presidential Institutional Program that aims at re-focusing the attention of the psychiatric community to the importance of the Person as an ally, as a contributor and partner to treatment and as an independent, equal participant in decisions concerning individual but also social provision of mental health care.

Conceptually, Psychiatry for the Person is based on philosophical principles dating back to Ancient Greek philosophy and medicine as well as to oriental wisdom and teaching. It incorporates medical ethics, positive mental health, holistic medicine, professes integration of mental health services in general health facilities, underlines the importance of prevention and mental health promotion and highlights the importance not only of the patient (user of services) as a person but also of the psychiatrist (provider of services).

The aim of this Symposium is to emphasize the Historical perspective, the Ethics perspective, the Biological perspective, the Psychological perspective and the Psychiatrist's perspective in connection with Psychiatry for the Person.
PSYCHIATRY FOR THE PERSON: HISTORICAL PERSPECTIVE

INSTITUTIONS
1. University of Zurich, Department of General and Social Psychiatry, Zurich, Switzerland

AUTHORS
1. Paul Hoff, paul.hoff@puk.zh.ch

The relationship between the notions of disease (afflicting a person) and of the person (being afflicted by the disease) has always and for all psychiatric concepts been a major issue. This paper demonstrates by historical and recent examples that any model of mental disorder - be it biogenetic, psychogenetic or sociogenetic in nature - carries a risk to underestimate or even ignore the fields of subjectivity and personal autonomy. This underestimation may happen by declaring personal autonomy as a philosophical hypothesis outside the scientific area or by its reductionistic “explaining”, e.g. in terms of neurobiological dysfunction. To understand personal autonomy as the basic framework of both practical psychiatry and empirical research, will not only have a positive impact on the patients, but also on the future development (not to say survival) of psychiatry as a medical and scientific discipline.

PSYCHIATRY FOR THE PERSON: ETHICS PERSPECTIVE

INSTITUTIONS
1. Hellenic Centre for Mental Health and Research, Greece
2. Athens University Department of Psychiatry, Athens, Greece
3. Standing Committee on Ethics, WPA, Switzerland
4. Psychiatric Association for Eastern Europe and the Balkans, Athens, Greece
5. Edgware Community Hospital, London, United Kingdom

AUTHORS
1. George Christodoulou, gchristodoulou@ath.forthnet.gr
2. Vassilis Kontaxakis
3. Nikolas Christodoulou

The essence of “Psychiatry for the Person” (re-focusing the attention of the psychiatrist to the patient as a person as distinct from the patient as a recipient of services) clearly signifies the ethical character of this approach.

The purpose of this presentation is to examine one by one the existing theories of ethics in Medicine and Psychiatry (virtue ethics, casuistry, deontological theory, utilitarianism, principilism and ethics of care) and to note to what extent the principles of Psychiatry for the Person are consistent with these theories. Psychiatry by the person (referring to the role of the psychiatrist as a person) will also be examined in this context.

The conclusion is that Ethical issues are very important determinants of the relevant WPA Presidential Program and justify the re-emergence of our attention to the patient and the physician as persons.

BIOLOGY OF PSYCHIATRY FOR THE PERSON

INSTITUTIONS
1. Washington University, Psychiatry, St. Louis, United States

AUTHORS
1. Robert Cloninger, clon@tci.wustl.edu

The biology of human beings as a person is considered from a developmental and evolutionary perspective. The goal is to consider the basic conceptual issues about the biology of psychiatry of the person. Contemporary biological psychiatry is based on a highly reductionistic model in which the mind is reduced to brain processes that are determined by gene-environment interactions coded by molecular processes. However, consciousness remains an unsolved mystery. In fact, psychobiological evolution has a clear direction toward increasing information processing capacity and self-aware consciousness. Human beings have three major systems of learning and memory, including procedural learning (habits and skills), semantic learning (facts and propositions), and episodic learning (intuitions and life narratives that are self-aware). The properties of each of these aspects of learning are reviewed, learning to a more adequate set of basic biological assumptions of a psychiatry for the person. Specifically, (1) Self-aware consciousness cannot be reduced to material mechanisms. (2) Each person has three distinct aspects - body, thoughts, and psyche - each with rich, irreducible, innate properties. (3) Personality is the self with its rich innate endowments operating in a psychosocial context in which s/he is pulled between internal forces (e.g., aspirations for awareness, love, and coherence, and memories, fears, drives) and external forces (e.g., powerful situations, culture, and conditioning). (4) Evolution and development has a direction in time toward increasing self-aware consciousness, just as language acquisition involves the modular activation of insight and understanding from its rich innate endowment, not an algorithmic response to external stimulation. Otherwise people would be incapable of self-awareness and inter-subjective understanding in relationships. The human person has evolved beyond the consciousness of the sea slug to become more self-aware, altruistic, and sublimating like Mahatma Gandhi.

PSYCHIATRY FOR THE PERSON: PSYCHOLOGICAL PERSPECTIVE

INSTITUTIONS
1. University of Belgrade, Institute of Mental Health, School of Medicine, Belgrade, Serbia and Montenegro

AUTHORS
1. Dusica Lecic-Tosevski, dusica.lecicosevski@eunet.yu

The importance of psychological mechanisms operating in health and disease is well-known to experienced clinicians and the miraculous way in which the most effective drug in the world (the placebo), works is equally well-known. Psychological factors are, therefore, very important determinants of health and disease although, in view of the fact that they are translated in the body into biological mechanisms, they should perhaps not be referred to as such.

Personified Psychiatry is conceptually linked to respect for the personality, the autonomy and the integrity of our companions in life, healthy or not healthy. The psychological effect of this approach has serious implications not only for health and disease but also for the well-being and the quality of life of a person.
Conceptual issues on Psychiatry for the Person need also to take into consideration the Psychiatrist as a person, i.e. the role of the psychiatrist and his/her attitudes towards mental illness and persons affected by mental illnesses. The basic variables to be considered here are empathy, self-congruence, positive appraisal and a generally client-centered approach. Also, several issues of the „person”-perspective need to be discussed: There is the first person of the patient experiencing a mental disorder; then there is the second person, i.e. the psychiatrist observing and analysing the patient, and there is the third person, i.e. the distant view onto oneself. A common theme here, viewed from a more general biopsychosocial background, is that the „person” represents the level of experiences and actions. Also, the question how the psychiatrist integrates this approach into the diagnostic process, therapy, care, research and education arises. Psychiatry by the person may require specialist medical knowledge and an excellent command of communication techniques. Furthermore, the psychiatrist needs to engage with the patient’s concept of mental disorders, which includes cultural and other social factors. But where are the limits, when, e.g., issues of coercive treatment arise, or when empathy and spirituality are „overdone”? How may such questions be addressed in medical student education, residency training programmes and continuing medical education? The „Profile of a Psychiatrist” issued by the Psychiatry Section of the Union of European Medical Specialists may be a good starting point for structuring such novel curricula.

BROADENING THE BASES FOR INTERNATIONAL DIAGNOSIS: THE GLOBAL NETWORK OF CLASSIFICATION AND DIAGNOSTIC GROUPS

The goal of this Special Symposium of the WPA Global Network of Classification and Diagnostic Groups is to provide a forum to broadening the bases for international diagnosis. Specifically, this symposium will address unique contributions to psychiatric diagnosis and classification and considerations on the evolving development of ICD-11 and the Person-centered Integrative Diagnosis from five world perspectives. These include three contributions from the Americas covering the Caribbean, South American, and the Brazilian perspectives, three European perspectives covering German, French, and Nordic perspectives, three African and Middle Eastern contributions from Kenya, South Africa, and Syria and five contributions from Asia / Australasia including Chinese, Japanese, Korean, Taiwanese and Indian perspectives.
WPA GLOBAL NETWORK OF CLASSIFICATION AND DIAGNOSTIC GROUPS CONCEPTUAL AND OPERATIONAL OVERVIEW

INSTITUTIONS
1. WPA, United States

AUTHORS
1. Ihsan M. Salloum

The WPA Global Network of Classification and Diagnostic Groups is a network of diagnostic groups and classification sections of major Regional and National Societies and other key professional groups from across the world coordinated by the WPA Section on Classification, Diagnostic Assessment, and Nomenclature. The primary goal of the Global Network is to contribute to the emerging development of key international classification and diagnostic systems, such as the development of a Person-centered Integrative Diagnosis (PID) within the framework of the WPA Institutional Program on Psychiatry for the Person and the emerging revision of the International Classification of Diseases (ICD) Chapter on Mental Disorders led by the WHO Department of Mental Health, under the general guidance of the WHO Classification Office. To achieve the best possible classification and diagnostic systems to best serve the need of our profession across the world, it is crucial that various psychiatric traditions around the world be fully engaged in these processes.

AMERICAS CONTRIBUTIONS

INSTITUTIONS
1. Latin American Psychiatric Association (APAL), Cuba
2. The Peruvian Psychiatric Association, Peru
3. The Brazilian Psychiatric Association, Brazil

AUTHORS
1. Ángel Otero
2. Javier E. Saaverdra
3. Claudio Banzato

This presentation will review the rich historical contributions of the Americas to psychiatric classification and diagnosis and their current perspective on developing international classification and diagnostic systems and models. This will be represented by the Caribbean perspectives, such as the Cuban Glossary of Mental Disorders. The South American perspectives represented by Latin American Guidelines of Psychiatric Diagnosis and most recent epidemiological studies, and by the Brazilian perspectives and its ongoing contributions to psychiatric diagnosis. Comments on the evolving development of ICD-11 and the Person-centered Integrative Diagnosis will also be presented.
EUROPEAN CONTRIBUTIONS

INSTITUTIONS
1. The German Society of Psychiatry, Psychotherapy and Nervous Disorders (DGPPN), Germany
2. WPA French Member Societies Association Classification Group, France
3. Nordic Network for Cultural Psychology and Psychiatry (CPPN), Sweden

AUTHORS
1. Wolfgang Gaebel¹
2. Michel Botbol²
3. Henrik Wahlberg³

European contributions to past and future international classification and diagnostic systems and models will be discussed by three seminal continental perspectives. These include the German tradition and its fundamental influence on modern conception of psychopathology and the classification of mental disorders, the French perspective and its unique contribution to the classification and diagnosis of child and adolescent psychopathology, and the Nordic perspective with special focus on the role of culture. Comments on the evolving development of ICD-11 and the Person-centered Integrative Diagnosis will also be presented.

AFRICAN AND MIDDLE EASTERN CONTRIBUTIONS

INSTITUTIONS
1. The Kenya Psychiatric Association, Kenya
2. The South African Association of Psychiatrists, South Africa
3. The Syrian Arab Association of Psychiatry, Syrian Arab Republic

AUTHORS
1. Lukoye Atwoli¹
2. Werdie Van Standen²
3. Adib Essali³

International classification and diagnostic systems and models to be relevant on the global scale need the broadest bases of contributions from around the world. This presentation will address the unique contextual and historical contributions from three perspectives in Africa and Middle East. Comments on the evolving development of ICD-11 and the Person-centered Integrative Diagnosis will also be presented.
ASIA / AUSTRALASIA CONTRIBUTIONS

INSTITUTIONS
1. The Chinese Society of Psychiatry Classification Group, China
2. The Japanese Society of Psychiatry and Neurology, Japan
4. Taiwanese Society of Psychiatry, Taiwan Republic of China
5. The Indian Psychiatric Society, India

AUTHORS
1. Yan Fang Chen
2. Toshimasa Maruta
3. Young-Cho Chung
4. Chiao-Chicy Chen
5. Asit Baran Ghosh

This presentation will bring in the rich perspective and contributions from the most populated continent of our planet, representing rich heritage and wide geographical distributions. Five perspectives will be presented. These include formal classification systems such as the Chinese Classification of Mental Disorders, 3rd Edition, (CCMD-3) and related RTHD, along with academic contributions for other perspectives from Asia / Australasia. Comments on the evolving development of ICD-11 and the Person-centered Integrative Diagnosis will also be presented.

3. Juan E Mezzich

The goal of this Inter-Sectional Symposium is to engage the WPA Scientific Sections on collaboration for the emerging development of two major international projects on classification and diagnosis. These are the emerging revision of the International Classification of Diseases (ICD) Chapter on Mental Disorders led by the WHO Department of Mental Health, under the general guidance of the WHO Classification Office and, the development of a Person-centered Integrative Diagnosis (PID) within the framework of the WPA Institutional Program on Psychiatry for the Person. Perspectives from the following WPA Scientific Sections will be represented:

Section on Biological Psychiatry (Prof. Muhammed Abou-Saleh)
Section on Immunology and Psychiatry (Prof. Markus J. Schwarz)
Section on Child and Adolescent Psychiatry (Prof. Dimitris Anastopoulos)
Section on Addiction Psychiatry (Prof. Nady El Guebaly)
Section on OCD and Anxiety (Prof. Joseph Zohar)
Section on Impulsivity and Impulse Control Disorders (Prof. E. Gerard Moeller)
Section on Human Sexuality (Prof. Said Abdel Azim)
Section on Family Research and Intervention (Prof. Gabor I Keitner)
Section on Forensic Psychiatry (Prof. Julio Arboleda-Florez)
Section on Occupational Psychiatry (Prof. Satoru Shima)
Section on Mental Health Economics (Prof. Samuel H. Zuvekas)
Section on Interdisciplinary Collaboration (Prof. Uriel Halbreich)
Section on Art and Psychiatry (Prof. Hans-Otto Thomashoff)

Section on Classification, Diagnostic Assessment and Nomenclature (Prof. Ihsan M. Salloum), Section on Epidemiology and Public Health (Prof. James C. Anthony)
Section on History of Psychiatry (Prof. Paul Hoff)
Section on Psychopathology (Prof. Michael Musalek)
Section on Measurement Instruments in Psychiatry (Prof. Aleksandar Janca)
PERSON-CENTERED INTEGRATIVE DIAGNOSIS

INSTITUTIONS
1. Mt Sinai School of Medicine, New York, United States
2. University of Miami Miller School of Medicine, Miami, United States

AUTHORS
1. Juan E Mezzich
2. Ihsan M Salloum

This Special Symposium will present an overview of the emerging Person-centered Integrative Diagnosis discussing its purpose and architecture, its domains including pathology, suffering and disability as well as domains of positive aspects of health. The use of the PID in clinical care will then be discussed followed by a discussion of the research for and validation of the PID.

PURPOSES AND ARCHITECTURE OF THE PERSON-CENTERED INTEGRATIVE DIAGNOSIS (PID)

INSTITUTIONS
1. Mt Sinai School of Medicine, New York, United States

AUTHORS
1. Juan E. Mezzich

The primary purpose of the Person-centered Integrative Diagnosis (PID) is the description of the positive and negative aspects of health, interactively, within the person's life context. The PID would include the best possible classification of mental and general health disorders as well as the description of other health-related problems. Additionally, it will include a description of positive aspects of health, such as adaptive functioning, quality of life, and protective factors. Its aim is to attend to the totality of the person, including his/her dignity, values, and aspirations. This approach would employ categorical, dimensional, and narrative descriptive approaches. It will be formulated and applied interactively by clinicians, patients, and families.
I LL HEALTH DOMAIN: DISORDERS, SUFFERING AND DISABILITY

INSTITUTIONS
1. Campinas, SP, Brazil
2. Section on Psychiatry of Mental Retardation/Intellectual Disability, WPA, Spain
3. Imperial College of Science, Technology and Medicine, United Kingdom

AUTHORS

2. Luis Salvador-Carulla
3. Tom Sensky

The adoption of polythetic criteria sets for many psychiatric diagnostic categories, which first took place in DSM-III (1980), acknowledged somehow the existence of internal variability within diagnostic categories. Paradoxically, though such a move certainly brought psychiatric diagnosis closer to a fuzzy categorization model, the rule-based classifications with explicit diagnostic criteria were received by psychiatrists at large as neat and highly precise nosological maps. Besides, the emphasis on counting symptoms for sake of diagnostic algorithms contributed to obscure the fact that the assessment of psychiatric symptoms is a very complex task. One plausible option towards improving the clinical validity of psychiatric diagnosis is to replace current diagnostic criteria by multilevel psychopathological prototypes. Probably, the adoption of an actual and explicit prototypical approach could also concur to some decrease in the number of diagnostic labels, which would represent a welcome simplification of the diagnostic systems. In general everyday practice, a prototypical approach could be used not only for diagnostic categories but also for psychiatric symptoms. Besides, in order to complement the characterization of the clinical picture (presenting signs and symptoms), dimensional variables that cut across psychopathology such as, for instance, degree of subjective suffering and disability, could be recorded and linked to the nosological prototypical categories. Finally, these hybrid models could possibly be employed not only to describe ill health, but also to fully account for the health status of individuals.

POSITIVE HEALTH DOMAIN IN PERSON-CENTERED INTEGRATIVE DIAGNOSIS

INSTITUTIONS
1. Washington University, St Louis, United States
2. University of Melbourne, Melbourne, Australia

AUTHORS
1. C. Robert Cloninger
2. Helen Herrman

Person-centered integrative diagnosis is concerned with the assessment of the whole individual in a way that facilitates their recovery of mental health. The recovery of mental health involves more than just the reduction of symptoms and harm. Positive health involves the promotion of a satisfying quality of life, resilience despite stress, and recovery of positive emotionality. Essentially positive health refers to a state of well-being in which people are self-directed, able to cooperate and contribute to others, and have a sense of personal worth. Well-being can be reliably measured in several ways that all converge to identify the same individuals: the presence of positive emotions and the absence of negative emotions, mature character traits (particularly being self-directed, cooperative, and self-transcendent), life satisfaction or quality of life, and virtues (like hope and kindness). The absence of positive health is more predictive of morbidity and mortality than is the presence of negative health features. As a result, a psychiatry of the person must focus on assessing and communicating hope, kindness, and respect for the dignity of the person, rather than treating a person like a depersonalized case without dignity or hope. Thus the positive health domain is an essential part of assessment, the therapeutic alliance, and outcome assessment in person-centered integrative diagnosis.
USING PID INFORMATION FOR CLINICAL CARE

INSTITUTIONS
1. Istanbul Bilgi University, Istanbul, Turkey
2. University of Turku, Turku, Finland

AUTHORS
1. Levent Küey
2. Yrjö O. Alanen

Providing a diagnosis of both ill and positive aspects of health and serving as an informational bases for care are two main functions of the PID. This presentation will describe the applicability of the PID to clinical reality and needs, taking into account context and complexity of care. The PID emphasizes the totality of the person, considering his/her values and aspirations and on involving patients, families, and clinicians in an interactive partnership. Relevant experiences from the Need-Adapted Treatment model for Psychiatry for the Person and the PID will also be discussed.

RESEARCH FOR AND VALIDATION OF THE PERSON-CENTERED INTEGRATIVE DIAGNOSIS (PID)

INSTITUTIONS
1. University of Miami Miller School of Medicine, Miami, United States
2. University of Pittsburgh, Pittsburgh, United States

AUTHORS
1. Ihsan M. Salloum
2. Kenneth F Schaffner

The WPA Person-centered Integrative Diagnosis (PID) is a novel diagnostic model that proposes to expand the traditional diagnostic approach focusing on ill-health to a diagnosis focusing on health, encompassing both ill and positive aspects of health. The PID also conceptualizes diagnosis as a transformative process, involving all the protagonists of the diagnostic enterprise in a reified relationship. The two primary functions of the PID are to provide a diagnosis of health and to serve as the informational bases for care and public health with the goals of enhancing care, recovery and health restoration, prevention, and health promotion. Research validation of the PID will aim at establishing its clinical and public health reliability and validity as a diagnostic tool leading to enhanced processes of care and improved outcome, as a transformative process leading to enhanced partnership between the protagonists of care, and as an effective informational instrument leading to improved public health and service planning.
There are important challenges for researchers working in Africa. In mental health, the hurdles can be sometimes daunting. These include: 1) poor funding; 2) professional isolation; 3) lack of policy directive and motivation; 4) poor training and research infrastructure. In spite of the difficulties, some researchers on the continent are making significant contributions to knowledge in the fields of mental health and neuroscience. This symposium will highlight some of the barriers for scientific development in the field of mental health on the continent and identify opportunities that nevertheless exist for research.

Mood and anxiety disorders are amongst the most prevalent, burdensome, and costly of all medical disorders. Several factors make this an exciting time for research on these conditions; these include relevant advances in 1) nosology and epidemiology; 2) neuroscience; 3) psychopharmacological and psychotherapeutic interventions; 4) systems research in mental health, including evaluation of evidence and of costs; and 5) patient advocacy and mental health literacy. At the same time, there are important challenges facing mood and anxiety disorder researchers; these include 1) limitations of current diagnostic systems; 2) problems in attracting talented researchers to neuroscience and in obtaining sufficient funding; 3) a relative lack of controlled pharmacotherapeutic and psychotherapeutic studies undertaken outside the context of tertiary centres in the developed world; 4) ongoing gaps in systems research, including a relative lack of research on the effects of mental health policy, and 5) stigmatisation of mental illness and anti-scientific beliefs in the community. These challenges exist in both the developed and the developing world, but their scope may differ qualitatively and quantitatively.
MENTAL HEALTH RESEARCH CAPACITY IN AFRICA: A PROFILE OF SCARCITY AND CONSTRAINTS

INSTITUTIONS
1. University of Ibadan, Psychiatry, Ibadan, Nigeria

AUTHORS
1. Oye Gureje¹, Prof, DSc, ogureje@comui.edu.ng

In spite of their significant burden on the society, mental and neurological disorders receive inadequate research attention in most countries in Africa.

A survey was conducted on key researchers in 26 African countries in order to determine their strength, research goals and motivations as well as the general picture of the research environment in which they work. Researchers were identified through key international and local databases.

Results show a uniform pattern of low level of research activities in mental, neurological and behavioral disorders with the overall level of research personnel and research activities being grossly disproportionate to the populations of the countries. There was a general paucity of research infrastructural support such as specific research training, library support and internet access. External funding support was infrequent and most research activities were self-funded by the researchers. Many were working in relative isolation and most have to determine research goals as no national goals have been formulated by the governments. Despite the constraints, many continue to focus research attention on genuine areas of national needs.

The project highlights the need for more policy attention to the development of research capability on the continent. Such policy must include national consensus on areas of research need, development of research manpower, and focused and sustained funding for identified research goals.

SERVICE DEVELOPMENT IN NORTH AFRICA

INSTITUTIONS
1. AIN Shams University, Cairo, Egypt, Institute of psychiatry, Cairo, Egypt

AUTHORS
1. Tarek A. Okasha¹, Prof, MD, PhD, tokasha@internetegypt.com

Africa is a large continent, prone to strive, especially south of the Sahara. Mental health issues often come last on the list of priorities for policy makers due to many constraints mainly political, economical and infectious diseases. Mental Health services in the North African countries are rather different than what is present in Sub-Saharan Africa. In spite of the fact that some north African countries are suffering tremendously from many social, political and economic problems, yet mental health services are on the upraise compared to other branches in medicine. This presentation will highlight the geopolitical and demographic aspects of mental health services mainly in member societies in the North African (Egypt, Morocco, Tunisia, Sudan and Ethiopia). It will also discuss the impact of including mental health in primary care programs in our region, as well as scientific developments in Arabic speaking countries in Africa.
CHALLENGES OF MEDICAL SCIENCE DEVELOPMENT IN AFRICA

INSTITUTIONS
1. Upper Hill, Medical Center, Nairobi, Kenya, Nairobi, Kenya

AUTHORS
1. Frank G. Ngenga¹, Dr, FRCPsych, fnjenga@africaonline.co.ke

Medical scientific development in Africa poses great challenges and opportunities. The main challenge for mental health workers is to remain relevant in a world dictated by needs and other challenges that are perceived to be of greater and more immediate threat to life. Poverty alleviation, HIV/AIDS, Malaria and human habitation all seem to pose greater threats to the African and hence attract more funding and attention.

The recent Lancet series on mental health graphically illustrate the folly of this traditional approach. The burden of mental and neurological disorders worldwide is now well recognized and it is probable that the burden is similar if not greater in Africa.

Against this background, this paper explores the nature of the challenge to the medical scientific community in Africa, defines the prospects and proposes some solutions to the challenges. It is proposed that the public health model in which one seeks to establish the cause, the vector and the host might be a useful one. In this respect, we look specifically at the antecedents of some mental disorders, in particular their relationship to poverty, political turmoil, displacement both internal and external as well as the resulting post traumatic disorders. The role of the mental health expert as messenger of peace and reconciliation is examined against the background of his training.

PSYCHIATRIC DEVELOPMENTS IN NORTH AFRICA

INSTITUTIONS
1. Ain Shams University, Institute of Psychiatry, Cairo, Egypt

AUTHORS
1. Tarek A. Okasha¹

According to the ATLAS report released by the WHO in the year 2000, we will find that mental health resources are not as we believe. 43% of countries around the world have no mental health policy, 23% have no legislation on mental health, 38% have no community care facilities and 41% treatment for severe mental illness is unavailable in primary health care. In Europe, there are about 77,000 psychiatrists and 280,000 nurses for a population of about 840 million. While in Africa, there are about 1,200 to 1,500 psychiatrists and 12,000 nurses for a population of about 620 million. Africa is a large continent, prone to strife. Most of its countries are characterized by low incomes, high prevalence of communicable diseases and malnutrition, low life expectancy and poorly staffed services. Mental health issues often come last on the list of priorities for policy makers. Where mortality is still mostly the result of infectious diseases and malnutrition, the morbidity and disablement due to mental illness receive very little attention from the governments. This symposium will discuss mental health services in 5 counties from Northern Africa (Egypt, Morocco, Tunisia, Sudan and Ethiopia).
UPDATING PSYCHIATRIC DEVELOPMENT IN EGYPT

INSTITUTIONS
1. Ain Shams University, Institute of Psychiatry, Cairo, Egypt

AUTHORS
1. Tarek A. Okasha

Six hundred years ago, before Europe had mental health services in general hospitals, Egypt had such a service in Kalawoon hospital in Cairo, with 4 wards; surgery, medicine, ophthalmology and psychiatry. In 1942 Egypt started to implement the concept of psychiatric services in general hospitals. Egypt lies on the Mediterranean Sea; part of it lies in Africa and part of it (Sinai) lies in Asia. Egypt is considered African, Mediterranean, Arab and a Middle Eastern country at the same time. Egypt is one million square kilometers, with a population of 70 million. 97% of Egyptians live on 4% of the land mainly in the Delta region and the Nile valley. The population density in Egypt is 59/ sq. km, while the population in Cairo is about 15-16 million in the daytime, and approximately 12 million during the night. The population density in Cairo is 31,697 / sq. km. Egypt is divided into 26 governorates and has around 130,000 doctors, 1000 psychiatrists, 250 clinical psychologists and 1355 psychiatric nurses. Psychiatric services are provided through general hospitals, state hospitals, university hospitals and private hospitals amounting to about 10000 beds. Egypt is moving towards primary care in psychiatry through general practitioners and this has been incorporated into the National Mental Health Program for the past 12 years, rather than community care, which is not feasible because of financial, cultural and religious beliefs. This presentation will review the mental health services in Egypt at the moment together with future plans.

UPDATING PSYCHIATRIC DEVELOPMENT IN MOROCCO

INSTITUTIONS
1. Ibn Rushd University Psychiatric Center, Casablanca, Morocco

AUTHORS
1. Nadia Kadri

There are about 300 psychiatrists in Morocco, 620 psychiatric nurses, 75 clinical psychologists. There are very few social workers and no occupational therapist. The 3 academic departments in Casablanca, Rabat, and Marrakech are in charge of training psychiatrists and psychiatric nurses, as well as undergraduates. Concerning psychiatric institutions, there are 1,990 psychiatric beds in the entire country (30 million inhabitants) divided between psychiatric hospitals and psychiatric wards integrated into general hospitals. This low figure of psychiatric beds is even worse when one considers that there is no psychiatric institution for children and adolescents, and no private clinic in psychiatry. Most of the activities of mental health is done in the outpatient sector. For example, more than 60,000 patients are seen in the ambulatory mental health units of Casablanca every year. A recent national epidemiological survey will be finalized in the coming months and its results will allow planning for better mental health services.
UPDATING PSYCHIATRIC DEVELOPMENT IN SUDAN

INSTITUTIONS
1. Khartoum University, Psychiatry, Khartoum, Sudan

AUTHORS
1. Abdallah Abdelrahman1, a-abdelrahman@hotmail.com

Sudan is the largest country in Africa with a million Square miles, 33 million people and nine neighboring countries. As many countries in Africa Sudan suffered much from poverty, illiteracy, drought and civil war. The effects of these problems on the mental health of people are considerable. The objectives of this presentation are to highlight the situation of mental health services in the Sudan and share ideas with colleagues from other African countries in the region. Currently there is a great shortage of services, with one psychiatrist for a million populations. The majority of facilities are urban based with over 70% in the capital city Khartoum. Psychologists and psychiatric social workers are very few. Psychiatric medical assistants, act as psychiatrists in many regions. National mental health program had been established recently with a recognizable effort to improve the situation. Major areas of interest in the program include training of general practitioners, paramedical staff and teachers. Training manuals and material are in preparation. Despite many endeavors, the mental health act has not been endorsed yet. There are many constrains and health planners still need to be convinced and encouraged to put more emphasis on this issue. Mental health services at the primary health care level are an important priority. Training is crucial. With expectation of peace in the country soon, the future looks better. Mental Health in expected to improve.

UPDATING PSYCHIATRIC DEVELOPMENT IN TUNISIA

INSTITUTIONS
4. University of Tunis, Psychiatry, Tunis, Tunisia

AUTHORS
1. Saida Douki4, saida.douki@ch-le-vinatier.fr

Until recently, mental health was afforded low priority in Tunisia as in other developing countries faced with major health concerns such as epidemic diseases or infant mortality. Psychiatry has kept on being the « Cinderella » of medicine. Nowadays, only 150 psychiatrists (representing 4% of the total specialists) and 800 beds (representing 5% of the total hospital capacity) are available to a population of 10 millions souls. Consequently, a significant proportion of the population does not have access to mental health facilities. The result is a practice of “psychiatry in emergency” affording an immediate solution to severe psychiatric breakdowns but failing to provide sustained care or to deal with the many mental health problems challenging today our societies. But, this shortage gives us the great opportunity to build up a mental health care system more complying with the current knowledge and with our specific context. We have thus the unique chance to skip the deinstitutionalization stage with its significant casualties and to move directly to community care where a strong family support and a dense primary care network are major resources to rely on. This is the aim of the national mental health program adopted in 1992. It appears paradoxically that a lack of traditional services is probably the source of more opportunities than constraints in our countries, providing the possibility to implement the most cost-effective strategy to cope with the modern needs in matters of care.
Ethiopia is a country located in the Horn of Africa with a population of about seventy million. It is a federal government consisting of nine states representing over eighty nations and nationalities. The establishment of Modern Mental Health service in Ethiopia dates back to the time of the departure of Italian occupants in 1939 where the general hospital they used for the indigenous people was later turned into a mental asylum. For almost half a century, the Psychiatric hospital remained a place of confinement for the mentally ill and persons with behavior incompatible to the societal as well as political norms of the country. The department of Psychiatry was established in 1966 as a unit in the Department of Medicine by a Dutch Psychiatrist. Both the Psychiatric Hospital with 360 beds and the outpatient department in a general hospital in Addis Ababa, the capital of Ethiopia serve as treatment, training and research centers for the whole country. The department is run by three full time psychiatrists while in the Psychiatric hospital work five psychiatrists. All the Psychiatrists are stationed in Addis Ababa; therefore, most of the psychiatric service throughout the country is given by psychiatric nurses. Besides treatment service, the main activities include; teaching Clinical Psychiatry to Medical students, Psychiatric nurses and residents in Psychiatry. Continuing Medical Education to general medical practitioners and other specialists is also given on regular basis. Community oriented mental health research is also an integral part of the general mental health service in the country.

TRIPARTITE NATURE OF SELF-AWARE CONSCIOUSNESS

INSTITUTIONS
1. Washington University in St. Louis, Department of Psychiatry, School of Medicine, United States

AUTHORS
1. C. Robert Cloninger¹, clon@tci.wustl.edu

Human beings have three major systems for learning and memory: procedural learning of habits and skills, semantic learning of facts and propositions, and self-aware learning of pre-verbal intuitions and autobiographical narratives of episodes in one's life. These three systems have evolved and develop in a hierarchical manner but always operate in the processing of experience. In order to assess variability within each of these systems, Cloninger has developed measures of temperament, character, and self-aware experience in his book Feeling Good: The Science of Well-Being (OUP, 2004). Each of these domains has qualitative differences from the others and they interact in a non-linear dynamic manner. Clinicians lack an adequate phenomenological basis for understanding self-aware thought and its possible dysfunctions unless they assess each of these domains. Often people focus on differences in procedural learning (emotions and behavioral skills, as in Axis 1 phenomena), sometimes differences in semantic learning (character deficits, as in Axis 2 phenomena), and only rarely attend to self-aware experience. It is the initial perception in each sensibility and understanding are united that leads to self-aware thought and which makes us vulnerable to psychopathology. All three domains need to be assessed to understand the development of psychopathology. Focus on symptoms and behavior as in DSM-IV and ICD-10 neglects the fundamental dysfunctions that need to be recognized and treated to reduce vulnerability and to promote well-being.

STRUCTURE OF SELF IN SCHIZOPHRENIA

INSTITUTIONS
1. University of Copenhagen, Center for Subjectivity Research, Denmark

AUTHORS
1. Josef Parnas¹, jpa@hum.ku.dk

Recent empirical studies of first admitted patients with schizophrenia and schizotypal disorders confirm original clinical observations that these patients suffer from an array of abnormal self-experiences ("Ich-Störungen"). These disorders affect primarily articulation of self-awareness, yet including also a weak sense of self (self-reference). These disorders are analysed with respect to the phenomenological infra-structure of the first person perspective. A heuristic proposal is presented, integrating the disorders of the self within a neurodevelopmental model of schizophrenia.
Schizophrenia is a narrative which is meaningful in many ways, having for instance special meanings of the various psychopathological states for patients and their relations, or including stigmatising (=meaningful) allegories, metaphors and mythologies in our society. Not only patients suffering from schizophrenia live in a world of mythologies, but we all live in a world of allegories and metaphors. As cosmopoets we all create our world of symbols, images, and narratives. One of the major metaphors in psychiatry is diagnostic categories, definitions of mental disorders resulting in classification systems and complex scientific explanations with all their primary and secondary meanings (mythologies) for patients and therapies. Giving a natural phenomenon “professional meaning” with our diagnostic procedures (as definitions, descriptions of psychopathological phenomena, diagnostic attributions of pathological states, etc.) diagnosis takes meanings which go far beyond the primary meaning of pure psychopathological definitions. Some of these meanings exist for such a long time and are so well accepted by psychiatry community that one might get the impression that they do not represent narratives created by psychiatrists but the truth of nature. The process leading to such a metamorphosis from “the creation of man” to “the given from nature” we may call “de-historization”. The historical roots of narratives fall into oblivion and become facts of nature. It is the intention of this contribution to go into the matter of the meaning of schizophrenia’s narratives by “re-historizing” the diagnostics of schizophrenia in order to provide more insight in and understanding of the mythologies we are confronted with in dealing with patients suffering from psychoses.

MEDICINE FOR THE PERSON
INSTITUTIONS
1. International Center for Mental Health, Mount Sinai School of Medicine, New York, United States

AUTHORS
1. Juan E. Mezzich, JuanMezzich@aol.com

Person-centered medicine is an initiative seeking to promote a medicine of the person (of the totality of the person, including ill- and positive-health), for the person (striving to assist the person in the fulfillment of his/her life project), by the person (with clinicians extending themselves as full human beings with high ethical aspirations), and with the person (in respectful collaboration with persons presenting for evaluation and care). This initiative has as immediate precedent that on Person-centered Psychiatry. Its extension to general medicine is being formulated in collaboration with several major international medical and health organizations which are holding a major Conference on Person-centered Medicine in Geneva on May 2008.

Chairs: Juan E. Mezzich and Otmar Kloiber
Person-centered Health Care: From Mental Health to General Health
Juan E. Mezzich
The idea of Person-centered Health Care represents a full extension of the pioneering Person-centered Psychiatry and of the more recent Person-centered Medicine. It is hoped to inform the work of health professionals at large with a new sense of collaboration around the person of the patient and in search of integration of health and relevant social services.

World Medical Association Perspectives on Person-centered Medicine
Otmar Kloiber
The World Medical Association has been working for many years on ethical guidelines to protect persons in medical research with the name of Declaration of Helsinki. Also of relevance, it launched few years ago an initiative on Caring Physicians of the World. Now it is exploring in collaboration with other international medical and health organizations the concept of Person-centered Medicine.

Neurological Perspectives on Person-centered Medicine
Johan A. Aarli
The doctor-patient relationship has developed from unspecified good bedside manner to patient-centered medicine with an increased focus upon the recognition of patients’ ethical and legal rights. The medical decisions in a given clinical situation are made in the balance between the physician’s knowledge and experience, and the patient and his relatives’ values and preferences. Each clinical specialty presents with specific problems. Communicative care of an epileptic patient requires attention to the psychological and social consequences of epilepsy as well as to the control of the seizures. Treatment options preferred by the patients do not necessarily be medically optimal. Communicating a diagnosis such as conversion disorder may release opposition in the patient and family or coma, present special problem. Patients who have lost the capacity to participate in the decision process as a result of reduced mental capacity due to dementia, encephalopathy or coma, present special problem. Some patients with bulbar paresis with anarthria and generalized motor incapacity are unable to communicate their decision. Shared decision-making or surrogate-decision making may not always represent the true wishes of an incapacitated patient. The advances in modern genetics may represent future neuroethical challenges. Controversies will have to accompany the ethical legitimacy of using technologies that can modify the brain for the purpose of improvement.

Family Doctors’ Perspectives on Person-centered Medicine
Chris van Werd, president of Woneca
The family doctor’s perspective of personal care is determined by their role and function. Family physicians and other members of the primary care team encounter in their everyday practice a large variety of health problems – both in nature (physical and mental) and severity. This is the generalist function: in health care. In addition, family physicians usually care for patients over a longer period of time: personal continuity of care. As a consequence, family physicians see different diseases in the same patients, over time. This is an essential difference with any other medical specialty, that with its focus on disease, the role and function of family physicians and other primary care providers is closely related to the person. This is further emphasized in ageing populations and high prevalence of chronic diseases, in co-morbidity or multi-morbidity: patients suffering simultaneously from two or more chronic health problems. This shifts the focus from ‘disease management’ to person-centred care to take into account quality of life, perceived hinder and personal and social-cultural preferences. An important reason to promote person-centred care is the impact it has on the outcome of care, that is highest when provided in a combined competency of medical-instrumental and person and relational skills.

Patient/User Perspective on Person-centered Medicine
Jon Wallcraft
Here is a doctor’s summary of the meaning of ‘person-centred medicine’
A medical concept based on the acknowledgement of the fact that valuing and giving value to human life from conception to natural death is the ultimate justification of medical knowledge. The individual human being can never be the tool of science or of economic or political interests, laws, ideologies, theories or religious dogma... Person-centred medicine aims to modify the bio-molecular reductionist approach to medical science in favour of an integration which makes doctors, nurses and patients true protagonists of the health scenario. I am the head of the Milan Medical School of Università Ambrosiana, Director of Milan Medical School of Università Ambrosiana. My presentation will show, with evidence from consultations with patients of different medical services around the world, that there are many common demands from all patients, as well as some specific to particular groups. I will show that the plurality of complementary and holistic therapies is demonstrating that people generally want to be more involved in their own healthcare, that (and their families and carers) want more and better information, in language they can understand, and they want and need to be treated with dignity and respect.

There are many forms of expert patient training now being developed, which enable patients and service users to take a greater role in their own self-care, where this is possible.

Some organisations, such as the Princes Foundation for Integrated Medicine in the UK, have developed perspectives on integrated and holistic care, which brings in concepts of spirituality, a whole person approach and a re-integration of biochemical medicine with new and traditional forms of natural medicine and healing. I argue that traditional concepts of medicine were usually holistic, and that scientific medicine has moved away from this, for reasons of efficiency and scientific progress, but in doing so the majority of doctors have left behind the art of healing. The greater involvement of patients and service users in the late 20th and 21st centuries has meant there is a strong call to reintegrate medicine with healing and spirituality and bring patients and their families back to the central role in their own care and treatment.

Officially launched in 2004. Asia Australia Mental Health (AAMH) is a not for profit consortium of the University of Melbourne and St Vincent Health. It works in ten countries in Asia to extend integrated mental health care into the community. It does this by assisting senior mental health leaders and bureaucrats in these countries to develop appropriate strategies to build and sustain reform in community mental health service delivery within targeted countries. It also works to strengthen capacity to facilitate the implementation of community mental health services in these countries. It is active in working with these leaders to ensure that each country develops its program in a culturally sensitive and appropriate way. In this symposium Professor Singh will describe AAMH, its history and mission and its achievements to date. Associate Professor Ng will detail the current major projects being implemented in the region and Professor Ma Hong from the Institute of Mental Health at Peking University, one of our partner organisations will describe the work being done in the People’s Republic of China.

AAMH is a consortium of the University of Melbourne and one of its major teaching hospitals - St Vincent’s Health. It was formed to foster and support the development of integrated mental health care in the Asia-Pacific region. Its credibility is founded on 20 years of history of knowledge, experience and involvement in the region by senior members of both organisations and their knowledge of implementation of community mental health in Australia. In this presentation AAMH structures, function, mission and achievements to date will be detailed.
FACILITATING COMMUNITY MENTAL HEALTH REFORM IN THE ASIA PACIFIC

INSTITUTIONS
1. University of Melbourne, Faculty of Medicine, Dentistry and Health Sciences, Melbourne, Australia

AUTHORS
1. Chee Ng, Assoc Prof, MD

Community mental health services are generally inadequately developed in many parts of the Asia-Pacific. Asia-Australia Mental Health is working in partnership with mental health policy makers and leaders across the Asia-Pacific to facilitate the development and implementation of community mental health service models that are both culturally sensitive and based on best practice principles. Ideally, international collaboration in system development is maximised when it is based on principles of genuine partnership, multi-level engagement and bilateral government support. The broad socio-economic and political restraints must be understood for each country and models cannot simply be translated from culture to culture. It is important to build in flexibility for different entry points and timing for health reforms to take into account the beliefs, attitudes, and resources of the local context. Reform needs to embrace and occur at all levels and sectors, and attitudes and commitment must be influenced in partnership. As it is also essential to establish a working and supportive network for reform, the Asia-Pacific Community Mental Health Development Plan originally initiated by WHO is addressing contemporary practical approaches to community health care in the region.

NATIONAL MENTAL HEALTH SERVICES MODEL REFORM PROGRAM IN CHINA (PART 1)

INSTITUTIONS
1. Peking University, China

AUTHORS
1. Hong MA, Professor
2. Xin YU, Professor

China has built a hospital and community integrated model for continuing monitoring and management of people with psychoses has been built in demonstration areas in 30 provinces in China. After SARS, Chinese government decided to rebuild public health system. In April to May 2004, China CDC and Peking University visited community mental health in Melbourne, and then decided to use Victorian Model for reference. On September 30 2004, after competing with more than 50 other proposals, Mental Health Service Model Reform Program was included as the only non-communicable disease program into national public health program. In December 2004, it was formally supported by Ministry of Finance, and was called "686 Program" for its 6.86 million fund. National Center for Mental Health, China-CDC took charge of this program and built national working group as well as foreign consultant group with experts mainly from the University of Melbourne. In 2005, demonstration areas were established and different groups of people were trained. In 2006 and 2007, people with psychoses were intervened and followed up. In 2008, the program will be continued. To ensure the systematic training on case management for the workforce and capacity building, Asia-Australia Mental Health, The National Institute of Mental Health at Peking University and the Chinese University of Hong Kong have formed a tripartite train-the-trainer program for mental health professionals in the demonstration sites.
NATIONAL MENTAL HEALTH SERVICE MODEL REFORM PROGRAM IN CHINA (PART 2)

INSTITUTIONS
1. Peking University, China

AUTHORS
1. Xin Yu¹, Professor
2. Hong Ma¹, Professor

In the 686 integrated community mental health care project, a total of 60 demonstration areas were built in 30 provinces in China, 1 urban and 1 rural area in each province, covering a population of 43 million. Totally 602 training courses were held and nearly 30,000 people trained, among whom were psychiatrists, community physicians, case managers, community workers, public security staff and family members of the patients. National computerized case database was also built. In 2006, this program received 10 million RMB. Monitoring and intervention network for psychoses, as well as local comprehensive prevention and treatment team was built in each demonstration area. Over 12000 people including 15% psychiatrists and psychiatric nurses were involved. The record system of the psychotics was primarily built into network through information stations located in 60 demonstration areas. By December 31, 2006, a total of more than 65,000 patients were registered and archived, near 22,000 patients with violence tendency followed up periodically, over 9,000 poor patients with violence tendency provided free medication, over 26 hundred person-times of violent behaviors provided free crisis management, and more than 1,000 poor patients with violent behaviors provided free hospitalization. Severity of violence of followed up patients decreased. The budget of 2007 was 15 million RMB, which continuously supported the same contents as that in 2006 in 60 demonstration areas. The budget for 2008 is 27.35 million RMB, and more patients can get free medication and hospitalization, and one new demonstration area will be set up in Xinjiang Province.

Objective of the symposium: To focus on the relevance of community psychiatry with special reference to the developing world and to discuss the future perspectives. The speakers will discuss the current scenario, the obstacles in the path for development and the future goals. A road map for concerted action will be presented.
COMMUNITY PSYCHIATRY IN DEVELOPING WORLD: AN OVERVIEW

INSTITUTIONS
1. Medical College, Thrissur, Psychiatry, Trichur, India

AUTHORS
1. Roy Abraham Kallivayalil, Prof, MD, roykallivayalil@dataone.in roykalli@gmail.com

Community Psychiatry in the developing world grew mostly under the western model, but had to face massive constraints- lack of facilities, inadequate manpower and poor resource allocation. Long term care in mental hospitals appeared to be counterproductive. Unfortunately, institutional psychiatry, where trained professionals worked, was often expensive. Also there was severe shortage of trained mental health professionals. The establishment of large number of General Hospital Psychiatry Units in countries like India has revolutionised mental health care. Such units were in much closer proximity to the community. Patient no longer had to travel long distances to seek treatment.

Looking ahead, there are no simple answers. Establishment of PHC based rural mental health programme, GP based urban mental health programme, school mental health programmes, home based follow-up, Psychiatry medical camps can all be innovative. National Mental Health Programmes will facilitate community psychiatry greatly. This will make minimum mental health care to people available and accessible. The starting of District Mental Health Programme in India has been well received.

Teaching Psychiatry in undergraduate medical training, training lay counselors and social workers, co-operation with religious and spiritual centres, planning special programmes for children, women and the elderly, increased use of psychosocial methods in treatment and continuous monitoring and evaluation will make community psychiatry in developing nations more meaningful and useful.

COMMUNITY PSYCHIATRY IN BANGLADESH

INSTITUTIONS
2. National Institute of Mental Health, Psychiatry, Dhaka, Bangladesh

AUTHORS
1. A. H. M. Mustafizur Rahman, Dr, MD, bap@agni.com

Qualified psychiatrists and trained manpower are required for development of effective community mental health services. In Bangladesh there are only 100 plus psychiatrists to provide services in the country. Considering this deficit 25 Civil Surgeons, 3500 Primary Health Care Physicians, 5500 Health Workers and 172 Imams were trained on psychiatry in Bangladesh. Extension of training programme to nurses, teachers, traditional healers and village leaders may be needed for effective community services in the developing countries.

In Bangladesh 4 model upazilla for CBAs in mental health around Dhaka city has been undertaken to start the community based service. Primary health care physicians are working in these model upazilla health complexes were trained on psychiatry so that they can manage mentally ill people at door step. The field level workers and nursing staffs in these model upazilla health complexes were also trained on mental health so that they can identify and can take care of mental ill patients in the locality.

Awareness development programme in the 4 model upazilla was completed. So far 2800 people attended the community awareness programme on mental health. In December 2007 one outreach treatment programme has been started at one model upazilla health complex. Local doctors and nurse have been involved in the programme. Psychiatrists from NIMH, Dhaka, visit the outreach centre weekly and medicines are supplied free to the patients. So far the response from the community regarding treatment of mentally ill patients is satisfactory.
COMMUNITY PSYCHIATRY IN SOUTH ASIA:
ACHIEVEMENTS SO FAR

INSTITUTIONS
3. All India Institute of Medical Sciences, Psychiatry, New Delhi, India

AUTHORS
1. Rakesh Kumar Chadda¹, Prof, MD, drrakeshchadda@hotmail.com

Community psychiatry movement in South Asia is relatively new. Most of the countries in South Asia like India, Pakistan, Nepal, Bangladesh and Bhutan don’t have adequate mental health resources. Psychiatric services consist of general hospital psychiatric units, mental hospitals and private psychiatrists with chamber practice. The services are mainly confined to the big cities. India was the first country to initiate its National Mental Health Programme in 1982 with community outreach and integration of mental health in general medical services being the main objectives. The programme has now covered nearly one fifth of the country by making districts as the nodal agencies and envisages training the primary care physicians and other health workers to provide basic mental health care. Sri Lanka has increased the curriculum in psychiatry at the undergraduate level so as to equip their medical graduates and hence equipping the primary care physicians to take care of mental health problems of the populace. Other experiments include running of the satellite clinics by the psychiatrists in the community, organising mental health awareness camps during the world mental health week. Still lot needs to be done, as the resources are limited. India has taken lead in the community mental health, followed by the other South Asian countries.

A number of obstacles and barriers have been identified in smooth and rapid scaling of such services in the developing countries. Often cited such obstacles are lack of adequate financial resources allocated to mental health, inequality of provision of the resources within a country in different regions, lack of adequate human resources, low priority accrued to mental health by the policy makers and planners, high prevalence of stigma and negative attitudes, and misconceptions about mental health among the decision makers, general medical and other health staff and members of the community, and prevalence of low mental health literacy rate among the general public and elites of the health-community. These factors (obstacles) can be divided into two major groups; the resource related and the cognitive and attitudinal. Besides this group of obstacles, the cognitive and attitudinal factors are also extremely important in search, allocation and preparation of the resources, and making those available in setting up or expansion of services. Due to high and pervasive prevalence of these obstacles, whatever resources are available for health, non or nominal is allocated to mental health leading to gross discrepancy in allocation to health conditions with equal public health importance. It is very crucial to identify, define, delineate and rectify this particular group of obstacles, namely cognitive and attitudinal obstacles and also of course concerted major initiatives have to be taken up in resolving or minimizing the resource related obstacles.
COMMUNITY PSYCHIATRY: EMERGING SPECIALITIES AND THEIR RELEVANCE

INSTITUTIONS

1. T. Sathyanarayana Rao, Prof, MD, tsrao19@gmail.com

The developing countries have a typical problem of burgeoning population, poverty and a skewed distribution of the prosperity, illiteracy and the gender disparity, increasing rates of crime and the added issue of terrorism, lack of sex education and the consequent rising rates of STDs and HIV, infrastructure bottlenecks on the one hand and emerging information technology on the other. Psychiatry is still a not so coveted subject in medical curriculum leading to the medical professionals lacking in psychiatric skills to manage the problems at peripheries with concentration of facilities in urban areas. Though significant changes have happened with governmental programmes, arrival of general hospital psychiatry units and emergence of private psychiatry, still the specialization is a distant dream. The emphasis on special populations like children, adolescents, women and geriatric population is a crying need at present. Specialization so also special centers attending to special areas like sexuality, substance abuse and positive mental health are the necessity. The paper attempts to look into the existing scenario with emphasis on sexualities and makes suggestions for tackling the above issues from the perspectives of the developing countries.

COMMUNITY PSYCHIATRY IN DEVELOPING COUNTRIES: FUTURE PERSPECTIVES

INSTITUTIONS

The place of mental health care as a part of general health has significantly changed during the last 60 years. This has changed over the years and mental health issues are actively seen as a part of public agenda in the various forms. There has been some focus on the mental health care and it has grown from being non-existent to having some presence however despite the progress in mental health care the needs of the population are largely unmet. The problem faced by the health services include persistent gaps in manpower and infrastructure, especially at the primary health care level; the sub-optimal functioning of primary care, a large number of hospitals without appropriate manpower, diagnostic or therapeutic services, poor use of services in the most needy areas, inadequate inter-sectoral linkages. In the past few decades we have witnessed radical changes in the political, economical and social conditions. There has been some growth in the mental health care but it has not been enough to meet the needs of the community. Our community programs need to be tuned to the changing times and need basic reforms. The necessary steps to meet the mental health care needs include training the undergraduates, physicians and the community.

There is a large population the world over, which is rural and remotely based.
The ability to access, avail or accept mental health services are poor in rural areas. Populations who are marginalized experience isolation and discrimination in generic and specialist services. Despite anecdotal reports on a more cohesive social capital in rural communities, there exist groups of remotely based people who live in relative deprivation; poor housing; low income and lack of job opportunities. They are often excluded from areas of social life. Isolation and lack of mobility contribute to stigma and poor social integration.

This symposium provides a global perspective on the varying social contexts in rural settings that impinge on mental health care. Specific groups discussed are:
1. Young people and their vulnerabilities including early psychoses
2. Drug and Alcohol issues
3. Indigenous people and their co-existing physical and mental illnesses
4. Farming communities, Depression and suicidal behaviour
5. Other marginalized populations in remote areas from different cultural settings.

The speakers focus on country perspectives from Australia, China, Egypt, Turkey and the USA.

Conclusion:
In developing quality mental health care, there is a need to understand factors that cause social alienation and stigma in “hard to reach communities”. There is a need to build partnership with the voluntary sector and social agencies and the already available protective fabric of the rural communities.

RURAL MENTAL HEALTH IN AMERICA

INSTITUTIONS
1. WFMH, Mental Health, Springfield, United States

AUTHORS
1. Preston Garrison

During the “great American farm crisis” of the late 1980’s, the National Mental Health Association in the United States initiated an effort to gauge the extent to which the mental health of farm and rural families was being affected by the economic and social turmoil in states across the nation. The mid- and late 1980s represented a dark time for America’s “family farms,” and was often compared to the “Dust Bowl” days of the 1920’s and 1930’s - except this time, changing approaches to farming, the advent of mega agribusiness operations, and a tremendous number of bankruptcies and loan foreclosures replaced drought, windstorms and pestilence as the primary drivers of farm failure and disruption. What does rural America’s mental health look like today? What is the situation today in America’s “heartlands,” and what does it represent in the way of “lessons learned” relating to the way in which the mental health needs of rural Americans are viewed and addressed some 20+ years later? This presentation will share some findings from recent reports and policy documents — all of which seem to conclude that not a great deal has been accomplished in fulfilling the promise of improved mental health care prevention, policies and practices in rural America.
CHINESE MENTAL HEALTH CARE SYSTEM: PRESENT AND FUTURE

INSTITUTIONS

AUTHORS
1. Yangfan Chen¹, Dr., M.D., chenyf@jn-public.sd.cninfo.net

The integration of community-based and hospital-based mental health care systems has assumed an increasingly important role. This paper will present an electro diagnostic instrument to help integrate community-based and hospital-based mental health care systems, and introduce a regional program, the Yantai Model of hospital-based mental health care combined with community-based mental health care in a rural area of China. It could be established within the constraints of the limited economic resources available.

USING TECHNOLOGY TO REACH YOUNG PEOPLE IN RURAL AUSTRALIA

INSTITUTIONS
1. Melbourne University, Orygen, Melbourne, Australia

AUTHORS
1. Jane Burns¹, Dr., Ph.D., jane@inspire.org.au

Aims/Objectives: Rural adolescents face stressors that may affect mental health, such as physical isolation, loneliness, limited access to health services, lack of privacy, and economic instability. To date, an understanding of the factors that may impact on help seeking in rural communities is limited.

Methods: Survey data was collected from 1711 Year 10 students (AGE 15.11 SD=0.39) from 52 schools in rural and regional South Australia.

Results: Fewer males than females recognized they had a problem and acknowledged they needed help. Adolescents sought help from parents and friends more often than from professional sources. Females had greater help-seeking knowledge and intentions than did males. The most frequently reported barrier to seeking help was the desire to deal with the problem personally. Males from rural areas were more likely to indicate that they did not know how to find help than males from regional areas.

Conclusion: Reach Out! (www.reachout.com.au) is a confidential and anonymous online service that provides information on mental health, referrals to appropriate sources of help, and stories about how other young people have dealt with and overcome adversity. The initiative, using multi-media techniques, promotes positive images of young people to improve mental health literacy, increase help-seeking and enhance resilience. The potential of web-based services in rural communities and their relevance in clinical practice, preventive interventions and health promotion campaigns needs further consideration. 1. MENTAL HEALTH SERVICES IN EGYPT-A RURAL ACTION PLAN

INSTITUTIONS
1. Institute of Psychiatry, Ain Shams University, Psychiatry, Cairo, Egypt

AUTHORS
1. Tarek Okasha¹, Dr., M.D., tokasha@internetegypt.com

Six hundred years ago, before Europe had mental health services in general hospitals, Egypt had such a service in Kalawoon hospital in Cairo, with 4 wards; surgery, medicine, ophthalmology and psychiatry. In 1942 Egypt started to implement the concept of psychiatric services in general hospitals. Egypt lies on the Mediterranean Sea; part of it lies in Africa and part of it (Sinai) lies in Asia. Egypt is considered an African, Mediterranean, Arab and a Middle Eastern country at the same time. Egypt has a population of 70 million. Egypt is divided into 26 governorates and has around 130,000 doctors, 1000 psychiatrists, 250 clinical psychologists and 1355 psychiatric nurses. Psychiatric services are provided through general hospitals, state hospitals, university hospitals and private hospitals amounting to about 9000 beds. Egypt is moving towards primary care in psychiatry through general practitioners and this has been incorporated into the National Mental Health Program for the past 12 years, rather than community care, which is not feasible because of financial, cultural and religious beliefs. This presentation will review the mental health services action plans for rural areas in Egypt at the moment together with future plans.

ROLE OF PRIMARY HEALTH CARE WORKERS IN RURAL MENTAL HEALTH SERVICE IN TURKEY

INSTITUTIONS
1. Kocaeli University, psychiatry, Kocaeli, Turkey

AUTHORS
1. Bulent Coskun¹, Dr., Md, 8bulentcoskun@gmail.com

In this presentation after a brief introductory information about rural health services in Turkey different examples of activities and difficulties regarding improvement of mental health services in rural areas, with some comparative references from urban areas will be shared.
Role of primary health care workers in the development and improvement of these services will be emphasized. The importance of presence and lack of interdisciplinary and intersectoral cooperation will be touched upon with some special examples from the field.
It is believed that the reactions and recommendations of the participants will be helpful to bring back to the workers of primary health care in these areas.
EXTENSION OF MENTAL HEALTH SERVICES IN RURAL SETTINGS

INSTITUTIONS
1. Fatima jinnah Medical College, Psychiatry, Lahore, Pakistan

AUTHORS
1. Haroon Choudhry, Dr., M.D., pprc@wol.net.pk

People living in rural communities face additional barriers to receive effective prevention and treatment services for mental health problems. Access to and availability of mental health specialists are seriously lacking. Poverty, geographic isolation, and cultural differences further limit the amount and quality of mental health prevention and treatment services available to individuals in rural areas. The barriers such as limited insurance coverage, scarce availability of services, and stigma must be overcome in order to achieve further progress in preventing and reducing the toll of mental problems. Although a variety of well-established interventions are available but they are not reaching many who need them. In order to improve mental health services in the region, the focus can be to stimulate research on mental health problems in rural communities that will enhance understanding of structural (including community risk and resilience factors), cultural, and individual factors that may enhance the provision and utilization of prevention and treatment services in these communities and to generate knowledge to improve the organization, financing, efficiency, effectiveness, quality, and outcomes of mental health services in rural populations. Community involvement may contribute a useful role in provision of mental health facilities. In addition, the presentation will address the following:

Training of local GPs and paramedics.
Free camps are organized weekly, monthly, quarterly and annually.
Community education programmes on mental health for general public.

BODY, SEXUALITY AND INTIMACY IN “MILIEU” TREATMENTS DURING ADOLESCENCE

INSTITUTIONS
1. WPA Zonal Representative, Paris, France

AUTHORS
1. Michel Botbol

The body is a favoured way of communication during adolescence; in the context of a “milieu” treatment at this age, it can be considered as a crucial part of the patient’s psychic economy. It allows him to frame and project his psychic conflicts and the fore relieves his psychic system and his fear of losing control.

In milieu therapy the institution is at the same time a therapeutic and a living space. It, condenses in a same place the intimate sphere and the collective dimension. This is why the sexual body which has become for the troubled adolescent an “intimate stranger” or even “intimate enemy”, becomes a “troublemaker” that everybody would like to forget. Source of excitement, it may lead to massive defensive counter investments.

Our work aims at exploring more deeply the possible disjunctions and articulations between body, sexuality and intimacy in this context of a milieu treatment for adolescents and young adults. Clinical vignettes will be presented to illustrate this work.
MENTAL HEALTH ON COLLEGE CAMPUSES: AMERICAN PSYCHIATRIC ASSOCIATION PRESIDENTIAL TASK FORCE

INSTITUTIONS
1. University of Michigan, United States

AUTHORS
1. Michelle Riba

Mental health on college campuses is a critically important area. In the United States, in 2004, the American Psychiatric Association developed a Presidential Task Force to address the multiple and complicated issues involved. The Task Force, comprised of adult and child psychiatrists, pediatricians, and students proposed an agenda for review and projects to be delineated. In addition, at college campuses, such as the University of Michigan, yearly conferences are being held to address ways to help students and practitioners understand the role of depression, anxiety, sleep, stress, alcohol and substance use and abuse. This presentation will help to provide participants with an update on the work of the Task Force and local efforts to better screen, evaluate and treat students for mental health problems.

ACTUALITY OF THE PSYCHODYNAMIC APPROACHES OF EATING DISORDERS

INSTITUTIONS
1. Paris VI University, IMM, Service de Psychopathologie de l’adolescent et du jeune adulte, Paris, France

AUTHORS
1. Maurice Corcos

The experience of our ward is based on a population of severe anorexic and bulimic patients with major symptoms evolving over several years. This practice that combines a large number of cases and long term personalized individual treatments, has enabled the emergence of a certain amount of data raising a number of questions related to the mental functioning of these patients. This has led us to believe that the core impairment of these adolescents lies within their personality characteristics and their capacity to deal with conflicts and particularly to feel and contain depressive affects. These patients’ relationship to others is similar to their relationship to food, both taking a paradoxical pattern: - An alternating between great eagerness for relationship and isolation or withdrawal, with intolerance for loneliness as well as for closeness. - A great awareness about others’ attitudes and opinions, often in a hypersensitive manner - Difficulties in regulating relationship and finding optimal distancing with others: violent turnabouts from idealized attachment to total rupture, vindictiveness, and even outright hostility when faced with the least deception. - Oscillation between anxiety related to fear of separation and anxiety related to fear of intrusion - Coexistence of exacerbated expectations concerning important people, along with the ability to be easily influenced, and at the same time exacerbated trend to opposition and obstinate refuse of change

All these characteristics are grounded in a common dependency problematic. In all these personality traits we find a predisposition to exaggerated dependency toward certain persons in the concrete world: parents, siblings etc… with an obvious lack of autonomy and zones of confusion between the patient and these persons In a psychodynamic perspective, we see the anorectic and bulimic conducts as defensive processes aiming to reorganize patient’s objectal relations, that is to say: its difficulty to cope with the antagonism between his objectal inclinations and his need to protect their narcissistic balance. Therapeutic consequences are discussed.
TAUREAREA: COMING IN AGE IN TAHTI

INSTITUTIONS
1. Psychiatrist, Papeete, French Polynesia

AUTHORS
1. Frédéric Atger
2. Ioanna Atger

Our three year psychiatry practice in the only community adolescent outpatient center that we created in Papeete (Tahiti) confronted us to a great frequency of conduct disorders such as school refusal, drug addiction, elopes, suicidal attempts and early pregnancies. These disorders appeared mainly in highly disturbed families, without psychiatric pathologies but presenting transgenerational traumatic history in which the central elements are discontinuous relationships. Treatment of the adolescent and his family (always eager to participate) leads to rapid and dramatic improvement. We will discuss the influence of cultural factors upon the quality of early mother-infant interactions followed by repeated separations (faʻamu adoptions). The transition to adolescence (taurearea) in traditional Tahitian culture and its changes following the European contact will also be questioned.

FORENSIC PSYCHIATRY IN DUBIOUS ASCENT

INSTITUTIONS
1. Institute of Forensic Psychiatry, Charité University Medicine Berlin, Berlin, Germany

AUTHORS
1. Norbert Konrad, norbert.konrad@charite.de

Successful treatment of mentally ill offenders in catamnestic studies, measured by the recurrence rate of criminal behavior, has improved the reputation of forensic psychiatry but has also increased the expectations placed upon it. Forensic psychiatry is generally attributed with greater competence with regard to prevention of criminal recidivism, even if studies comparing recidivism after release from forensic-psychiatric hospitals with that from prisons are, at least, methodologically problematic due to the uncontrollable selection effects. The attribution of higher competence is accompanied by the hitherto unfulfilled expectation that forensic psychiatry can decisively reduce the relapse rate in individuals with personality disorders, especially in offenders with dissocial personality disorders, as found in the international psychiatric classification systems, particularly the subgroup of “psychopaths”. There is a special need for therapy research in these patient groups that are rejected by many - even forensic - psychiatrists.

THE CRIMINALIZATION OF THE MENTALLY ILL IN CANADA

INSTITUTIONS
1. Queens University, Kingston, Ontario, Canada

AUTHORS
1. Heather Stuart, heather.stuart@queensu.ca

This presentation will review mental health reform in Canada focusing on three waves of institutional reforms. In the first wave, occurring between the mid 1960’s and the early 1980’s, the focus was on reducing the size of mental hospitals by 70-80% in the short span of 15 years. During this time, governments increasingly invested in general hospital psychiatric beds as an alternative to institutional care. By 1990, there were almost as many days of psychiatric care provided in general hospital psychiatric units as mental hospitals. However, community-based supports and services remained wholly inadequate, leading to host of poor social outcomes. Surveys of incarcerated population showed the high prevalence of mental illness in correctional populations. Correctional institutions had replaced mental hospitals as the main source of institutional support for large numbers of mentally ill. The corresponding rise of forensic services to deal with the mental health needs of inmate populations meant that it was easier to obtain access to a mental health ‘bed’ through the correctional system than through health care system - a situation that was heavily exploited by busy police officers who were increasingly forced to choose between care and control. The third wave of institutional reform has focused on correctional facilities, seen in the rise of stop-gap diversionary mechanisms aimed at reducing the number of mentally ill offenders in justice and correctional settings. Though most mental health reform policies acknowledge the importance of addressing the needs of mentally disordered offenders in the evolving community mental health system, progress has been slow.
BRAZILIAN PSYCHIATRIC REFORM: ITS IMPACT ON THE FORENSIC PSYCHIATRIC PRACTICE

INSTITUTIONS
1. Federal University of Health Sciences of Porto Alegre, Psychiatry and Forensic Medicine, Porto Alegre, Brazil

AUTHORS
1. Jose Taborda, jose@taborda.med.br

Since Caracas Declaration, Brazilian authorities on public health have changed the model of psychiatric attention. This new model, fulfilled with a strong ideological bias, has tried to follow the steps of the 1970’s Italian Psychiatric Reform. Many psychiatric hospitals were closed, the total number of psychiatric beds has diminished and, as a consequence, there has been an increased disassistance and abandonment of the mental patients. Many of them are on the streets. Others, in the prisons. Nowadays, it has been estimated that there are more mental patients in prisons than in psychiatric hospitals. The city of Porto Alegre holds the largest Brazilian prison, with more than 4000 in-mates. This population is cared for by very few forensic psychiatrists. The author displays some figures and discusses the related ethical issues.

ETHICAL ISSUE IN ELDERLY FORENSIC PSYCHIATRY

INSTITUTIONS
1. Forensic Psychiatry Hospital Stei, Stei, Romania

AUTHORS
1. Nicoleta Tataru, nicoleta_tataru@hotmail.com

We discuss about the assessment of competence in dementia and ethical aspect of care and research in elderly demented people and about involuntary commitment of incompetent patients. We also refer to the complications and difficulties when trying to apply the civil commitments compulsive hospital admission measure, foreseen in the law for mental health, when the dementia diagnostic falls within this age group. Historically, involuntary commitment of incompetent patients took in the consideration the best interest of the patient, but also the well-being of the family and the potential risk for others. After a short review of legislation and of conditions of hospitalization concerning involuntary commitment of the mentally ill people during our history before and after 1989, we’ll analyze the activity on involuntary commitment in a Forensic Psychiatry Hospital in district Bihor, in last five years from a 30 years experience working in the field. Standards and practice in our country regarding the involuntary commitment have been changed more that three times after the second War and has been improved in 2002, when there appeared the new Mental Health Law, emphasizing protection of patients’ rights. There are legal and ethical limits to involuntary hospitalisation, because involuntary treatment and hospitalisation restricts a person’s liberty. There should be a lot of things to do to improve the quality standards: improvement of elementary care needs, improvement of their quality of life.
FORENSIC PSYCHIATRY: THE LEGAL BATTLEGROUND OF PSYCHIATRIC ETHICS

INSTITUTIONS
1. Queen’s University, Kingston, Ontario, Canada

AUTHORS
1. Julio Arboleda-Flórez, julio.arboleda-florez@queensu.ca

A review of ethical challenges facing the clinical practice of Psychiatry and its research endeavours clearly points to major concerns at three levels, the ethics at the medical physician-patient or at the research investigator-subject encounter, the ethics affecting systems and the ethics at the macro level of public health. But whereas in general Psychiatry most of the ethical issues centre in the physician-patient relationship, ethical issues of major importance in Forensic Psychiatry impact at any of the three levels mentioned. In addition, those ethical challenges in the practice and research endeavours in Forensic Psychiatry, are multiplied by the legal obligations to report to third parties. Ethical binds caused by double agency obligations are, therefore, a constant in the professional interactions of forensic practitioners. This presentation will review the issues impacting on forensic ethics and double agency situations.

MENTAL HEALTH ACTIVITIES FOR EARTHQUAKE SURVIVORS - EXPERIENCE FROM PAKISTAN

INSTITUTIONS
1. Fatima Jinnah Medical College/Sir Ganga Ram Hospital, Psychiatry, Lahore, Pakistan

AUTHORS
1. Haroon Rashid Chaudhry¹, Prof., pprc@wol.net.pk

On 8th October 2005, a devastating Earthquake struck the North East part of Pakistan leaving three million people homeless. A number of people became injured and countless people died.

Mental Health treatment teams comprising doctors, psychologists, social workers, psychiatric nurses and volunteers were sent to the Earthquake affected areas to provide crises intervention for survivors and their families by identifying people at risk to develop psychological disorders later in the future and promoting resilience and recovery in the community. They conducted different activities in coordination with other mental health teams. Many training workshops for volunteers, general physicians, under graduate and post graduate medical students, community workers and caregivers were conducted at different educational and health institutions of Lahore.

Two model Psychosocial Rehabilitation centers were also established at Muzaffarabad and Balakot for the Earthquake survivors proposed by WPA Section on Psychiatry in developing countries.

In January 2006, an international symposium on “Disaster Management & Psychosocial Rehabilitation of Earthquake survivors” was organized by WPA (Zone-15) & WPA Section on Psychiatry in Developing in collaboration with other international mental health organizations. Another annual meeting of local Task Force for Earthquake affectees was organized on 5th November 2006 at Fountain House, Lahore. In 2007, Royal Kingston Rehabilitation Centre was established at Fountain House, Lahore to provide free psycho-social rehabilitation services to the earthquake survivors.

This presentation will address various educational Mental Health activities organized for Earthquake survivors. It will also highlight one year working of Mental health teams at Muzaffarabad and the role of international agencies in combating the aftermath of disaster effect of Earthquake.

PSYCHOSOCIAL PROGRAM IN RECOVERY PHASE

INSTITUTIONS
1. Pakistan Institute of Medical Sciences, Psychiatry, Islamabad, Pakistan

AUTHORS
1. Rizwan Taj¹, Dr.

- On 8th Oct 2005, a Massive earthquake of 7.6 on the Richter scale struck two large portions of mountainous regions of Kashmir and the North West Frontier Province.

- It resulted in to more than 83,000 deaths and 150,000 injuries.

- The lives of 3.5 million people had been affected one way or the other.

- Federal Ministry of Health creates a disaster cell a day after the event at the Pakistan Institute of Medical Sciences in Islamabad.

- The cell is chaired by the Federal minister of Health.

- Provision of Psychosocial support is on top of the agenda.

- An initial survey is carried out and it is decided to constitute mental health teams. Over a six month period over 250 mental health professionals are trained and deployed in the form of teams.

- During this period over 38000 Consultations are provided, the bulk of which are for mood and anxiety disorders.

- In the follow up a plan is being implemented to increase the local capacity building of the health services and creation of posts at different levels.
EARTHQUAKE IN PAKISTAN & KASHMIR: WPA RESPONSE FOR TRAUMA RELIEF WORK

INSTITUTIONS
1. WPA Section on Psychiatry in Developing Countries, United Kingdom

AUTHORS
1. Afzal Javed, Dr.

On the morning of 8th October 2005, Pakistan and Kashmir were hit by a 7.6 Richter earthquake. At 9 am, within 5 seconds, almost all buildings in two major cities: the capital of Pakistani Kashmir, Muzaffarabad and Balakot, a picturesque mountain-city in the North-West, were completely destroyed. It is these 3.3 million people who suffered the most and the massive and severe trauma multiplied personal, social and futuristic effects, in the short and long term.

The situation in Pakistan was in dire need of getting support and assistance for disaster relief. The availability of limited resources and lack of professional expertise in the country were further limitations to the relief work. It is true that disasters may sometimes provide opportunities to develop needed community-based mental health services in under-resourced regions & it was therefore imperative to use available resources to get services in place and also request international community to assist for support.

This paper gives a summary of efforts that were initiated by WPA Section on Psychiatry in Developing Countries with active support of South Asian Forum and many other international organizations in dealing with this national disaster.
LUNDBECK SATELLITE SYMPOSIUM:
SCHIZOPHRENIA MANAGEMENT - FROM RECEPTORS TO LARGE-SCALE PROSPECTIVE TRIALS

INSTITUTIONS
1. Hospital Rodriguez Lafora, Department of Psychiatry, Madrid, Spain

AUTHORS
1. Fernando Cañas¹, Professor, MD

Chairperson: Fernando Cañas

The aim of this symposium is to outline current thinking behind the necessity to evaluate the receptor profiles of antipsychotics as part of the management plan for patients with schizophrenia. A better knowledge of these profiles might allow clinicians to manage switching from one antipsychotic to another more effectively. This switching process is extremely common, but not as well understood as it should be. The symposium will also look at how research into receptor profiles is increasing the understanding of the disorder itself, and contributing to the development of new antipsychotics. Finally, the symposium will see results from the Sertindole Cohort Prospective (SCoP) study - one of the largest post-authorisation studies conducted in schizophrenia research to date which assessed the safety of sertindole treatment under normal conditions of use, as compared to risperidone.

SWITCHING ANTIPSYCHOTICS - THE IMPORTANCE OF PHARMACOLOGIC STRATEGIES

INSTITUTIONS
1. Medical College of Georgia, Department of Psychiatry, Augusta, United States

AUTHORS
1. Peter F Buckley¹, Professor, MD

Many patients with schizophrenia do not find full symptomatic relief from their first antipsychotic therapy. They may even experience adverse events that reduce their quality of life, impact on their physical health, and contribute to the chance of their non-compliance. Recent naturalistic studies have demonstrated that the vast majority of patients will require several switches of medication (1). This strategy is not without risk and, unless the receptor profiles of the current and proposed antipsychotics are considered, patients may experience relapse or adverse events. The receptor-binding profiles of the currently available antipsychotics are now well known. By being familiar with the activity of common antipsychotics in the dopamine, muscarinic, and histaminergic neurotransmitter systems, we should be able to predict likely pitfalls. For example, excessive D₂-receptor blockade can cause EPS and hyperprolactinaemia; yet abrupt removal of this block opens sensitised receptors to excessive stimulation, which can result in withdrawal EPS, or even features of supersensitivity dopamine psychosis. We also need to appreciate that antipsychotics are complex, contributing to a number of different systems and there are likely to be multiple mechanisms working together. By managing switching with receptor profiling in mind, we may be able to minimise the potential for problems during the transition, thereby improving our patients’ best chances of success on the new medication (2).

PRE-CLINICAL PROFILING OF ANTIPSYCHOTICS - EXPECTATIONS OF CLINICAL OUTCOME

INSTITUTIONS
1. H. Lundbeck A/S, Research, Denmark

AUTHORS
1. Jørn Arnt1, Dr, PhD

The impact of second-generation antipsychotics (SGAs) on cognitive deficits in schizophrenia is highly debated, but the general consensus is that the effects of most marketed SGAs are modest (1,2). Most SGAs are antagonists of the dopamine D2-receptor subfamily, 5-HT2A receptors, and of α1-adrenoceptors. Some SGAs, such as clozapine, olanzapine and quetiapine, potently block histamine H1 receptors. Several interact with 5-HT2C receptors, which may confer anxiolytic activity, while others, in particular clozapine and olanzapine, have high affinity for muscarinic receptors. Pre-clinical profiling has a major role in predicting clinical outcomes. A new animal model for pre-clinical evaluation of treatment efficacy for cognitive impairment in schizophrenia uses the NMDA antagonist PCP to induce impairment of executive functions. Subsequent treatment with sertindole reversed this effect, while risperidone, olanzapine and clozapine induced only a weak/non-significant reversal, with haloperidol showing no effect (3). Sertindole’s high selectivity for limbic dopaminergic neurones, high affinity for 5-HT6 receptors, and low affinity for histamine H1 and muscarinic receptors suggests that the drug has negligible potential to cause sedation and cognitive impairment. Rather, sertindole may improve cognitive function. Optimisation of the receptor profiles of forthcoming SGAs is also likely to include glutamate modulators - since no SGAs have direct effects on glutamate receptors.

THE SERTINDOLE COHORT PROSPECTIVE STUDY - RESULTS FROM A LARGE-SCALE TRIAL

INSTITUTIONS
1. CHU de Bordeaux, Department of Pharmacology, Bordeaux, France

AUTHORS
1. Nicholas Moore1, Professor, MD PhD FRCP FISPE

The Sertindole Cohort Prospective (SCoP) study was a prospective, randomised, partially blinded, active controlled, multinational trial designed to assess the safety of sertindole treatment under normal conditions of use (1). The widely-used antipsychotic risperidone, which is not generally associated with major safety concerns, was chosen as comparator. Amongst other reasons, sertindole and risperidone have a number of comparable features (e.g., pharmacodynamic properties and adverse-event profiles) (2), which make it the most suitable comparator for this study. Patients were initially randomised to either sertindole or risperidone monotherapy in a 1:1 ratio. Regardless of whether they remained on randomised treatment, patients were followed up until the end of the study. Primary endpoints were all-cause mortality and hospitalisation with cardiac arrhythmia. Secondary endpoints included cause-specific fatal events, hospitalisations, suicide attempts and treatment duration. It was calculated that 3,800 person years of exposure were needed in each treatment arm to obtain a power of 80%, making SCoP one of the largest post-authorisation studies conducted in schizophrenia research to date. On the basis of data from the second interim analysis, which indicated that continuation of the study was unlikely to provide significant additional information with regard to the primary endpoint, the CHMP agreed to stop the study in September 2007. Results are in the process of being finalised and are expected to be published in late 2008.

Sleep is essential for our physical and mental well being; yet surprisingly little is known about how and why we sleep. However, several studies have linked disrupted sleep to impairment of daytime function. The translation of poor sleep during the night into daytime performance is still poorly understood and no drug has yet been able to address this hallmark. In this symposium we review how melatonergic drugs act and why they may improve the treatment of both primary and secondary insomnia by taking into consideration the daytime consequences of disrupted sleep.

THE COST AND CONSEQUENCES OF INSOMNIA

INSTITUTIONS
1. King’s College London, Institute of Psychiatry, London, United Kingdom

AUTHORS
1. Malcolm Lader¹, Prof, MD, PhD, DSci, m.lader@iop.kcl.ac.uk

The prevalence of sleep disturbances in the population is accepted as about 30%. The clinical consequences of insomnia are severe: patients with insomnia have increased health utilization requirements, coupled with functional impairments and a poor quality of life. High rates of absenteeism from work, accidents and poor work performance may also be among the consequences. Treatment can be symptomatic, as with the benzodiazepine hypnotics, but is associated with unwanted effects, such as day-time drowsiness, and long term dependence. An alternative, currently being explored, is to target the underlying impairments of sleep mechanisms, using physiological agents and procedures.
MELATONIN IN SLEEP-WAKE REGULATION

INSTITUTIONS
1. University of Surrey, Surrey Sleep Research Centre, Guildford, United Kingdom

AUTHORS
1. Derk-Jan Dijk¹, Prof, PhD, d.j.dijk@surrey.ac.uk

The hormone melatonin is intrinsic to the control of rhythmic circadian activity in the brain, and is released from the pineal gland during the night. The delicate interplay between melatonin and other neurotransmitters during sleep and wake can be disrupted by several different conditions. Sleep disturbances may be a consequence of disrupted circadian entrainment. Low levels of melatonin in elderly have been linked to insomnia and administration of melatonin to this patient population is believed to be sleep promoting.

CIRCADIN - A NEW TREATMENT PARADIGM

INSTITUTIONS
1. CPC Research, Glasgow, United Kingdom

AUTHORS
1. Alan Wade¹, Dr, MD, alan@edgehill.demon.co.uk

Several studies have indicated a reduced production of melatonin in elderly or depressed patients. Melatonin receptor agonists may therefore represent a novel approach in the therapeutic management of insomnia. Numerous studies with instant release formulations of melatonin have not been able to provide a coherent picture of robust and clinically significant effects on sleep parameters. Circadin, the name given to melatonin with a modified release formulation that mimics the normal circadian variation in plasma levels of melatonin during the night, led to robust improvements in subjective sleep parameters, but not in objective parameters (as measured by EEG analysis) in primary insomniacs under well-controlled conditions. Whether this effect on subjective sleep parameters will translate into an improvement in the quality of life of depressed or other types of patients is still unknown. Given the effects in acute studies, patient populations other than primary insomniacs (with short-term complaints) may experience greater benefits from this type of compound.
Mood disorders are usually more chronic, recurrent and impairing, and are associated with more comorbid psychiatric and non-psychiatric medical illnesses, than previously believed. There is also a high rate of sub-syndromal symptoms and impairment following recovery, with a low proportion of patients actually achieving full remission.

In this symposium, leading researchers and clinicians will discuss the neurobiology of mood disorders and how this may guide treatment choices. They will then move on to focus on the management of severe major depressive disorder. The importance of improving treatment outcome by achieving full symptomatic remission and returning patients’ quality of life to normal will be discussed, describing the interaction between drug efficacy and tolerability, and patient compliance. Finally, the results of clinical trials investigating new approaches to the management of ‘difficult-to-treat’ patients will be interpreted.

The exact neurobiology of mood and anxiety disorders remains to be clarified. The effects of early available antidepressant treatments, such as tri- and tetracyclic compounds, expressed through various neurotransmitter systems led to the assumption of a key role of neurotransmitters, such as serotonin, noradrenaline and dopamine. The monoaminergic hypothesis claims a lack of available neurotransmitters is the neurobiological background of mood and anxiety disorders. While most available treatments target a broad spectrum of such disorders, some conditions (e.g., OCD, PTSD) show a specific response to serotonergic approaches.

New insights into the interaction of various neurotransmitter systems, as well as imaging technologies (e.g., SPECT, PET), have led to much better understanding of the various complex processes involved in the development of mood and anxiety disorders on a neurobiological level. In addition, some genetic factors involved in the control of serotonin systems have recently become implicated in the vulnerability to depression and anxiety disorders.

With the introduction of selective serotonin reuptake inhibitors (SSRIs) in the 1980s and more recently of serotonin-noradrenergic reuptake inhibitors (SNRIs), the treating physician has a broad spectrum of available antidepressant treatments. Combined dopaminergic/noradrenergic approaches, targeting the melatonergic system, or development of highly selective substances (e.g., escitalopram that targets additional allosteric binding sites at the serotonin transporter), further broadens the choice.

Thus, current and future knowledge of the neurobiology of mood and anxiety disorders, as well as the mechanism of action of available antidepressants, may guide the choice of optimal antidepressant treatment for a specific condition or patient.
TREATMENT MODERATORS IN MAJOR DEPRESSIVE DISORDER: THE CASE OF SEVERE DEPRESSION

INSTITUTIONS
1. Harvard Medical School, Boston, United States

AUTHORS
1. George I. Papakostas, Dr

Major depressive disorder shows high rates of comorbidities and mortality, which have a large impact on patients’ quality of life. The discussion of whether a separation between mild to moderate and severe forms of depression is possible, and whether these are separate disorders or part of a continuum, is ongoing. However, the impact of severe depression has profound social and economic consequences, ranging from comorbid complications to reduced quality of life and social and economic status. Severe depression is often associated with a longer duration of the depressive episode and lower remission rates. The diagnosis of severe depression is guided by the use of quantitative metrics, taking into consideration patient functional outcomes.

Successful treatment approaches for severe depression may require multiple medication strategies with various mechanisms of action, integrated with psychosocial treatments. A variety of pharmacological treatment options, from monoamine oxidase inhibitors (MAOIs) and tricyclic antidepressants (TCAs) to selective serotonin reuptake inhibitors (SSRIs) and newer agents (including serotonin-noradrenaline reuptake inhibitors, e.g., venlafaxine; the noradrenaline-dopamine reuptake inhibitor bupropion; and escitalopram, a highly selective SSRI that differs from all other SSRIs by having an additional allosteric mechanism of action at the serotonin transporter) are available. Thus, reviewing the concept of severe depression and the clinical evidence for different approaches to its treatment will help physicians choose medications based on scientific evidence.

COMPLIANCE AND TREATMENT OUTCOME

INSTITUTIONS
1. University Hospital Gasthuisberg, Leuven, Belgium

AUTHORS
1. Koen Demyttenaere, Dr

Treatment outcome in mood disorders can still be improved. Improving the relationship between diagnosis and prescription, and getting patients in full remission, remain two important challenges. Furthermore, moving patients beyond symptomatic remission to normalisation of functioning and quality of life is increasingly recognised as an important outcome variable.

Many factors influence the outcome of a given treatment and inadequate treatment outcomes may be due to suboptimal management of pharmacological treatment (inadequate dosing, inadequate treatment in cases with only partial improvement), or to early treatment discontinuation.

Poor adherence is generally recognised as one of the major unmet needs in the treatment of mood disorders. Patients may take extra doses, skip doses, take ‘drug holidays’, or stop treatment prematurely. Interesting questions are why patients discontinue treatment at the different stages of treatment and how strategies can be developed to improve compliance. While it is often believed that ‘tolerability’ and ‘efficacy’ of a given antidepressant are the main predictors of compliance behaviour, many other (psychological) factors also play an important role (e.g., fear of dependence, fear of personality changes, being out of control).

This will be illustrated with data taken from the escitalopram database: in one meta-analysis, escitalopram demonstrated superior efficacy versus the SSRIs and venlafaxine. The interaction between efficacy, tolerability, quality of life and improved treatment outcome will be illustrated.

BREAKING BOUNDARIES WITH EXISTING TREATMENTS

INSTITUTIONS
1. Riga Stradins University, Department of Psychiatry, Riga, Latvia

AUTHORS
1. Elmars Rancans¹, Dr

Slow onset of action and/or residual symptoms are frequently seen in the treatment of depressed and anxious patients - both are significant reasons for reduced patient compliance.

Various approaches have been described to reach a faster onset of action of pharmacological treatment, or to improve its efficacy. Increasing the dose of a monotherapy treatment, or augmenting an antidepressant with other treatments, such as antipsychotics or lithium, have proven to be successful. However, such strategies are limited by drug labelling or by increasing side effects.

It is, therefore, relevant to consider the medical needs in 'difficult-to-treat' patient populations and review various clinical approaches. As an example, selective serotonin reuptake inhibitors (SSRIs) are recommended as first-line therapy for obsessive-compulsive disorders (OCD). However, the use of serotonin reuptake inhibitors (SRIs) and SSRIs at doses higher than those used in the treatment of depression are frequently necessary to achieve a response in OCD - an approach perceived as common clinical practice. Recently published data from an open-label study by Rabinowitz et al. (2008)¹ suggest that the use of high-dose escitalopram is efficacious and well tolerated in OCD. However, randomised, blinded studies are lacking and are required to confirm the safety and efficacy of such treatment approaches, including whether dose escalation for a particular antidepressant is an effective strategy in initially refractory patients.

Schizophrenia and related psychotic conditions often have a chronic course and require long-term treatment. Among the challenges in the provision of such care non-adherence to treatment ranks high and presents a main reason for a higher frequency of relapses and re-hospitalization.

Barriers to good long-term prognosis
Dieter Naber, University Clinic of Hamburg, Hamburg, Germany

A possible way to address non-adherence is using depot antipsychotics. We will address practical and theoretical issues relevant to the use of depot antipsychotics including safety, efficacy and mode of action. Despite all the advantages of depot formulations (fast transparency of non-compliance, regular therapeutic contact), their use decreased subsequent to the introduction of atypical.

Optimal methods of switching
Tim Lambert, University of Sydney, Camperdown, NSW Australia

Although it was hypothesized that the greater tolerability of atypical antipsychotics might improve adherence as compared with that for typical oral antipsychotics, still approximately 40% of patients with schizophrenia are poorly adherent, with nonadherence tending to increase over time. Thus, a major advance for many schizophrenic patients might be the development of further atypical antipsychotic long-acting injectable formulations.

Will novel atypical depots make a difference?
Antony David, Institute of Psychiatry, King's College, London, UK

Non and significant partial adherence have been associated with poorer functional outcomes including greater risks of psychiatric hospitalizations, poorer mental functioning, reduced life satisfaction, and greater substance use. There is a significant body of evidence supporting the use of long-acting medications in reducing relapse and rehospitalisation rates, thereby increasing beneficial outcomes.

Diagnosing and treating mood and pain disorders entails addressing both psychological and painful physical symptoms. The complexity of and interaction between these symptoms can make the clinician's job, and patient recovery, challenging.

**Chairperson:** Robert Peveler, DPhil, FRCPsych
Professor of Liaison Psychiatry, Mental Health Group, University of Southampton, UK

Diagnosing and treating mood and pain disorders entails addressing both psychological and painful physical symptoms. Whatever therapeutic agent and course of treatment are selected for patients with mood and pain disorders, it is important to regularly monitor and treat all associated symptoms in order for remission to occur.

**The Diagnostic Challenges in Mood Disorders**

Hans-Jürgen Möller, MD, Ludwig-Maximilians-University Munich, Germany

Patients with mood disorders frequently present with complex emotional, painful, and other symptoms, making clinical diagnosis very difficult.

**Symptom Clusters in Mood: Does Pain Have a Role?**

Koen Demyttenaere, MD, PhD, University Hospitals Gasthuisberg, Belgium

Current insights into the symptom cluster of depression and other related mood disorders have helped to reveal a common underlying pathophysiology. These symptom clusters will be explored in depth.

**Tactical Approaches to Achieve Optimal Remission**

Michael Thase, MD, University of Pittsburgh Medical Center, US

Clinicians must use effective strategies and thoroughly evaluate different treatment options to increase their patients’ chances of achieving and sustaining remission.

**PFIZER SATELLITE SYMPOSIUM:**

**THE LONG ROAD: A PATIENT-CENTERED DISCUSSION ON THE CHRONIC MANAGEMENT OF MENTAL ILLNESS**

In this symposium, clinical case scenarios will be discussed by a multidisciplinary panel, including experts from psychiatry, cardiology, endocrinology, and patient advocacy. The experts will consider treatment options and discuss evidence-based decisions for patient care. The case descriptions will offer an opportunity to discuss diagnosis, treatment initiation, and maintenance therapy in a patient population known to have significant cardiovascular and metabolic problems comorbid with mental illness. Mechanisms of action, side effects, guidelines, and management implications of antipsychotic agent choices will be covered. The treatment of somatic illness in people with mental disorders will be addressed. Adherence to treatment regimens, psychosocial therapies, rehabilitation, and supportive community living will be discussed. The importance of coordinating psychiatric care with other health care practitioners in the chronic management of patients with schizophrenia or bipolar disorder will be highlighted. Patient and caregiver education, particularly education on modifiable cardiovascular and metabolic risk factors, will be discussed. In addition, the panel will address the importance of improving access to care for somatic health care needs in patients with schizophrenia and bipolar disorder.
THE JOURNEY FOR THE PATIENT WITH BIPOLAR DISORDER: PRESENTATION, DIAGNOSIS, AND TREATMENT

Eduard Vieta, MD, PhD

Bipolar disorder is a debilitating and clinically heterogeneous condition. Although significant advances have been made in its diagnosis and treatment in recent years, it remains underdiagnosed and inappropriately treated. Bipolar disorder is associated with a high rate of mortality and morbidity compared with the general population. Studies investigating the physical health of this patient population suggest an increase in medical comorbidities and an increased risk for cardiovascular and metabolic disease. Comorbidity in bipolar disorder is associated with poor treatment outcomes, including an increase in suicide risk, decrease in remission, and poor functional recovery. The rate of nonadherence to treatment is high in bipolar disorder, and there is an increased risk of relapse in patients who are inadequately treated. The treatment plan for bipolar disorder requires consideration of a variety of factors, including primary diagnosis, presence of comorbidities, prior treatment response, and patient preference. Bipolar disorder is treated with a wide range of psychoactive drugs; most recently, second-generation atypical antipsychotics have demonstrated efficacy in this disease. Recent data suggest that patient and caregiver psychoeducation intervention is a valuable treatment adjunct associated with a reduced risk of recurrences. These findings highlight the importance of considering long-term treatment goals, as well as balancing the effectiveness of treatment options in the chronic management of patients with bipolar disorder. The clinical case history of a patient with bipolar disorder and considerations for long-term treatment will be discussed.

THE JOURNEY FOR THE PATIENT WITH SCHIZOPHRENIA: PRESENTATION, DIAGNOSIS, AND TREATMENT

Fernando Cañas, MD

Significant advances have been made in the treatment of the schizophrenia, including an improved understanding of the patient population through large-scale naturalistic studies, the introduction of second-generation antipsychotics, advancement in psychosocial interventions, and an increased awareness of treatment response. Schizophrenia is associated with a high rate of mortality and morbidity compared with the general population. The mortality rate is 1.6 to 3 times higher than the general population, and these patients are more likely to have thyroid abnormalities, COPD, hepatitis B and C, fluid and electrolyte disorders, HIV infection, tuberculosis, and other diseases. Emerging data from several large-scale studies demonstrate an increase in the risk for cardiovascular and metabolic disease in this patient population. Patients with schizophrenia have an increased rate of modifiable risk factors, such as alcohol and drug abuse, cigarette smoking, hypertension, obesity, poor diet, and sedentary lifestyle. Antipsychotics have been associated with varying levels of cardiometabolic side effects. Adherence to treatment regimens and overall health care for comorbid medical conditions are less than optimal in this patient population. Relapse rates are high due to poor adherence, and switching among antipsychotic medications is common. These findings highlight the importance of considering long-term treatment goals, as well as balancing the efficacy and safety of treatment options in the chronic management of patients with schizophrenia. The clinical case history of a patient who presents with schizophrenia and cardiovascular and metabolic risk factors, as well as the short- and long-term treatment plan, will be discussed.
Addressing the general health needs and coordination of care with other members of the health care team, the patient, and the carer are critical in the chronic management of bipolar disorder and schizophrenia. The prevalence of modifiable risk factors for cardiovascular disease in patients with bipolar disorder and schizophrenia is high, including obesity, smoking, diabetes, hypertension, and dyslipidemia. Given the prevalence of medical comorbidities in mental illness, considering the safety and tolerability profiles of treatment options is essential. The panel will consider treatment choices in the initiation of therapy and issues for optimizing long-term follow-up care in bipolar disease and schizophrenia. The effectiveness of several antipsychotics and their variable cardiometabolic effects have been demonstrated in real-world studies and randomized clinical trials. The second-generation antipsychotics’ effects on weight gain, dyslipidemia, and insulin resistance vary considerably. Some antipsychotics and antidepressants have shown a modest, prolonged QTc interval. However, QTc prolongation has not been consistently linked to clinical outcomes (e.g., syncope, torsades de pointes, ventricular arrhythmias, and sudden death). The ADA/APA consensus conference on antipsychotic drugs, obesity, and diabetes recommends considering the metabolic side-effect profile associated with the antipsychotic agent, baseline screening, and a monitoring protocol for patients treated with second-generation antipsychotics. In addition to efficacy, consideration of the safety and tolerability profiles in the long-term treatment options for patients who have significant cardiovascular and metabolic risk factors is key. Issues for optimizing follow-up care in a patient who has modifiable cardiovascular and metabolic risk factors will be discussed. Opportunities for improving adherence, convenience of treatment, improved quality of life, patient and caregiver education, and community support will be discussed.

2. Christine E. Ryan MD, Ph.D, cryan@lifespan.org
3. Ivan Miller Dr., Ph.D, imiller@butler.org

Objective: The effectiveness of psychopharmacologic and psychotherapeutic treatment for patients with major depression and bipolar disorders is limited. Family therapy may be a useful adjunct for the treatment of these patients.

Method: Data on adjunctive family therapy to pharmacotherapy for patients with major depression and bipolar disorders will be presented. In the first study, seventy-six patients hospitalized for depression were randomly assigned to one of four treatment conditions on discharge. These included pharmacotherapy alone, combined pharmacotherapy cognitive therapy, and family therapy. Randomly assigned treatment continued for 24 weeks on an outpatient basis. In the second study, ninety-two patients diagnosed with bipolar I disorder were randomly assigned to receive pharmacology alone, family therapy plus pharmacotherapy or multifamily psychoeducational group and pharmacotherapy. Treatments and assessments continued for up to twenty-eight months.

Results: For major depression, treatment that included a family therapy component led to a greater proportion of patients who improved and to significant reductions in interviewers rated depression and suicidal ideation in contrast to treatment without family therapy. For bipolar disorders, the addition of a family intervention did not improve outcome. However, in patients from families with high levels of impairment (in contrast to those with low impairment), the addition of a family intervention resulted in a significantly improved course of illness. Also, patients who received family interventions had a reduced rate of hospitalization on relapse.

Conclusions: Family interventions are a useful adjunct in the treatment of patients with mood disorders.
MIGRATION, ACCULTURATION PROCESS AND CHANGES IN THE FAMILY STRUCTURE

INSTITUTIONS
1. Orient Medical and Rehabilitation Centre, Director, of Orient Medical and Rehabilitation Centre, Stockholm, Sweden

AUTHORS
1. Riyadh Al-Baldawi, Dr., MD, Ph.D, r.baldawi@orienthalson.nu

Migration puts individuals and families in front of a number of challenges. The home countries socio-cultural collective way of living influences and regulates the family’s internal and external relations. Migration from such a country into a new country, with an individually oriented socio-cultural system turns the adaptation and integration of the immigrants into a complicated process. The challenges that the immigrants face differ depending on a number of factors such as the family’s socioeconomic background, the parents’ level of education, the standard of living in their home country as well the level of involvement in the new society. These factors and many others influence the way the family structure changes with time and in which way the family members relate to each other in their internal and external relations. This presentation is based on an analysis of 32 families from the Middle East who have come to Sweden as refugees. These families used to live according to a patriarchal structure in their home country. These 32 families were observed during a three year period and we followed their way of living in the new society and the kind of changes that occurred in the family relation and structure. The families practiced and developed three types of structures in the new country; traditional, integrated and assimilated. This presentation briefly discusses the factors that played a certain role on the changes in the family structure and the consequences of these changes on the family member’s psychosocial health and relations.

A CONTROLLED TRAIL COMPARING BRIEF PSYCHODYNAMIC THERAPY TO FAMILY THERAPY FOR CHILDHOOD DEPRESSION

INSTITUTIONS
1. Eginition Hospital, University of Athens Department of Psychiatry, Athens, Greece
2. West Midlands NIMHE/CSIP Child Mental Health, London, United Kingdom

2. J. Trowell, Dr., MD
3. F. Almqvist, Dr., MD, Ph.D

Provided the scarcity of research investigating the efficacy/effectiveness of psychotherapy for childhood and adolescents depression, a multi-centre, randomized controlled trial was carried out for this purpose. Seventy two depressed children and adolescence, aged 9-15 years, residing in London, Athens, and Helsinki were allocated to two forms of psychotherapy: Individual Psychodynamic Brief Therapy and Systemic Integrative Family Therapy Assessment took place at baseline, end of therapy and a 6-month follow-up. The clinical outcome of the therapeutic interventions has already been reported (Trowell et al 2007). The comparative psychosocial outcome of the two treatments will be presented. Scales assessing overall social adjustment, social, school, peer and family adjustment rated by the child, parent, external rater and teacher were used as measures of psychosocial outcome.

In general, both types of treatment were equally efficacious in improving the adjustment and social functioning of depressed subjects.
EMPOWERMENT-BASED PRACTICES WITH FAMILIES OF PEOPLE WITH SCHIZOPHRENIA

INSTITUTIONS
1. Sao Paulo Federal University, Psychiatry, Sao Paulo, Brazil

AUTHORS
1. Cecilia C. Villares¹, Dr., MD, cvillares@terra.com.br
2. Elaine Vieira¹, Dr., MD

Families of people with schizophrenia worldwide are burdened with many aspects of care demanded by their ill relatives. In Brazil, people with severe mental illness usually live with their families, and family psychoeducation has become a more widespread practice as psychiatric treatment moved towards community-based services in the last decade.

This presentation aims at describing a 10-year experience with multi-family intervention groups carried at the Schizophrenia Program of Sao Paulo Federal University. Through analysis of the main themes and questions, and written evaluation sheets filled by the participants at the end of the 10-week intervention in selected years, we wish to discuss the following:

1- Cultural changes resulting from a much wider access to information have affected how participants name the illness and formulate questions, with medical terminology much more present in their narratives nowadays. However, participants bring the same questions as ten years ago, specifically in issues related to the difficulties of living with someone with schizophrenia. It seems that endurance of life problems posed by the illness, in spite of information/education available points at lack of larger social support strategies and to the disempowerment brought by the illness experience.

2- The design of our intervention program favours dialogue, reflection, appreciation of differences, and skills development. Final evaluation forms consistently show that empathy, hope and empowerment are among the main gains of taking part of the program. We propose that these may indicate that a recovery-oriented approach can be a powerful tool for helping people regain agency over suffering.

THE NETWORK MIND IN FAMILY RESEARCH AND FAMILY INTERVENTION

INSTITUTIONS
1. Saint John Hospital, Psychiatry, Budapest, Hungary

AUTHORS
1. Tamas Kurimay¹, Dr., MD, Ph.D, tinesitoncsi@hotmail.com

In the presentation I will explore recent developments in biology, social sciences and human relations that help to make sense of the quality of network relationships. 'By demonstrating that the Web, the cell, or society is driven by similar organising principles, network theory offers a successful conceptual framework to approach the structure of many complex systems.' (Barabási, 2005.)

The concept of ‘strong ties’ and ‘weak ties’ provides a template to work with the complexities of family life, wider contexts, and the nature of the therapeutic relationship.

Marc Granovetter introduced the concept of “weak ties” into the field of social sciences. Later this concept is revealed as a general rule in the different complex systems and networks. (Csárdi, G. P., 2004)

I suppose that in the context of psychotherapy, including family interventions and family therapy, the therapist must behave as a ‘weak tie’. This is a basic role of any therapists for the therapeutic encounter to avoid becoming abusive. (Kurimay, Jenkins 2007)

In family history, getting to know about our far relatives, our family myth and legends all belongs to the “weak tie” spectrum of the family system.

Building on the early network ideas of Speck and Attnave (1972) and colleagues, I will delineate a new model for reasearch, theory and practice.

PSYCHOTHERAPY EAST AND WEST: PARADIGMS AND PARALLELS
Allan Tasman, M.D.

Both Eastern and Western cultures have long and rich histories of scholarship which address the basic nature of man and of mental processes and functions. This body of thought has been accompanied by attempts to understand psychological and interpersonal approaches to the alleviation of emotional suffering. To a great extent, the nature of the approaches reflects the cultural milieu in which they were developed. Western societies have historically, and still at present, emphasize the role of the autonomously functioning individual. The focus of the psychoanalytic approaches developed by Freud and others at the start of the 20th century use as a framework for understanding mental processes the struggles of the individual in reconciling biological urges with social constraints and personal moral values. To some degree, all modern Western psychotherapeutic methods, including cognitive, behavioral, and interpersonal therapies, were developed within this framework. Eastern cultures, with a greater emphasis on the individual as a member of a family unit and a larger social unit, have developed different frameworks for understanding and intervention. Over the last 30 years, however, with a growth in understanding of Eastern philosophies and cultures in the West, new perspectives have begun to emerge. This presentation reviews the historical antecedents to presently used psychotherapeutic approaches, and discusses how future gains in both our understanding and in our approaches to treatment will benefit from increased interaction of Eastern and Western perspectives.

SPIRITUAL PERSPECTIVES IN TAO PSYCHOTHERAPY AND WESTERN PSYCHOTHERAPY
Chan Hee Huh, M.D.

The author will present a spiritual perspective of Tao Psychotherapy, a synthesis of Eastern Tao and Western psychotherapy developed by Professor Rhee Dongshick, from Seoul, Korea. Although embracing the basic principles of Western psychotherapies including psychoanalysis, object relations, self psychology, daseinsanalytic and existential psychotherapies, Tao Psychotherapy grounds both its underlying philosophy and its clinical practice in the principles and perspectives of Eastern thought including Confucianism, Buddhism, and contemplative Taoism. The author will offer a comparative overview of Tao Psychotherapy and Western Psychotherapy in terms of spiritual perspective with the ten ox pictures which refers to ancient pictorial metaphors illustrating the ten stages of awareness the person goes through to achieve purification of mind. Thus, Tao Psychotherapy meets Western psychotherapy at the ontological, theoretical and practice levels. This dialogue will develop further, leading to the enrichment of each approach to psychotherapy.

CONFLUENCES IN EASTERN, EXISTENTIAL, AND PSYCHOANALYTIC THOUGHT
Erik Craig, Ed.D.

This paper explicates fundamental confluences found in psychoanalytic, existential, and Eastern psychotherapies. Beginning with a depth psychological definition of psychotherapy as such, the paper goes on to explicate common philosophical/ontological grounds for thinking about all forms of depth oriented psychotherapies. In particular, the paper addresses such fundamental common principles as the problem of suffering, the possibility of virtue, the primacy of lived-experience, and the penchant for flight. Following this philosophical analysis, taking classical psychoanalysis, Daseinsanalysis, and Taopsychotherapy as exemplary forms of each of the three great traditions (psychoanalytic, existential, Eastern) in depth psychotherapy, the paper will show how awareness of a few common therapeutic principles might inform and enrich the everyday practice of psychotherapy. In particular, the therapeutic sanctuary, the therapeutic relationship (including eros and compassion), and, finally, the therapeutic attitude (radical openness, permissiveness, or letting be in the West or, in the East, wu wei), are discussed and illustrated. Finally, these classical fundamental principles and practices are discussed with reference to contemporary trends in various modern schools of psychoanalytic psychotherapy.

TAOPSICUThERAPY AND ASSIMILATION OF WESTERN PSYCHOTHERAPY IN ASIA
Suk-Hun Kang, M.D.

With my primary emphasis on experiential practice, rather than theoretical or technical problems, the author will present my paper. The paper is roughly composed of two parts; In the first part, the author will critically examine some of the assimilation processes of Freudian psychoanalysis and Western psychotherapy in the early and mid-twentieth centuries since their introduction to Asia, particularly in India, Japan and Korea, And then in relation with the above assimilation process, there will follow a brief description of the evolution process of Taopsychotherapy, advocated by Prof. Rhee,¹ D. Finally, the author will clarify some key notes concerning Taopsychotherapy, for example, “nuclear feelings”, “perfect empathy” and Bodhisattva’s compassion, emphasizing their significance for both East and West psychotherapies.

With the description of the first risk genes for schizophrenia like Neuregulin-1 or G72, the realistic hope arose to have more insight into the pathophysiology of psychoses. Some facets of this search are that there is an overlap between risk genes in different psychotic disorders like schizophrenia and bipolar disorders. Furthermore, by now it seems to be relatively clear that the risk and/or candidate genes need to be classified into different subgroups of action, e.g. being involved into the development of the illness, influencing the response to treatment and/or course or being simply modifier genes, which are unrelated to the illness but import for mental functions in general.

Therefore this symposium is trying to address two key issues:
1. What are relevant genetic and non-genetic factors contributing to the risk to develop schizophrenia and autism?
2. Is there an overlap between the molecular basis of schizophrenia and autism supporting the notion the both disorders have a neurodevelopmental component looking at their etiology.

CULTURAL PSYCHIATRY IN SIBERIA

INSTITUTIONS
1. Mental Health Research Institute, Borderline States Department, Tomsk, Russian Federation

AUTHORS
1. Valentin Ya. Semke1, Prof., MD, niipz@sibmail.com

Cultural psychiatry acquires distinct contours and opens new prospects. Cross-cultural analysis allows sharpening the assessment of mental disorders and addictive behavior in the groups of urbanized and remote from civilization population belonging to various cultures and races, living in different climate-geographical regions, under conditions of instable life and psychological distress. It is especially correctly in region of Siberia where 26 different nationalities live. In this symposium, various pathology of mental health is considered through prism of theoretic, clinical, biological aspects of cultural psychiatry.
THEORETIC METHODOLOGICAL APPROACHES TO TRANSCULTURAL INVESTIGATIONS

INSTITUTIONS
1. Mental Health Research Institute, Borderline States Department, Tomsk, Russian Federation

AUTHORS
1. Valentin Ya. Semke¹, Prof., MD, niipz@sibmail.com

Comparison of transcultural methods and approaches in the field of general personology and psychotherapy results in establishing closeness of positions studying healthy and ill personality, defining borders of norm and pathology, assessing personality structure with account for concrete trial data, approaching interpersonal and intrapersonal aspects, improving communication methods, analyzing conscious and unconscious mechanisms, using archetypal and modernist methodology. Social-psychologically, efforts of two contemporary cultures should be directed at assimilation of knowledge for forming an individual of future.

We are developing a Eurasian project of approaching ethnopsychological and ethnotherapeutic positions of West and East: in practice, the question is search for ways of synthesis of used by every considered culture methods to remove human ailments, psychological dependences, to overcome interpersonal and intrapersonal conflicts.

PECULIARITIES OF FORMATION OF DRUG ADDICTIONS IN ADOLESCENT SUBPOPULATION OF MIGRANTS IN FAR NORTH

INSTITUTIONS
1. Mental Health Research Institute, Addictive States Department, Tomsk, Russian Federation

AUTHORS
1. Nikolay A. Bokhan¹, Prof., niipz@sibmail.com

Formation of drug addictions in Far North (FN) was studied in adolescent subpopulation (490 persons of both sexes at the age 15-18 years). Opioid dependence syndrome has been studied in 64 adolescents from one of the cities of Yamal-Nenets Autonomous District. Sixty adolescents with F11.3 from Tomsk have constituted control.

Steadiy high level of prevalence of alcohol and drug dependence among adolescent subpopulation has been revealed associated with increase of number of persons infected with hepatitis B,C (85,9%), and HIV (40,6%). Involvement of adolescents into addictive behavior constitutes 33% at the age 15-16 years and abruptly increases up to 61,9% at the age 17-18 years. Association of social-psychological risk factors of involvement of adolescents into addictive behavior under conditions of FN has been identified with: heteroaggressive (65,5%), autoaggressive (40,2%) and delinquent (35,6%) behavior; dysfunctional parental families (incomplete family (49,4%), low social status of parents (69,5%), paternal alcoholization (54%).

Clinical dynamic of opioid dependence syndrome is characterized by: high level of use of many drugs (combination with dependence on cannabinoids in 96,9% of cases (control 32,1%), with dependence on alcohol in 61% of cases (control 47,4%), with dependence on hypnotics - in 14,1% of cases (control 7,4%)); high level of comorbidity with personality disorders (84,4%, control 43,7%) in kind of dissoical (23,4%), hysteric (21,9%), dependent (20,3%) and emotionally labile (18,8%) disorder as well as high comorbidity with suicidal behavior (15,6%, control 4,2%, P<0,05) and prolonged course of post-withdrawal (affective, dissonnic) disorders (upon the average up to 17,4±3,3 days during 13,6±3,4 in control).
MENTAL HEALTH OF SCHOOLCHILDREN OF SIBERIA: TRANSCULTURAL COMPARISONS

INSTITUTIONS
1. Mental Health Research Institute, Preventive Psychiatry Department, Tomsk, Russian Federation

AUTHORS
1. Irina E. Kupriyanova¹, Dr., MD, niipz@sibmail.com
2. Bairma A. Dashiyeva¹, Mrs., niipz@sibmail.com

Objective of present investigation is to study borderline neuro-mental disorders in Buryats and Russians, rural schoolchildren. 259 persons of Buryat nationality and 153 persons of Russian nationality were examined (mean age of Buryats has constituted 12.3±0.34, Russians 11.8±0.28 years) studying at rural secondary schools of Republic Buryatiya and Tomsk District. Analyzing structure of groups of mental health it is possible to say that the greatest specific weight in Buryats is possessed by group of mentally healthy persons (56.8%), the second place is occupied by clinical forms of borderline neuro-mental disorders (30.1%). In Russian schoolchildren the first place is occupied by persons with clinical forms of neuro-mental disorders (45.1%), the second place – mentally healthy schoolchildren (36.6%). Based on results of clinical investigation and analysis of signs exerting impact on mental health of children, prognostic program was created taking into account influence of ethnocultural factors. Juniors-Buryats have a high degree of risk for development of school disadaptation. Causes are low general knowledge, informational isolation, and absence of pre-school preparation and stimulation of developments of preconditions for successful learning, necessity of broadening the knowledge of Russian language. High prevalence of accompanying somatic pathology in Russian children (90.1%) is a risk factor for origin of neuro-mental disorders. Enhancement of indices of prevalence of borderline NMD is associated with change of social-economic conditions between village and city destabilizes system of family in Russian population. Maintaining traditional life style is a protective factor in Buryat population.

ETHNOCULTURAL ASPECTS OF ADAPTATION OF SCHIZOPHRENIC PATIENTS

INSTITUTIONS
1. Mental Health Research Institute, Endogenous Disorders Department, Tomsk, Russian Federation

AUTHORS
1. Arkady V. Semke¹, Prof., MD, niipz@sibmail.com
2. Lubov D. Rakhmazova¹, Dr., MD, niipz@sibmail.com

Among clinical preconditions of adaptation of schizophrenic patients of significance are positive psychopathological disorders, negative manifestations as well as provoking, accelerating and worsening course of the disease factors. Degree of adaptive value of positive disorders depends on their rank predominating in the course of disease or character of “persistence”. In populations of Turkic language peoples of Siberia, significantly more cases with affectively saturated acute delusional symptoms, archaic, “Manichean” story of experiences are revealed what reflects on dynamic of disease. Adaptive value of negative disorders is associated with rank, domain of impairment, ratio of quantitative-qualitative structure what may be called endogenous transformation of personality on what peculiarities of positive disorders in exacerbations and remissions, adaptive reactions and types of individual compensator-adjustment defense depend. Structure of deficit disturbances differs very much in “Slavic” and “mongoloid” populations. Combination of different in character, depth and domain of impairment of negative disorders in remissions creates a new personality structure and is a ground identifying: content, degree of severity and periodicity of positive psychopathologic disorders in remissions; degree of liability to decompensating influences with possible clinical consequences; character of secondary compensator formations (short-term adaptive reactions and more stable formations - basic types of compensator-adjustment defense). This new life stereotype of the patient and finely quality and level of social adjustment are summed depending on individual adaptive possibilities and totality of social conditions, i.e. internal and external preconditions. Cultural-environmental differences play in their formation an essential value.
TRANSCULTURAL INVESTIGATIONS: BIOLOGICAL AND CLINICAL ASPECTS OF MENTAL HEALTH IN NORTH

INSTITUTIONS
1. Mental Health Research Institute, Pathophysiology Department, Tomsk, Russian Federation

AUTHORS
1. Tamara V. Shushpanova¹, Mrs., PhD, niipz@sibmail.com
2. Valentina F. Lebedeva¹, Dr., MD, niipz@sibmail.com

In conducted by us many-year investigations in the general health care some clinical and therapeutic peculiarities of mental disorders have been revealed in patients of Tatar nationality as compared with Russians. With account for the national sign number of Tatars among 932 patients with revealed mental disorder under conditions of general health care has constituted 4.1% (n = 38). We have studied 65% of men and 35% of women, whereas among the Russians number according to nosology.

In persons of Tatar nationality personality disorders (28.9%), neurotic, stress related and somatoform disorders (26.3%), organic mental disorders (21.1%) predominated then in decreasing order affective disorders (15.8%) and schizophrenia followed (7.9%). Among patients of Russian nationality organic mental disorders (36.9%), neurotic stress-related and somatoform disorder (20.8%), affective mood disorders dominated (11.8%), personality disorders have been documented in 4.0% of cases.

It should be mentioned that men were oftener diagnosed with personality disorders (23.6%) and organic mental disorders (15.8%), in women of predominance were neurotic, stress-related and somatoform disorders (15.8%) and affective mood disorders (10.5%). Among neurotic, stress-related and somatoform disorders in patients obsessive-phobic disorders dominated (67%). Thus patients of the given group sought help in average in a year after occurrence of psychopathological disorders.

CHILD PSYCHIATRY TRAINING PROGRAMME (FOR DEVELOPING COUNTRIES)

INSTITUTIONS
1. Dr. Balabhai Nanavati Hospital, Department of Psychiatry, Mumbai, India
2. Vidyasagar Institute of Mental Health & Neurosciences, Department of Child & Adolescent Psychiatry, New Delhi, India

AUTHORS
1. Priyvadan Chandrakant Shastri¹, Dr., MPD, DPM, pcs910@hotmail.com
2. Jitendra Nagpal², Dr., MD, DNB, jitendranagpal@rediffmail.com

Aims and objectives:
A large number of developing countries do not have training in child psychiatry at undergraduate and postgraduate level. Present programme envisages hands on skill training for practicing consultants in developing countries. A week long programme will cover topics like school mental health clinic, autism and learning disabilities. A multidisciplinary team approach with case demonstration right from history taking, examination and treatment management and therapy will be part of skilled training programme. Following topics will be covered. School mental health clinic, autism and learning disabilities. Visit to institutions catering to the topic discussed and demonstrative will be done on the same day. Training programme will be conducted at specialized clinics of the topic of the day. Mumbai and Delhi have these specialized clinics and expertise to teach and train where training will be carried out. We propose to have this programme once in a year with 6 to 8 trainees. Trainees can be sponsored from member developing countries.
Further to the WPA position paper on Physician Impairment, the Executive created a Task Force on Physician Health and Well-Being to guide the efforts of the WPA in supporting the well-being of its members as well as physicians at large. This symposium will update the attendants about complementary issues as well as recent research.

OBJECTIVES:
To present an overview of the Task Force advocacy recommendations
To present an update of recent research data

THE WPA TASK FORCE ON PHYSICIAN HEALTH: FROM IMPAIRMENT TO HEALTH AND WELL-BEING

INSTITUTIONS
1. University of Calgary, Dept of Psychiatry, Calgary, Canada

AUTHORS
1. Nady A el-Guebaly, Dr., MD, nady.el-guebaly@calgaryhealthregion.ca

Further to the WPA approval of a position paper on the practice issues surrounding "Physician Impairment with mental illness and addictions" in 2003 and at its annual meeting in Cairo, the Executive decided to establish a Task Force on Physician Health and Well-Being to further an agenda at the WPA-annual meeting in Prague. This presentation summarizes some of the Task Force's deliberations to date.

1. The implications of a focus on "Impairment" versus "Burn-out". The pros and cons of a strategy supporting colleagues with their health problems regardless of the cause versus focus on occupational stressors will be reviewed.

2. A refocus from a disease orientation to health promotion strategies. Along with the shift observed in the delivery of health care in most developed countries, strategies in support of the medical workforce are increasingly promoting positive "wellness" strategies. A North American thematic survey identified five categories of such practices, i.e., relationships, spirituality, self-care, work and approaches to life. Potential implications for the broader global context will be outlined.

3. The optimal scope of physician health issues The field of physician health is rapidly expanding including new "disruptive behavior", retirement issues, etc. The implications of the appropriate scope of advocacy by the WPA will conclude the presentation.
GENDERED ASPECTS OF PHYSICIAN STRESS

INSTITUTIONS
1. Women's Health Program, Toronto, Canada

AUTHORS
1. Donna Stewart¹, Dr, MD, Dr.Donna.Stewart@uhn.on.ca

The stress of practicing medicine has received increasing attention but its differential impact by gender has not. This presentation will review recent literature on gender aspects of physician stress as well as present some of our recent research findings on gendered aspects of stress in academic physicians.

Our work will show that there are different patterns of cortisol secretion elevations in men and women academic physicians which may be explained by different patterns of work and family stress. The overall implications of these gender differences will be discussed and potential solutions presented.

Objectives:
1. Participants will understand some common stress factors in male and female physicians.
2. Participants will understand the different effects of stress on male and female physicians.
3. Participants will appreciate some physiological changes in male and female physicians under stress and possible causes of these differences.

BURNOUT SYNDROME - FREquent BUT NEGLECTED SYNDROME OF GENERAL PRACTITIONERS

INSTITUTIONS
1. Institute of Mental Health, Belgrade, Serbia and Montenegro

AUTHORS
1. Dusica Lecic Tosevski¹, Dr, MD, dusica.lecitosevski@eunet.yu

Burnout syndrome seems to be widespread among health care professionals. However, it although highly prevalent is often neglected. In addition to that, it is seldom assessed in countries which were exposed to stressors of high intensity, such as war conflicts and social transition.

Objective - The objective of this study was to compare burnout syndrome of general practitioners in three countries - two countries that have experienced war and social transition (Bosnia and Serbia), and in developed and peaceful country (Norway).

Methods - The sample consisted of 111 general practitioners from three different cities (31 from Sarajevo, 41 from Oslo and 39 from Belgrade). Maslach Burnout Inventory, measuring three dimensions of exhaustion, depersonalization and inefficacy was administered during training seminars on mental health in primary care.

Results - The highest burnout scores were registered in Belgrade sample, followed by Sarajevo and Oslo general practitioners. The emotional exhaustion was higher in female than male doctors and depended on daily number of patients.

Conclusions - Burnout affects personal well-being and professional performance. Therefore it is important to undertake preventive measures against its development, such as strategies focused on individual and organization. Stress management might be one these measures.
MODERN PROFESSIONALISM AS RISK FACTOR FOR WRONGDOING

INSTITUTIONS
1. Queen’s University, Dept of Psychiatry, Kingston, Canada

AUTHORS
1. Julio Arboleda-Florez, Dr., MD, julio.arboleda-florez@queensu.ca

The complexities of the professional exercise of Medicine are best exemplified by the reference to physicians and hospitals as part of the "health industry." In some modern medical practices the patient is lost as a simple clog of a mechanism of evaluation whereby he is expected to go through a number of other professionals and a multitude of biological and imaging tests in a maze that has to be negotiated before finally coming to see the physician for just a few minutes. The medical encounter is often-times a euphemism as it has become a simple, perfunctory exchange of a few words and the handling of a prescription. The person behind the labeled "patient" is nowhere to be reckoned with. Under these circumstances mistakes are more likely to happen and the impersonal atmosphere adds to the distancing of the physician from the patient thus increasing the possibilities of transgressions either purposely planned or as a result of inadvertently sliding into wrongdoing. When this happens social control measures are invoked. This presentation will expand on the nature of these measures and the impacts they have on those caught in their mesh, both physicians and patients alike.

OBJECTIVES:
1. Become familiar with definitions of professionalism
2. Learn trends on where Medicine is going to as a profession
3. Identify pathways to wrongdoing

HELPING SICK DOCTORS: THE UK EXPERIENCE

INSTITUTIONS
1. St. George’s University of London, London, United Kingdom

AUTHORS
1. Mohammed T Abou-Saleh, Dr., MD, mabousal@sghms.ac.uk

The British Medical Association has estimated that 1 in 15 doctors may be suffering from alcohol or drug problems. However the majority of sick doctors do not access national health services for reasons of stigma and concerns about confidentiality. This has necessitated the development and provision of voluntary health and counseling services by medical charities and professional bodies. The have many examples of good practice of confidential often doctor-to-doctor services.

The other important facet is the role of the General Medical Council (GMC) - the governing body of the medical profession in the UK in Supporting Doctors and Protecting Patients. Data from the GMC showed that the absolute majority of doctors under supervision have substance misuse and mental health problem.

The author will focus and reflect on the role of the GMC: Whilst it prioritizes the safety of patients, the GMC also supports doctors in providing necessary supervision and monitoring to enable them to restore their health and fitness to practice.

OBJECTIVES:
To critically review the role of the British General Medical Council experience of helping the impaired doctor
To contrast the British with the European and the US procedures

NON PHARMACOLOGICAL MANAGEMENT OF DEMENTIA

INSTITUTIONS
1. Royal Free Hospital, London, United Kingdom
2. CHRU de Tours, INSERM U30, Université François Rabelais, Tours, France

AUTHORS
1. Nori Graham, Dr, MD, noriGraham@aol.com
2. Vincent Camus, Dr, MD, PhD, camus@med.univ-tours.fr

The slowly progressive, chronic nature of dementia puts great strain on both the person suffering from the condition and the carer. Much research in the past has focused on the emotional reactions of carers. But people with dementia themselves experience a whole range of emotions and these can lead to a range of psychological problems and behavioural changes. Understanding what the person with dementia is experiencing and learning how to react is key to the maintenance of a reasonable quality of life both for the carer and for the affected individual. This symposium of the WPA section on Old Age Psychiatry will provide a clinical perspective, data on patient’s quality of life and a review of research in this area. Issues related to the management of severe state of the disease, and to the management of the end of life will also be discussed.

NON PHARMACOLOGICAL MANAGEMENT OF DEMENTIA: A CLINICAL PERSPECTIVE

INSTITUTIONS
1. Royal Free Hospital, London, United Kingdom

AUTHORS
1. Nori Graham, Dr, FRCPsych, noriGraham@aol.com

Dementia affects people in different ways. The most common symptoms that occur in dementia no matter what the cause are the cognitive symptoms of memory loss and difficulties with language. However, the non-cognitive symptoms, also known as the behavioural and psychological symptoms (BPSD), are often the presenting problems leading to diagnosis as well as the most problematic symptoms throughout the course of the disease. Management of these difficulties requires obtaining a detailed life history as well as an accurate description of the problem behaviour both from the person with dementia and the person caring. This presentation will focus on non-pharmacological management with particular reference to behavioural approaches while at the same time indicating when drugs may be helpful.
PERCEIVED QUALITY OF LIFE IN DEMENTIA: DIFFERENCES BETWEEN PATIENTS AND CARERS

INSTITUTIONS
1. CHRU de Tours, INSERM U930, Université François Rabelais, Tours, France
2. Division of Psychiatry, University of Manchester, Manchester, United Kingdom

AUTHORS
1. Vincent Camus1, Dr, MD, PhD, camus@med.univ-tours.fr
2. Eleanor Jane Byrne2, Dr, MD, Ejbgob@aol.com

Background: Behavioural and Psychological Symptoms of Dementia (BPSD) have a high prevalence amongst patients with dementia and are a significant source of distress for both patients and caregivers. Most of behavioural symptoms can be prevented or treated by appropriate non-pharmacological interventions. But the choice of main target symptoms should consider not only symptoms’ intensity but also their potential impact on quality of life.

Objectives: The present study explored the relationships between quality of life and BPSD from both patient and carer perspectives.

Methods: Among one hundred and sixty seven patients (63 males and 104 females) recruited within 5 centres of the European Alzheimer’s Disease Consortium, data were obtained from forty-six patients and 116 carers who completed ratings of both BPSD (NPI) and quality of life assessment (QOL-AD).

Results: Patients perceive their own quality of life better than caregivers do. Poor ratings of QOL made by patients are associated with symptoms they are likely to find distressing such as delusions and apathy. Conversely, poor ratings of patients’ QOL made by carers are associated with symptoms that carer may find more distressing than the patient, such as irritability and depression.

Discussion: These findings suggest that considering both patient and caregiver perception of patients quality of life, should be useful to adapt care and management plans in dementia.

NON PHARMACOLOGICAL MANAGEMENT OF DEMENTIA: RECENT RESEARCH FINDINGS

INSTITUTIONS
1. University College of London, Department of Mental Health Sciences, London, United Kingdom
2. The Johns Hopkins University and Hospital, Division of Geriatric Psychiatry and Neuropsychiatry, Baltimore, United States
3. Kent Institute of Medicine and Health Sciences, Canterbury, United Kingdom

AUTHORS
1. Gil Livingston1, Dr, MD
2. A Selwood1, Dr, MD
3. K Johnston1, Mr, MSc
4. J Paton1, Mr, BSc
5. Constantine G Lyketsos2, Dr, MD, MHS
6. Cornelius Katona3, Dr, MD

Objective: To review the literature on psychological approaches to treating the neuropsychiatric symptoms of dementia and of the efficacy of interventions for dementia caregivers.

Method: Reports of studies that examined effects of any non-pharmacological therapy that satisfied pre-specified criteria were reviewed. Data were extracted and an overall rating was given to each study by using the Oxford Centre for Evidence-Based Medicine criteria.

Results and Conclusions: A total of 1,632 studies were identified, and 162 satisfied the inclusion criteria for the review. For caregiver interventions, 62 of the 244 studies identified in our search met our inclusion criteria. In terms of effects on demented patients, specific types of psychoeducation for caregivers about managing neuropsychiatric symptoms were effective treatments whose benefits lasted for months, but other caregiver interventions were not. Behavioural management techniques centred on individual patients’ behaviour or on caregiver behaviour had similar benefits, as did cognitive stimulation. Music therapy and Snoezelen, and possibly sensory stimulation, were useful during the treatment session but had no longer-term effects; interventions that changed the visual environment looked promising, but more research is needed. In terms of caregiver benefits, we found excellent evidence for the efficacy of six or more sessions of individual behavioral management therapy centered on the care recipient’s behavior in alleviating caregiver symptoms both immediately and for up to 32 months. Teaching caregivers coping strategies either individually or in a group also appeared effective in improving caregiver psychological health both immediately and for some months afterwards. Group interventions were less effective than individual interventions.
MANAGING OF SEVERE DEMENTED PATIENTS AT HOME TREATMENT AND CARE

INSTITUTIONS
1. Municipal Institute of Gerontology, Belgrad, Serbia and Montenegro

AUTHORS
1. Aleksandra Milicevic Kalasic, Dr, MD, PhD, aleksandrak@excite.com

The number of older individuals with dementia will likely increase significantly in the next decades, but there is currently limited information regarding many aspects of their life especially those with advanced or severe dementia. Communication and all activities in severe demented patients would be therapeutic, enhance quality of life, arrest mental decline and generate and maintain self-esteem or create immediate pleasure, re-establish dignity, provide meaningful tasks, restore roles and enable friendships.

Objective: in order to organize adequate care it was helpful to reveal the severity of cognitive disorders identified with screening test (Simon, 1968) among patients at Institute of Gerontology Home Treatment and Care.

Method: MMSE test (Folstein) was used for quantification of cognitive disorders previously identified through screening of population at admission in five year period. Screening test (Simon, 1968) was used at admission.

Results: Mean value of MMSE test score of N=370 patients with identified cognitive disorders through screening was 14.92; 318 were demented with mean value of MMSE test score 13.08. There was no statistical difference among men and women in any of following parameters.

Conclusion: The population at home treatment and care is highly selected with severe cognitive disorders previously detected with screening test. The results suggest introducing palliative measures for maintaining functional ability of all patients, systematic dissemination of instructions and supports for caregivers and preventive screening for cognitive disorders in elderly population in community with further implementation of diagnostic and therapeutic procedures.

THE END OF LIFE CARE IN DEMENTIA

INSTITUTIONS
1. Forensic Psychiatry Hospital, Stei, Romania

AUTHORS
1. Nicoleta Tataru, Dr, MD, nicoleta_tataru@hotmail.com

Health care providers have to face a serious medical and ethical challenge in caring the elderly demented patient at the end-of-life. The physical problems and pain management are important for individuals with dementia. The cognitive and communication problems in dementia make it more difficult to provide palliative care to these patients. Respect for the individual's expressed wishes and interest, should guide all end-of-life care decisions.

We discuss about the end-of-life care, and about 'the right to die'. The patients must have the right to refuse the treatment when they believe that their quality of life would be compromised by continued treatment and they must have the right to live and the right to die with dignity in their own homes. For specifying a 'good death', one would take into consideration cultural, religious, spiritual, and family values. According to Hippocratic Oath, patients have to be treated in dignity, but not to be 'over-treated' by all modern possibilities. Quality end-of-life care in dementia and other mental diseases is complex, requires a multidimensional approach, involving both health professionals and caregivers. This can be done with adequate funding, and sufficient staff resource, experienced and educated in the care of dying, ensuring that patient's psycho-social and spiritual needs are met, and we hope that dementia will be better treated if we use an educational prevention program to improve the quality of life in all courses of illness to the end of life.
THE PATIENT-ARTIST QUESTION: WHO IS WHO?

INSTITUTIONS
1. WPA Section on Art & Psychiatry, Chair, Vienna, Austria
2. Private Psychiatric Clinic, Nova Gorica, Slovenia

4. Magdalena Tyszkiewicz, Dr, MD, PhD, magdalena.tyszkiewicz@wp.pl
5. Alexandra Plettenberg-Serban, Dr, PhD, aplettenberg-serban@earthlink.net

This symposium by the WPA Section on Art and Psychiatry explores the ways in which the study of art brut contributes to our understanding of creative attainment in general. Works by both several “outsider” artists as well as of some recognized masters with a psychiatric history will be analyzed. Finally, future perspectives on the term “art brut” itself and its proper context placement will be discussed.

ERNST LUDWIG KIRCHNER: TRACES OF NARCISSISM IN HIS ART

INSTITUTIONS
1. Chair, WPA Section on Art and Psychiatry, Vienna, Austria

AUTHORS
1. Hans-Otto Thomashoff, Dr, MD, PhD, thomashoff@utanet.at

The German Expressionist Ernst Ludwig Kirchner suffered from a Narcissistic Personality Disorder. The paper reveals the influence of his psychodynamics onto his art and examines the causes for the artist's suicide in 1938.
PIGRO: «AN ABSOLUTE INDIVIDUALIST» AND HIS PORTRAIT STUDIES

INSTITUTIONS
1. Private Psychiatric Clinic, Nova Gorica, Slovenia
2. Institutum Studiorum Humanitatis / Graduate School of the Humanitie, Ljubljana, Slovenia

AUTHORS
1. Vlasta Meden Klavora, Dr, MD, vlastameden@gmail.com
2. Jure Mikuž, Dr, PhD, vlastameden@gmail.com

The patient's drawings or paintings could be perceived as the first evidence of the patient's psychotic experience. The expression of his own psychotic experiences and feelings reduces the anxiety provoked by his fear of defragmentation and destruction. The image is an effort to restitute the inner world, and the endeavor to establish the borders between the internal and the external, between the Self and the Other. The article will present the cycle of the 18 Pigro's drawings from one of his psychotic episodes. The cycle starts with the two drawings which were carried out in the state of scribbling that depicts the psychotic inner world from which the final image -- the portrait --slowly emerges.

THE LONELINESS OF THE NEW WORLD CREATORS - MCK CIURLIONIS

INSTITUTIONS
1. Center for Psychiatric Health, Gdynia, Poland

AUTHORS
1. Magdalena Tyszkiewicz, Dr, MD, magdalena.tyszkiewicz@wp.pl

The paper deals with the formation of the artistic individuality of MCK Ciurlionis (1875-1911), a renowned painter, musician, composer and playwright of Polish and Lithuanian origin. The aim of this paper is to provide comparison of the biological, social, schizophrenic and artistic profile of Ciurlionis with that of a patient of the pre-senter, a very interesting amateur painter M.Z. The following aspects have been compared: symbolism, use of colour, abstractionism and the expression of time and space.
AUTHENTICITY AND CULTURE IN THE ART OF RICHARD SMITH

INSTITUTIONS
1. Creedmore Psychiatric Hospital, The Living Museum, New York, United States

AUTHORS
1. Alexandra Serban-Plettenberg, Dr, PhD, aplettenberg-serban@earthlink.net

This paper proposes that the distinction between insider and outsider art will eventually disappear altogether, as the generic properties of self-taught artists, outsider art, or art brut, have long been challenged and cultural norms greatly expanded to include the global diversity of ethnic codes. The consequences of the changing social and aesthetic norms are discussed at the example of works by Richard Smith who has been a member of the Living Museum Studio at the Psychiatric Hospital Creedmoor in New York since 1993. In the words of Dr. Janos Marton, co-founder and director of the Museum, “Insanity is an asset in art. You don’t have to be insane to be a great artist, but it builds on the symptoms of mental illness. Great art really occurs in the domain where schizophrenic processes often occur.”

Through an examination of the work of Richard Smith, the paper aims to demonstrate that mental breakdown or psychotic experience can be conducive to an artistic authenticity that is not always within reach of mainstream artists; the status of confinement in community allows a greater freedom of peer- and market pressures of the money-driven art market of today.

This symposium proposed by the WPA Section on Art and Psychiatry addresses various aspects of the therapeutic and communicative functions of art. It also explores the role psychiatric art can play in shaping the social discourse on mental illness and in combating stigma.
ART AS A PRODUCT OF THINKING

INSTITUTIONS
1. WPA Section on Art and Psychiatry, Chair, Vienna, Austria

AUTHORS
1. Hans-Otto Thomashoff1, Dr, MD, PhD, thomashoff@utanet.at

Neurobiology and psychodynamic approaches allow a glimpse into the creational process, revealing that any perception is a construction based on the existing structure of the brain at a given point in time. Therefore it may not be surprising that the brain, while trying to cope with reality, creates art as well. Thus art becomes a language which can be used for influencing the brain (therapy) as well as for being effective in society (e.g. fighting the stigma of mental illness).

REVISITING MUKARZOVSKY: THE FUNCTIONS OF ART IN MENTAL HEALTH CONTEXT

INSTITUTIONS
1. City University of New York, Academic Affairs, New York, United States

AUTHORS
1. Ekaterina Sukhanova1, Dr, PhD, ekaterinas@verizon.net

Jan Mukarovsky, a founding member of the Prague Linguistic Circle, considered the work of art as a bridge which connects spectators to meaning, but also connects the authors to collectivity. Art perception also relies on a dialogical mechanism, which makes generating new meanings possible. This paper will explore the ways in which some of Mukarovsky’s theories on the aesthetic function can be applied to studying the dynamics of psychiatric art. The individual and the universal are no longer isolated but, on the contrary, require each other. The dialogical mechanisms inherent in art production and perception can serve as a basis for fighting stigma.
PROMOTING UNDERSTANDING AND TOLERANCE THROUGH ART: ANTISTIGMA EXPERIENCE BY THE MEANS OF INTERACTIVE EXHIBITIONS

INSTITUTIONS
1. Russian Art Therapy Federation, St Petersburg, Russian Federation

AUTHORS
1. Alexander Kopytin1, Dr, MD, alkop@rol.ru

Throughout the last several years a series of interactive exhibitions presenting the art of the mentally ill to the Russian society has been arranged and accompanied with the study of people's reactions to the artworks. The results of the study are indicative not only of the social distance from mental patients, but of the considerable potential of their art to make this distance smaller and thus destigmatize them as well. The results confirm in particular that exhibitions and seminars that involve creative interaction of people from the audience with mental patients' art help to reveal those realms of human experience that seem to be universal and valid both for people without psychiatric disorders and those suffering from mental illness. One of the findings of this study was the identification of the three thematic clusters (constructs) in the respondents' narratives. This finding leads the author to suggest that mental patients' art resonates with the general structure of the human psyche and serves as a valuable facet of mankind's culture.

ISSUES OF INCLUSION AND EXCLUSION

INSTITUTIONS
1. Goldsmiths, University of London, London, United Kingdom

AUTHORS
1. Diane Waller1, Dr, PhD, diane.waller@virgin.net

This paper will look at the position of older people specifically in the UK and at some of the findings and recommendations of a recent Age Concern Report: Older People's Mental Health and Well-Being. It will discuss the potential for exclusion from everyday activities and relationships of older people who suffer from mental health problems, of which depression is very common, as well as the more life-threatening and debilitating progressive illnesses. It will suggest how art therapy can play a role in improving quality of living, especially in social interaction.
THE PSYCHIC REALITIES PROJECT

INSTITUTIONS
1. Medical University of Vienna, Vienna, Austria

AUTHORS
1. Gerard Pail1, Dr, MD, gp@geraldpail.com

This paper will discuss the concept behind PSYCHIC REALITIES, a contemporary art exhibition in Austria, whose artistic approaches oscillate between socially standardized behavior and action patterns that enter the realm of pathological personality constructions. The project aims to raise awareness for behavioral models drifting away from the construct of “normality,” which has to be seen as a cultural signifier imposing aspects of decorum sometimes antagonizing personal wishes and desires. Ten positions of artists and artist groups, who were invited to formulate their versions of a reality that is influenced by psychic constellations of the self, demonstrate the “other side” of reality, which used to be hidden in conservative social climates but which has increasingly entered the realm of the visible world. Thus, the question of psychic disorders is artistically treated with regard to its relevant status in society and the changing methods with which it is treated and perceived. The project centers on the question of how specific patterns of behavior, which are not necessarily in line with social standardization, are subject to de-pathologizing mechanisms.

COMRADE HAMLET: A PSYCHOSOCIAL PORTRAIT OF THE SOVIET INTELLIGENTSIA

INSTITUTIONS
1. City University of New-York, literature, New-York, United States

AUTHORS
1. Ekaterina Sukhanova¹, Mrs. Professor, PhD, ekaterinas@verizon.net

The seminal novel by Andrei Bitov’s “The Pushkin House” will be used to discuss the effects of a totalitarian regime on the development of individual identity. Bitov depicts a society in which the links to the country’s history, intellectual tradition and even to one’s own family legacy are all artificially severed. Language ceases to be trusted as it is perceived as a tool of propaganda rather than means of creative liberation. The “new man” promised by social engineering turns out to experience identity diffusion, emotional lability and intense dependence on others. The protagonist of „The Pushkin House”, described in a way reminiscent of an extended case study, reflects the immaturity of his society, in which dichotomous thinking is fostered. Ironically, it is when the protagonist of the novel is finally able to gain a critical distance to himself and take responsibility for his proper actions, that his functioning within that society is threatened.

MODERN IRANIAN LITERATURE AND PSYCHIATRY

INSTITUTIONS
1. WHO, regional office Eastern Mediterranean, Health Protection and Promotion, Cairo, Egypt

AUTHORS
1. Ahmad Mohit¹, Mr, Professor, Drec, MD, PhD, mohitahmad@gmail.com

Modern Iranian literature started in the end of the nineteenth century, coinciding with Iranian Constitutional Revolution. “Nima Yushij”, the founder of Iranian modern poetry and “Sadeq Hedayat”, the famous Iranian novelist were among the most influential Iranians of the 20th century. Classically, Persian poetry was a part of a great cultural heritage. Later on, it fell into a period of stagnation and ceremonial court function. “Nima Yushij” modernized Iran’s poetry in form and content. The modern poetry Nima initiated was followed by poets like “Shamlou” and “Fowough Farrokhzad”, the great women poet who died at age 32 in a car accident (note 1). “Sadegh Hedayat” penetrated the soul of the nation in the beginning of deep transition. He described Iranian characters, imaginings and dreams creatively. “Surrealism or something approaching it, was the hallmark of Hedayat psycho fiction” (note 2). The themes of mental illness and mental institutions are repeated in his work. And, it is ironic that Hedayat committed suicide in 1952.

The famous contemporary playwright of Iran “Sa’edi”, was a psychiatrist and one of his plays “The Cow” is the story of the dissociative condition of a peasant and was made to a famous Iranian film winning major international prizes.

THE THREE STAGES OF VIOLENCE IN SHAKESPEARE’S PLAY “TITUS ANDRONICUS”

INSTITUTIONS
1. Psychiatric Evolution, literature, POISSY, France

AUTHORS
1. Yves G Thoret¹, Mr Doctor, MD, PhD, President, thoret.yves@wanadoo.fr

In this tragedy, W. Shakespeare presents three stages of human cruelty:
- murder of an enemy male-soldier: destruction of a life,
- rape and mutilation of a woman: destruction of the life source,
- and the worst crime, murder of a child: destruction of a life promise.

“Titus Andronicus” describes the irresistible spiral of revenge and violence, leading the protagonists to commit more and more archaic actions against their rivals or enemies and, later on, against their adversaries’ families, till acting directly against their own families. This is described in the Greek myth of Heracles, driven mad by Hera and polluted by his own violence, in the Euripides’ and Seneca’s tragedies. A current enquiry checked that in the violent fights between drug traffic gangs in Central America, the proportion of women among the victims was strongly increasing. We may fear an extension of crimes against children, in such an uncontrolled social context of violence. This play, and its new version by Botho Strauss, may help us to analyse how violent acts may link themselves together in a progressive outbidding, reducing so any possibility of compromise or return back to peace.

AUTHORS
1. Yves G Thoret¹, Mr Dr, MD, PhD, thoret.yves@wanadoo.fr

Symposium of the WPA Section “Literature and Psychiatry”

This is the second symposium of the WPA section “Literature and Psychiatry”. It is entitled: “Literature across the borders”. Beginning with an homage to the “Velvet Revolution” in Prague, it will study the psychic effects of creative poetry, in the case of F. Hölderlin, and it will analyze the main aspects of holistic philosophy in the works of the Iranian poet Rumi.

THE ROLE OF LITERATURE BEFORE AND SINCE THE “VELVET REVOLUTION”

INSTITUTIONS
1. Modrá laguna - centrum duševní pohody, Družicová 12, Praha 6 - Ruzyně, Czech Republic
2. L’Evolution Psychiatrique, psychiatrie, Paris, France

AUTHORS
1. Jan Cimicky², Dr, MD, CSc, primar@modra-laguna.cz

The Czech, Slavian tribes of Bohemia, in the middle of Europe, were always obliged to shield themselves from multiple aggressions. When Saint Wenceslas had to accept submission to the Germans in the Xth century, the people resisted with “corals”, our first poems usually sung in churches to pray God for strength, protection against misfortune and distress.

In every tragic moment of our history, poetry and folk songs are the means of resistance to all types of oppression, military, ideological, economic ones or actually the „laws of market“. Our people has such a high need of noble fantasy, creative beauty, hope and memory. Literature will not die from disinterest, considering the great number of books published now in our nation. Poetry is the most eminent literary form to move the most magic level of emotion. Without poems, the men would not be men! In the invisible psychic life, poetry works as a tool of compensation or regulation, just like love and friendship.

Let us admit that „The Vervet Revolution“ was the peak of this achievement. But, since the eighties, we observe an increasing passivity and indifference of the youth towards cultural and artistic stimulations, with the risk to neglect active reading and to prefer more superficial, comfortable and global information and entertainment. If we desire to „rebirth“ literature and rich interpersonal communication, we have to express this aim with means of communication presently available, to resist to cruelty and insensibility, to fight for a society with more justice and comprehension.

The relationship between creativity and insanity is a topic that has been discussed in various studies. One important issue to be considered when discussing this is the question of whether there is in fact an internal link between creativity and insanity. For example, does creativity have a destructive effect on the human mind, or can insanity lead to creativity? This presentation will discuss this issue while referring to the life and works of Friedrich Hölderlin (1770-1843), a major German poet who succumbed to schizophrenia. Hölderlin's fundamental existential position is characterized by pronounced yearning for existential truth, along with his strong commitment to God-searching and his obsession with death. Facing high-intensity existential urgency and having reached a crisis condition involving the negation of his own existence, Hölderlin founds himself forced to undergo a self-reconstruction. The act of writing poetry became an ideal solution. For Hölderlin, the purpose of writing was to ease somewhat the highly intense existential pressure he experienced, or perhaps to control it and subsume it into his writing, in which we can find expressions both of “teologia positiva” and “teologia negativa”.

CONCEPTS OF RELEVANCE FOR PSYCHIATRY IN THE WORKS OF SUFI (MYSTIC) THINKERS LIKE RUMI

INSTITUTIONS
1. WHO, Health Protection and Promotion, Cairo, Egypt

AUTHORS
1. Ahmad Mohit
   Mr Prof., Dir., MD, PhD, mohitahmad@gmail.com

Mystic thinking has many traditions and all major three monotheistic religions have their own approach to mysticism. Islamic mystic thinking, has 2 major Eastern and Western branches, referring respectively to the Andulucian and Persian-Dari works. The Eastern one, represented in the works of many including “Bayazid Bastami, Suhrawardi” and “Rumi”, and the Western in the works of “Ibn e Arabi”. The major philosophical stands of mystic thinkers of all origins is their tendency to a Holistic approach to the world. They also believe in the presence of intuitive knowledge. Another important aspect of their beliefs, which is the essential element of the thinking of “Ibn e Arabi” and “Rumi” is the concept of “Vahdat e Vojoud” (unity of Existence).

The works and ideas of Rumi are most famous among Western readers. Rumi is really a thinker belonging to the whole humanity. His approach to life and growth is evolutionary. In many of his works, he describes dualism inside the soul and conflicts as the major cause of anxiety and promotes love and a sense of belonging as a remedy for many ills; his major book “Mathnavi” , written in form of many stories has numerous references to people whom we would give them definite psychiatric diagnosis. It is an interesting description of history of psychiatry and the correct understanding of mystic thinking. Finally, like many other areas, mysticism has a potential of abuse which the presentation tries to point out.

ADVANCES IN THE NEUROBIOLOGY OF ADHD

INSTITUTIONS
1. Massachusetts General Hospital, Pediatric Psychopharmacology, Boston, United States
2. SUNY Upstate Medical Center, Psychiatry, New York, United States

AUTHORS
1. Joseph Biederman1, Dr., MD, jbiederman@partners.org
2. Stephen V Faraone2, Dr., PhD, faraones@upstate.edu
3. Nikos Makris1, Dr., MD, nikos@cma.mgh.harvard.edu
4. Thomas J Spencer1, Dr., MD, tspencer@partners.org
5. Aude Henin1, Dr., PhD, ahenin@partners.org

The objective of this symposium is to provide an overview of current developments in the study of the neurobiological underpinnings of ADHD. The presentations will comprise findings from the fields of structural neuroimaging (Drs. Biederman and Makris), positron emission tomography (Dr. Spencer), genetics (Dr. Faraone) and psychiatric comorbidity (Dr. Henin).

STRUCrURAL MRI IN ADULTS WITH ADHD WITH AND WITHOUT BIPOLAR DISORDER

INSTITUTIONS
1. Massachusetts General Hospital, Pediatric Psychopharmacology, Boston, MA, United States

AUTHORS
1. Joseph Biederman1, Dr., MD, jbiederman@partners.org

Objectives: We previously found that relative to controls, ADHD adults had significantly smaller overall cortical gray matter, prefrontal and anterior-cingulate volumes. In this study we tested the hypothesis that bipolar disorder (BPD) would contribute to limbic (amygdala-hippocampal) abnormalities and ADHD to cortical abnormalities described above.

Methods: Twenty-six ADHD adults without BPD, 31 with ADHD+BPD, 18 with BPD and 23 controls comparable on age, SES, gender, handedness, education, IQ estimate distributions received MRI scanning on a 1.5T-Siemens scanner. Cortical and sub-cortical gray and white matter were segmented. Image parcellation divided the neocortex into 48 gyral-based units/hemisphere. Based on a priori hypotheses, we focused on prefrontal, anterior cingulate cortex (ACC) and amygdala-hippocampal volumes. We used linear regression models with volumes of brain regions as the dependent variables and ADHD status, Bipolar status, age, sex and total cerebral volumes as the independent variables.

Results: ADHD adults had significantly smaller neocortex, thalamus and cerebellum cortex volumes, and significantly larger white matter and cerebellar white matter volumes, independent of Bipolar status. In contrast, Bipolar adults had significantly smaller amygdala volumes and significantly larger hippocampus and thalamus volumes, independent of ADHD status.

Conclusion: Regardless of comorbidity with each other, ADHD and BPD are associated with distinct neuroanatomical findings. While ADHD leads to volume differences in brain regions in areas involved in attention and executive control, BPD leads to volume differences in brain regions in areas involved in limbic and emotional regulation.

ALTERED CORTICAL NETWORKS IN ADULTS WITH ADHD USING T1-WEIGHTED AND DT-MRI

INSTITUTIONS
1. Massachusetts General Hospital, Pediatric Psychopharmacology, Boston, MA, United States

AUTHORS
1. Joseph Biederman, Dr., MD, jbiederman@partners.org
2. Nikos Makris, Dr., PhD, nikos@cma.mgh.harvard.edu

OBJECTIVES: The main aim of the present study was to examine the cortical brain structure of human attention and executive function (EF) networks, delineating the nature of alterations in the cerebral cortex and in cortico-cortical fiber pathways in adults with ADHD.

METHODS: We studied the cortex and the white matter fiber pathways that constitute these neural networks using two modalities of MRI. A) We performed T1-weighted MRI morphometry to measure thickness of cortical regions dedicated to the operation of attention and EF in 24 adults who have been categorized as meeting criteria for ADHD compared with 18 matched healthy control subjects. B) We used DT-MRI in another sample to measure fractional anisotropy (FA) differences in 12 adults with ADHD and 17 matched healthy control subjects.

RESULTS: A) T1-weighted MRI results showed that the subjects categorized as ADHD showed significant decrease of thickness in cortical areas dedicated to the operation of attention and executive functioning, i.e. dorsolateral prefrontal, dorsal anterior cingulate and inferior lateral parietal cortices (1, 2). B) The DT-MRI results showed significant differences in fiber tracts related to the attention and EF neural systems.

CONCLUSION: These cortical and white matter results imply that discovery of a selective difference in cortical thickness of cortical areas and fiber tracts constituting the attention and executive function cortical networks in adults with ADHD might be regarded as the MRI brain structural profile responsible for the attention and EF phenotypic deficiency in this disorder.

PET IMAGING OF DOPAMINE TRANSPORTER DYSREGULATION IN ADHD AND METHYLPHENIDATE OCCUPANCIES

INSTITUTIONS
1. Massachusetts General Hospital, Pediatric Psychopharmacology, Boston, MA, United States

AUTHORS
1. Joseph Biederman, Dr., MD, jbiederman@partners.org
2. Thomas Spencer, Dr., MD, tspencer@partners.org

OBJECTIVE: The dopamine transporter (DAT) is known to be a key regulator of dopamine and recent studies of genetics, treatment and imaging have highlighted the role of DAT in Attention Deficit-Hyperactivity Disorder (ADHD). However, the findings of in vivo neuroimaging of DAT in ADHD have been somewhat discrepant.

METHODS: DAT binding was measured using a highly selective ligand (C-11 altporane) and positron emission tomography (PET). The first sample consisted of 47 well characterized, treatment naďve, non-smoking, non-comorbid adults with and without ADHD. Additionally, controls had few symptoms of ADHD. Other studies were performed in normal controls to examine DAT occupancies of different formulations of methylphenidate.

RESULTS: Results showed significantly increased DAT binding in the right caudate in untreated adults with ADHD compared with matched controls without this disorder. While results in the literature are mixed, a meta-analysis showed that overall results supported increased DAT binding in ADHD. In separate samples, methylphenidate DAT occupancies varied by time (post dosing) and formulation.

CONCLUSION: These results confirm abnormal DAT binding in the striatum of adults with ADHD and provide further support that dysregulation of DAT may be an important component of the pathophysiology of ADHD. Methylphenidate DAT occupancies of different formulations were consistent with clinical response at specific times post dosing.

GENOME-WIDE ASSOCIATION SCAN OF ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD)

Institutions
1. Massachusetts General Hospital, Pediatric Psychopharmacology, Boston, United States
2. SUNY Upstate Medical University, Child and Adolescent Psychiatry Research, Syracuse, NY, United States

Authors
1. Joseph Biederman¹, Dr., MD, jbiederman@partners.org
2. Stephen V Faraone², Dr., PhD

Objective: Although psychiatric geneticists have begun to produce replicated findings implicating specific genes or chromosomal loci in the etiology of ADHD, most of the genes underlying these disorders have remained elusive. One obstacle to gene discovery for ADHD has been the lack of a tool for screening the genome for genes of small effect. That lacuna has now been filled by genome-wide association scan (GWAS) which uses hundreds of thousands of SNPs to screen the genome.

Methods: We use data from the International Multisite ADHD Genetics (IMAGE) project. IMAGE families were identified through ADHD probands ages 5 to 15 at data collection sites in Ireland, the UK, the Netherlands, Germany, Belgium, Switzerland, Spain and Israel. All family members were Caucasians of European origin. Probands met criteria for DSM-IV combined-type ADHD and were diagnosed using the Parental Account of Child’s Symptoms.

Results: The IMAGE project has completed a GWAS on 958 parent-child trios at Perlegen. Their genotyping platform comprises 600,000 tagging SNPs designed to be in high linkage disequilibrium with untyped HapMap SNPs. The r² measure of linkage disequilibrium of the Perlegen SNPs with nonassayed HapMap SNPs is greater than 0.8 for 93% of samples, and greater than .5 for 97% of samples. The average r² is 0.94. No SNP reached genomewide significance.

Conclusion: The GWAS method should provide new insights into the genetic etiology of ADHD.

TEMPERAMENTAL RISK FACTORS FOR DISRUPTIVE BEHAVIOR DISORDERS

Institutions
1. Massachusetts General Hospital, Pediatric Psychopharmacology, Boston, MA, United States

Authors
1. Joseph Biederman¹, Dr., MD, jbiederman@partners.org
2. Aude Henin¹, Dr., PhD, ahenin@partners.org

Objectives: This presentation will provide an overview of research on the outcomes of temperament precursors to psychopathology. In particular, we will focus on behavioral disinhibition (BD), the temperamental tendency to exhibit boldness, approach, and spontaneity in unfamiliar situations. BD, which has been hypothesized to be rooted in limbic areas and neural reward circuitry, may predispose to impulsive approach behaviors and heightened frustration if approach is restricted.

Methods: We recruited parents with panic disorder and/or major depression, as well as control parents without major mood or anxiety disorders, and their offspring. Children (ages 21 months-6 years) were assessed temperamentally using age-specific protocols in which they were observed interacting with unfamiliar toys, examiners, and cognitive tasks. Children were subsequently assessed diagnostically at age 6 and again at mean age of 10 using the K-SADS-E.

Results: BD was associated, at age 6, with lifetime rates of disruptive behavior disorder (Odds Ratio [OR]=3.0[1.5-6.3]), ADHD (OR=3.0[1.4-6.6]), comorbid disruptive behavior plus mood disorders (OR=9.3[1.1-81.0]), and a higher rate of placement in special classes (5% vs. 0%, p<.05). At age 10, BD continued to predict lifetime comorbid disruptive behavior plus mood disorders (OR=8.4[1.2-59.0]), as well as current disruptive behavior disorders (OR=2.8[1.05-7.4]) and oppositional-defiant-disorder (OR=3.5[1.1-11.2]).

Conclusions: Among offspring at high-risk for psychopathology, children’s temperamental style of reacting to novelty in early childhood differentially predicts subsequent patterns of diagnostic and functional outcomes in middle childhood.

3. James L Kennedy², Dr., MD, James_Kennedy@camh.net
4. Iris Manor³, Dr., MD, dan100@netvision.net.il

Over the past 12 years, progress in identifying genes contributing to attention deficit hyperactivity disorder has been swift with a number of susceptibility genes identified and findings replicated. Early studies focused on genes involved in neurotransmitter release and response; however, more recent studies have begun to investigate new lines of research including genes involved in brain development, neuronal migration, synaptic plasticity, and the relationship to comorbid disorders. Genetic studies are also beginning to examine how these genes contribute to this complex phenotype by determining how genetic variation in susceptibility genes results in a change in gene function. This symposium will review the progress in gene identification thus far as well as cover new avenues of research and progress in functional studies.

IDENTIFICATION OF GENES CONTRIBUTING TO ATTENTION DEFICIT HYPERACTIVITY DISORDER AND DYSLEXIA: EVIDENCE FOR ASSOCIATION WITH GENES INVOLVED IN NEURONAL MIGRATION

INSTITUTIONS
1. The Toronto Western Research Institute, Genetics and Development Division, Toronto, Canada
2. The Hospital for Sick Children, Program in Neurosciences and Mental Health, Toronto, Canada

AUTHORS
1. Cathy L Barr¹, Dr., PhD, cbarr@uhnres.utoronto.ca

5. Elizabeth Kerr², Dr., PhD, elizabeth.kerr@sickkids.ca
6. Maureen W Lovett², Dr., PhD, mwl@sickkids.on.ca

Objective: Many individuals with developmental dyslexia (DD) are also diagnosed with attention-deficit hyperactivity disorder (ADHD) and approximately 20% of individuals with ADHD will have evidence for DD. The basis for this overlap is not completely understood but twin studies have provided support for common genetic influences, particularly for inattention symptoms. Genetic linkage studies have found significant evidence for linkage of DD to multiple chromosomal regions and evidence for linkage/association to ADHD has also been found to overlap for some of these regions. The objective of this study is to identify genes contributing to both.

Methods: We examined evidence for the involvement of specific genes in these chromosomal regions using a sample of families identified with reading difficulties (n= 273 families).

Results: Our studies of the 6p region indicate association of ADHD and ADHD symptoms with multiple markers in the 6p region including markers in the DCDC2 and VMP genes. In the 15q region we have found evidence for association for markers in the protogenin gene for both ADHD symptoms and DD. We have also found evidence for the gene for the dopamine receptor D1 to be associated to inattention symptoms in families with DD but not with reading skills in these families.

Conclusions: While the studies of the overlap in ADHD and DD are preliminary, they are promising in that they will ultimately help to disentangle the causal relationship.
MOLECULAR APPROACHES FOR THE IDENTIFICATION OF CAUSAL REGULATORY VARIANTS IN ADHD SUSCEPTIBILITY GENES

12. Cathy L Barr11, Dr, PhD, cbarr@uhnres.utoronto.ca

Objective: A number of genes are associated with ADHD, however, in most cases, the causal DNA variants remain to be identified. It is likely that many causal variants will be regulatory variants, i.e. DNA changes that alter some aspect(s) of gene expression. To search for these, regions that are either known or likely to harbour regulatory elements (e.g. promoter region, 3′-untranslated region (3′-UTR), remote elements) must be investigated. We are currently applying this strategy to search for causal variation in the DRD1 gene, a gene associated with ADHD and with inattentive symptomology.

Methods: A sequencing screen of the promoter region was conducted, and investigation of the 3′-UTR is planned. Also, a method involving chromatin immunoprecipitation coupled with genomic microarrays (ChIP-Chip) is being used to map the location(s) of modified histones. This can indicate the locations of accessible DNA regions that may be functionally active.

Results: In the promoter screen, no ADHD-associated variants were identified. The ChIP-Chip approach identified a potential regulatory region downstream of the gene. While an initial investigation of 3 known DNA variants in this region did not show evidence for association with ADHD, further analyses are ongoing.

Conclusion: Detailed molecular approaches, such as the ones described above for DRD1, will be critical for the identification of regulatory variants that play a causal role in ADHD. Identification of the causal variants will, in turn, contribute to a clearer understanding of the genetic and neurobiological bases of the disorder.

BDNF AND LIN-7 GENE VARIANTS IMPLICATE SYNAPTIC PLASTICITY MECHANISMS IN ADULT ADHD

INSTITUTIONS
1. Centre for Addiction and Mental Health, Neurogenetics Section, Toronto, Canada
2. GlaxoSmithKline, Psychiatry, Verona, Italy

AUTHORS
1. James L Kennedy1, Dr, MD, James_Kennedy@camn.net
2. Mark Lanktree1, BS
3. A Squassina1
4. Umesh Jain4, Dr, MD, Umesh_Jain@camh.net
5. Pierandrea Muglia5, Dr, MD, Pierandrea_Muglia@camh.net

Adult ADHD confers an increased risk of ADHD in relatives when compared to childhood ADHD, possibly due to a greater genetic liability than the childhood form. Brain-derived neurotrophic factor (BDNF) is a neurotrophin expressed in the brain throughout life and is involved in survival, differentiation, and synaptic plasticity of several neuronal systems including dopaminergic pathways. The gene for LIN-7 is another candidate positioned immediately downstream of BDNF. LIN-7 is selectively expressed in specific neuronal populations and is involved in the postsynaptic density of neuronal synapses. We tested for association between five BDNF gene markers, two LIN-7 markers and adult ADHD. The sample consisted of 80 triad families comprised of an adult ADHD proband and their biological parents and an independent sample of 121 adult ADHD cases and a corresponding number of control subjects (total 201 ADHD probands). Allelic and haplotype association was found between both BDNF and adult ADHD, and LIN-7 and adult ADHD. The valine variant of BDNF showed an odds ratio of 1.65 (p=0.0096). Furthermore, the C allele of marker rs10835188 in the LIN-7 gene was significantly more common in controls (odds ratio = 1.61, p=0.0071). The Chip-Chip approach identified a potential regulatory region downstream of these adjacent genes. These positive results suggest that synaptic plasticity as a mechanism may be involved in adult ADHD. Further investigations into the pathologic mechanisms of BDNF and LIN-7 in adult ADHD are warranted.

2. Dimitris Anagnostopoulos2, Prof. Dr., MD, PhD, danagnos@otenet.gr

The aim of the symposium is to share experience and present research data from four European countries (Finland, Greece, Bulgaria and Serbia) on community mental health programmes and services aimed to promotion of mental health and prevention of mental health disorders in children and adolescents.

HOW TO EVALUATE MENTAL HEALTH NEEDS AMONG CHILDREN?

INSTITUTIONS
1. University Hospital of Tampere, Finland

AUTHORS
1. Tulla Tamminen1, Prof. dr, MD, PhD
2. P. Kaukonen2
3. A-M Borg3

Well-baby clinics and school health care systems cover nearly all children in Finland (over 95%). Promotion of mental health and prevention of psychosocial problems are nowadays important aims of these services. Evaluating mental health disorders and screening of child’s and his/her family’s needs for interventions have become increasingly significant but also demanding.

We have developed a questionnaire based method for primary health care professionals to screen, assess and understand child’s mental development and well-being. The main aim of the method is to help front-line workers, both doctors and nurses, especially in their decision making, when, how and where to intervene.

Now we are validating the method and testing its feasibility in a large scale study in well-baby clinics and at schools with over a thousand children in two areas in Finland. The development of the method and its usefulness will be presented and discussed.
EARLY INTERVENTION PROGRAMME FOR CHILDREN WITH SPECIFIC DEVELOPMENTAL DISORDERS

INSTITUTIONS
1. Department of Psychiatry, Medical School, University of Athens, Greece

1. M. Vlassopoulos
2. I. Tsipra
3. L. Legaki
4. V. Rotsika
5. H. Lazaratou
6. Dimitris Anagnostopoulos

Introduction
The Early Intervention Programme (EIP) for specific developmental disorders (SDD) has been functioning as part of the services of a Community Mental Health Centre in Athens for 25 years. This programme serves both children with SDD and their families according to an interdisciplinary, biopsychosocial model. Early intervention's goal which is to prevent or allay the development of further disorders in these children seems to be best served by such a theoretical framework. These programmes must be evaluated longitudinally to ascertain their clinical effectiveness.

Purpose
The present study compares the development of children with specific developmental disorders who completed the EIP (N=44) with children who had been diagnosed, but did not comply with treatment (N=52). All participants were re-evaluated in adolescence.

Material and Methods
Data was collected concerning the child's initial diagnosis, developmental history, intellectual ability, emotional, behavioural and social skills, family organization and socio-economic factors. A parental questionnaire provided information on the participants' present status with respect to language ability, scholastic achievement, behaviour, emotional and social skills.

Results
At re-evaluation, treated subjects exhibited less persisting language disorders, had fewer difficulties at school, better concentration and study skills and did not exhibit behaviour disorders. Furthermore, the younger the child commenced therapy, the less likely he/she was to have persistent symptoms in adolescence.

Conclusion
The implications of our findings corroborate the positive effects of early intervention, particularly when this is conducted under an interdisciplinary framework.

HOME VISITING PROGRAMME IN PREVENTION OF CHILD ABUSE AND NEGLECT

INSTITUTIONS
1. Faculty for Special Education and Rehabilitation, Serbia and Montenegro
2. Institute of Mental Health, Serbia and Montenegro

AUTHORS
1. Veronika Ispanovic-Radojkovic
2. Milica Pejovic-Milovancevic
3. Nenad Rudic
4. Jelena Radosavljev
5. Ana Radojkovic

Aims
Research evidences suggest that preventive early home visiting programmes have beneficial effects on the reduction of abuse and neglect by improving parental skills and knowledge on child development. The study explore the effectiveness of home visiting service in prevention of child abuse and neglect.

Method
A group of community nurses originally trained in the EEPP project according the Parent Adviser Model were additionally trained to identify families at risk for child abuse and neglect and to work with mothers identified as in need using counselling skills (Intervention Group). Their services were compared with the regular services delivered by community nurses who were not trained within the EEPP project (Comparison Group).

Results
There was no significant difference between the Intervention and the Comparison Group in the number of families identified as in need but they differed in the frequency and the type of the problems identified within the families. The follow up of the outcome (after 2 years) indicates that incidence of child abuse and neglect was 4 times lower in the families visited by the nurses trained according the Parent Adviser Model.

Conclusion
The Parent Adviser approach has potential value in prevention, early recognition and targeted early intervention with vulnerable families. Used within an intensive home visiting programme, it can be an effective method for preventing abuse and neglect.

PREVENTION OF MENTAL HEALTH DISORDERS IN CHILDREN AND ADOLESCENTS IN BULGARIA

INSTITUTIONS
1. South-West University Neofit Rilski, Bulgaria

AUTHORS
1. Vaska Stancheva-Popkostadinova

The aim of the study is to overview the current situation regarding mental health promotion and prevention of mental health disorders in children and adolescents in Bulgaria. The stress is on the activities of primary, secondary and tertiary prevention.

Methods: Systematic analysis of normative documents, policies and practices, as well as published reports and articles

Results point to lack of coherent policy for mental health promotion and prevention for children and adolescent, an insufficient number of services for children with mental health disorders, lack of coordination between different authorities at horizontal and vertical levels, centralization of activities and programs in the biggest cities of the country, insufficient number of mental health specialists.

Conclusion: The good practices for prevention and promotion of mental health should be disseminated and network of services should be created, covering the needs of children and adolescent in all parts of the country.

2. Smiljka Popovic-Deusic
3. Veronika Ispanovic-Radojkovic

Over the past decade there has been increasing interest, discussion and research about the mental health needs and the challenges experienced by children and young people. Given the role that schooling plays in the lives of children and young people, the school setting has been identified as a critical environment for supporting the development of good mental health for children and young people. There is evidence that school-based programs in elementary, middle and high schools can influence positive mental health and reduce risk factors and emotional and behavioral problems through social-emotional learning and ecological interventions. Young people's development in the school environment is not only influenced by learning and the content of curriculum. Evidence suggests that good mental and physical health not only optimizes a young person's academic performance but also enhances the ability to cope with the challenges and stressors of daily life and to become a productive member of society in the longer term. Paper will present life skills education program, strongly supported also by WHO and UNICEF, as a preventive measure for a range of health and social problems includes the development of skills such as: decision making, problem solving, creative and critical thinking, communication, coping with stress, education about substances, etc. This program developed as a part of Action Plan of the National Strategy for Youth which was adopted by the Government in 2006. More then 50 high schools in Serbia started with program and results will be discussed.

Intersectional Symposium: WPA Classification and Private Practice Sections.

The objectives of this symposium are to address key, clinically useful, nosological concepts of mood, anxiety, and substance use and personality disorders. The first presentation will address the multiple comorbidities associated with mood disorders and will propose a theoretical perspective supporting a common diathesis underlying different phenotypic expressions. The second presentation will focus on the clinical validity of diagnostic system in attending to complex conditions such as mood-substance use disorder comorbidity and will discuss diagnostic models aimed at addressing clinical complexities. The third presentation will review research evidence demonstrating significant differences of bipolarity in women and their diagnostic and therapeutic implications. The fourth presentation will address salient issues in suicide prevention, especially as pertain to Eastern Europe where the suicide rate is among the highest in the world. Finally the discussion will also highlight the notion of temperament as an integrating nosological concept.

COMMON MENTAL DISORDERS: “COMORBIDITY OR DIFFERENT MANIFESTATIONS OF A COMMON DIATHESIS”

INSTITUTIONS
1. University of California at San Diego, Department of Psychiatry, San Diego, United States

AUTHORS
1. Hagob S. Akiskal

Aims: To make clinical and scientific sense of the multiple comorbidity in affective disorders

Methods: Literature review, including the author’s work

Results: Depression is commonly comorbid with multiple anxiety disorders, as well as alcohol and addictive disorders, and often an eating disorder, particularly bulimia. Axis II diagnosis such as borderline, dependent and/or narcissistic are often invoked, atypicality and seasonality is not infrequently used as qualifying characteristics. The question is whether such patients should be considered to have affective disorders with comorbid diagnoses, which is what is often recommended and is what psychiatrists in general practice follow. Unfortunately, in subspecialty settings, one diagnosis or another might prevail, such as an addictive disorder or an eating disorder. In settings where psychotherapy is the main modality, typically personality malfunction is the preferred diagnosis.

Conclusions: The evidence reviewed is extremely confusing if one were to assume that independent mental disorders existed. Rather, the author proposes a theoretical perspective whereby a common diathesis is involved in the genesis of different phenotypic expressions. Although the concept of bipolar II is not familiar to all psychiatrists and is often contested by some researchers and clinicians, it may well be a diagnostic category that subsumes or condenses most of the foregoing entities described. Such a perspective might be relevant to the therapeutic process and in preventative strategies especially when it comes to suicidality.

CO-EXISTING ALCOHOL, SUBSTANCES AND AFFECTIVE STATES: A CLINICAL APPROACH

INSTITUTIONS
1. University of Miami Leonard M. Miller School of Medicine, Psychiatry and Behavioral Sciences, Miami, Florida, United States

AUTHORS
1. Ihsan M. Salloum¹, MD, MPH, DFAPA, isalloum@med.miami.edu

A core feature of a classification system is its clinical utility, which is the ability of the classification system to advance clinical decision making to guide treatment and help improve outcome. Alcoholism, other substance abuse, and mood disorders have been noted to co-exist since ancient times and are among the most frequent comorbid conditions in modern clinical settings. The objective of this presentation is to review current evidence of clinically significant interaction between mood, alcoholism, and other substance use disorders in terms of symptoms emergence and manifestation, longitudinal unfolding, treatment response, and impact on course and outcome of these coexisting conditions. This presentation will examine the adequacy of current classification in psychiatry at addressing this comorbidity and will discuss emerging diagnostic models, such as the WPA proposed Person-centred Integrative Diagnosis (PID) aimed at addressing clinical complexities and at enhancing the clinical validity of future psychiatric nosology.

BIPOLARITY IN WOMEN

INSTITUTIONS
1. University of Lisbon, Psychiatry, Lisbon, Portugal

AUTHORS
1. Maria Luisa Figueira¹, canessa@mail.telepac.pt

Female bipolarity differs from male bipolarity in clinically and theoretically significant ways. This presentation reviews gender differences in the epidemiology, phenomenology, course and comorbidity of the bipolar spectrum, discusses interactions between the female reproductive cycle and bipolar disorder. The role played by a depressive diathesis in the clinical presentation of women mood episodes is one of the important issues to be discussed. To explain other features like the association of female bipolarity with a higher prevalence of rapid cycling, mixed episodes and atypical features several hypothesis have been proposed. These include the role played by cyclic nature of estrogen production, metabolic factors and differences in the response to pharmacological agents. Some lines of research to answer these questions will be discussed. Gender differences in temperament (higher prevalence of the depressive temperament in women, and of the hyperthymic temperament in men) could be in part responsible for the females lower mean number of hypomanic episodes, higher mean number of depressive episodes, and more anxiety and somatisation. The implication of the differences between female and male bipolarity are very relevant regarding the diagnostic and therapeutic strategies that should be developed in clinical practice particularly in pregnancy and the postpartum.

TOWARD SUICIDE PREVENTION IN EASTERN EUROPE

INSTITUTIONS
1. Semmelweis Medical University, Department of Clinical and Theoretical Mental Health, Budapest, Hungary

AUTHORS
1. Zoltan Rihmer, rihmerz@kut.sote.hu

Suicide is a major public health problem in every country and particularly in Eastern Europe, where the suicide rates of Baltic Countries, Ukraine, Russian Federation, and Hungary have been always among the highest in the world. Between 1980 and 2002/2003 in Eastern Europe six countries (Hungary, Estonia, Slovenia, Latvia, Czech Republic, Slovakia) showed marked decrease in their national suicide rates and seven countries (Lithuania, Russian Federation, Ukraine, Belarus, Romania, Poland, Bulgaria) showed more and less increase. In the vast majority of the countries, unemployment, alcohol consumption, GDP, and divorce rate did not correlate with changing suicide rates and the only consistent correlation has been found between increase of antidepressant-prescription (9-fold increase in Hungary) and decrease of suicide rates (38% decrease in Hungary). The few years of alcohol prohibition during the Soviet “Perestroika”, in the midst of 1980’s, resulted in a dramatic (but temporary) decline in suicide mortality among males. However, political/economic changes after 1990 seem not to have a fundamental role in declining suicide rates in Eastern Europe. Recent data from some Eastern European/Post Communist countries (Hungary, Czech Republic, Slovenia, Slovakia) show that better recognition and more widespread treatment of depression is an effective method for suicide prevention even in the absence of specific national suicide prevention programs.

TOWARD A CLINICALLY USEFUL NOSOLOGY OF MOOD, ANXIETY, SUBSTANCE USE AND PERSONALITY DISORDER
- DISCUSSION

INSTITUTIONS
1. Aristotle University of Thessaloniki, 3rd Department of Psychiatry, Division of Neurosciences, Thessaloniki, Greece

AUTHORS
1. Kostas N Fountoulakis, kfount@med.auth.gr

A contemporary challenge is the integration of information from multiple sources in a model which will allow for a better strategic planning of therapy. The notion of temperament could serve as an umbrella to host these seemingly unrelated or diverse information. It seems to define both the specific features of the individual mood episode as well as the long term outcome of the disease, and particularly the response to treatment. ‘Classic’ clinical pictures are easier to recognize and to treat. Most agents preferably treat with higher rates specific clinical entities, however, today, the majority of patients do not fall into these ‘classic’ categories and the assessment of the temperament can reveal a number of clues highly predicting response to a specific treatment as well as the manifestation of a number of problematic effects of pharmacotherapy like agitation, induction of mixed states, rapid cycling and suicidality and even weight gain. Moreover, the knowledge of the temperament can guide the design of the therapeutic strategy with informed and careful simultaneous use of multiple agents.

AUTHORS
1. Michaela Amering, Univ.Prof., MD, michaela.amering@meduniwien.ac.at

Joint symposium WPA Section of Public Policy and Psychiatry and WPA Section on Stigma

Despite many efforts stigma and discrimination are still major obstacles for mental health efforts undermining recovery and social inclusion. This symposium will present data and concepts on sources of stigma and determinants of resisting and overcoming stigma on different levels. Heather Stuart’s presentation will review perspectives of stigma and discrimination from people with mental disorders and their family members. Richard Warner will present and discuss data showing that prognostic negativism about recovery from schizophrenia is not justified. The vital issue of stigma occurring in mental health treatment settings will be highlighted by Norman Sartorius. Michaela Amering will present data illustrating the need for further research into the concept of stigma resistance. Jan Wallcraft will start the discussion from the perspective of user involvement in policy and research.

COPING WITH STIGMA

INSTITUTIONS
1. Queens University, Department of Community Health and Epidemiology, Kingston, Canada

AUTHORS
1. Heather Stuart, Prof, PhD, heather.stuart@queensu.ca

People with mental health problems identify stigma as an impediment to social inclusion and a major barrier to recovery—worse than the disease itself. Yet, the majority of research on stigma has been conducted from the perspective of attitudes of the general population. These studies reveal that members of the general public have false and prejudicial beliefs about mental illness and the mentally ill, and prefer to distance themselves from people with mental health problems. Much less research has taken the perspective of those who are stigmatized. This presentation will review perspectives of stigma and discrimination from people with mental disorders and their family members. Canadian data will be used to illustrate the scope and impact of stigma experienced from the perspective of persons with mental health problems and from family members. Results will be used to highlight the importance of working with patients and family members to develop explicit stigma management strategies as part of comprehensive community based care.
DETERMINANTS OF RECOVERY AND REMISSION IN SCHIZOPHRENIA

INSTITUTIONS
1. University of Boulder, Department of Psychiatry, Boulder, United States

AUTHORS
1. Richard Warner¹, Prof, MD, drdickwarner@aol.com

Context: A common popular and professional misconception concerning schizophrenia is that recovery from the illness is rarely possible.

Objectives: This presentation will offer evidence that recovery from schizophrenia occurs frequently and will outline the factors that contribute to good outcome.

Key Messages: A meta-analysis of studies of outcome from schizophrenia in Europe and North America throughout the twentieth century reveals that there has always been a substantial social and complete recovery rate from the illness. The recent International Study of Schizophrenia confirms this finding and expands on it with respect to both the developed and the developing worlds. Employment, social inclusion and family involvement all appear to enhance recovery from schizophrenia.

Conclusion: Prognostic negativism about recovery from schizophrenia is not justified.

HEALTH STAFF AND STIGMATIZATION OF MENTAL ILLNESS

INSTITUTIONS
1. Association for the Improvement of Mental Health Programmes, Geneva, Switzerland

AUTHORS
1. Norman H. Sartorius¹

Stigma attached to mental illness (and the discrimination that is usually linked to it) represents the central obstacle to the improvement of mental health care. It affects the lives of the persons who have the mental illness but also all that is related to it - the families of the mentally ill, the institutions where they receive treatment, the medications that are used in the field of psychiatry and staff that works in this field.

There are different ways in which stigma related to mental illness can be prevented, diminished or even removed: among them there are several that depend on the behaviour and activities of staff working in the field of mental health. At present staff are often not aware of their contribution to the stigmatisation nor of the ways in which they could help to reduce it. The presentation will review both of these areas and suggest what could be done to optimise the role of health workers with respect to stigmatisation and consequent discrimination of people with mental illness.
STIGMA RESISTANCE - CONCEPT AND DATA

INSTITUTIONS
1. Medical University of Vienna, Department of Psychiatry and Psychotherapy, Vienna, Austria

AUTHORS
1. Michaela Amering¹, Prof, MD, michaela.amering@meduniwien.ac.at
2. Ingrid Sibitz², Dr, MD, ingrid.sibitz@meduniwien.ac.at

Context - Despite many efforts stigma and discrimination are still major obstacles for mental health efforts undermining recovery and social inclusion.

Objectives - The concept of stigma resistance will be presented and discussed.

Key messages - Individuals and groups with the capacity to counteract mental health stigma might play a crucial role in the fight against stigma and discrimination. Clearly persons from all spheres of life have shown that they can be unaffected by stigmatizing and discriminating environments or can generate strength through holding up in the face of such adversities. Stigma resistance can be conceptualized as a form of resilience and similar possible determinants can be explored. Among them are the concept of exposure versus avoidance and the role of turning point experiences. Finding out more about stigma resistance could be a crucial step in improving the situation of people and the effectiveness of interventions targeting stigma and social exclusion. Data on stigma resistance in patients with severe mental illness point to a special relevance of the concept of stigma resistance in the context of other perspectives on stigma and discrimination.

Conclusions - Research should focus on stigma resistance and its possible value as an independent variable as well as an outcome variable of specific and unspecific interventions in mental health care.

THE INFLUENCE OF THE JEWISH CULTURE ON PSYCHIATRY, PSYCHOANALYSIS AND CULTURAL PSYCHIATRY

INSTITUTIONS
1. East London NHS Foundation Trust, The Newham Centre for Mental Health, Cherry Tree Way, Glen Road, E13 8SP, London, United Kingdom

AUTHORS
1. Micol Ascoli¹, Dr, MD, micol.ascoli@eastlondon.nhs.uk

This Symposium will highlight how Jewish culture has influenced the origin and the development of different branches of Psychiatry, namely Psychoanalysis and Cultural Psychiatry, most of whose pioneers and luminaires are of a Jewish ethnic origin. The Jewish culture has always been concerned with minority status, migration, prejudice and discrimination, just like Cultural Psychiatry. Psychoanalysis, on the other hand, shows striking similarities, in its theoretical constructs, with the Jewish cultural conceptualization of the human being, as well as, in its practice, with the traditional Jewish methodology of study of the sacred texts. The invited authors will deal with different aspects and theoretical areas of this seldom considered but important subject. The above mentioned areas will also be illustrated in clinical practice through a 30 years follow up study of migrant Soviet Jews in Austria.
SIGMUND FREUD’S JEWISH LIFE AND THE JEWISH ROOTS OF PSYCHOANALYSIS

INSTITUTIONS
1. East London NHS Foundation Trust, Cherry Tree Way, Glen Road, E13 8SB, London, United Kingdom

AUTHORS
1. Micol Ascoli1, Dr, MD, micol.ascoli@eastlondon.nhs.uk

Psychoanalysis is, from the cultural point of view, one of the strongest and most successful theories of the functioning of the human mind ever elaborated in the West. Still nowadays, its basic constructs are widely applied in different fields of Psychiatry. Over the last one hundred years, scholars have been more concerned with the universal validity and applicability of the psychoanalytic theory and practice, rather than with their cultural relativity. Only a few studies so far have dealt with the issue of the cultural influences on Psychoanalysis, and even fewer have highlighted its derivation from the Jewish culture and religion. In this presentation I will try to address how the Jewish culture has influenced the life, the personality, the work and the character of Sigmund Freud, how Psychoanalysis spread across Europe following specific ethnic paths, and which psychoanalytic constructs are, in my opinion, more closely related to the traditional Jewish cultural conceptualization of life and of the human being's nature.

THE MYSTICAL ROOTS OF PSYCHOANALYSIS

INSTITUTIONS
1. University College London, Centre for Behavioural and Social Sciences in Medicine, Charles Bell House, 67 Riding House Street, London WC1 7EY, United Kingdom

AUTHORS
1. Simon Dein1, Dr, MD, s.dein@ucl.ac.uk

Psychoanalysis is traditionally seen as a secular discipline. However there is evidence that Freud was indirectly influenced by the Lurianic Kabbalah and the Zohar. Building upon the work of Bakan, I draw parallels between Freud’s concept of free association and Rabbi Abraham Afuleia’s notion of “Jumping and skipping”. Psychoanalysis is compared with the hermeneutic tradition of the Talmud. Both can be seen as depth psychologies. The metaphor of excavation can be usefully applied to both. Likewise I compare Melanie Klein’s concepts of introjection and projection with the Kabbalistic notion of the tikkun - the act of liberating the divine light or energy and restoring it to the services of the infinite God. A comparison is made between the psychoanalytic process and the encounter between the Rebbe and his followers in Hasidism. What is the relationship between the transference in psychoanalysis and the Unio mysticaein Judaism?

THE INFLUENCE OF JEWISH CULTURE ON CULTURAL PSYCHIATRY

INSTITUTIONS
1. Brown University, Butler Hospital, 345 Blackstone Blvd 02906, Providence, RI, United States

AUTHORS
1. Ronald Wintrob, Prof, MD, rwintrob@earthlink.net

For centuries, Jewish culture has been concerned in a fundamental way with minority status, with prejudice and discrimination, and with perseverance in the face of adversity. Within the field of medicine, psychiatry and psychoanalysis have had a similar history of marginalization; seen as different, strange, less than the equal of other medical specialties. In this context of the culture of medicine, cultural psychiatry can be seen as a minority within a minority, and one of its main concerns is the greater understanding and acceptance of differences between people of diverse racial, ethnic, social class and religious backgrounds.

In this presentation I address these themes as they have influenced the personal lives and the contributions to Cultural Psychiatry of several luminaries of our field: Freud, Erikson, Kardiner, Coles and Wittkower. I will attempt to assess the significance of these themes in their theoretical and clinical contributions. Finally, I will reflect on the impact of these themes, and personalities, on my own career development, in the hope that others will add to the discussion with their experiences; thereby deepening our understanding of this seldom considered, but important subject.

A 30 YEARS FOLLOW-UP: THE PSYCHO-SOCIO-CULTURAL INTEGRATION OF AN ETHNIC SUBGROUP IN AUSTRIA

1. Psychiatric Hospital, University of Vienna, Waehringer Guertel 18-20, A-1090, Vienna, Austria

AUTHORS
1. Alexander Friedmann, Dr, MD, alexander.friedmann@meduniwien.ac.at

Around 3000 Jews from (former) Soviet Union migrated to Austria between 1970 and 1990. The local Jewish community, comprising of 7500 individuals, was faced with the problems of the newcomers. Several important social, cultural and religious differences, as well as differences in rites and customs, seemed to be obstacles in the integration of the immigrants into the local community, itself overaged and burdened by financial problems. Nevertheless, the Jewish community found its own calculated means to solve these problems. In this paper, the story of the integration of the Soviet Jews in Austria is illustrated from the perspective of social and cultural psychiatry through a 30 years follow-up, in order to show the relationship between migration as manifold pathogenic stress and protective measures to cope with it, thus indicating methods for psychosocial and cultural integration. The question as to whether these means and methods, based on Jewish ethics and used in this process, could be a formula for solving contemporary migration problems, is to be discussed.

Anorexia nervosa is a major public health problem which becomes self-perpetuating when weight falls to a critical level due in part to apparent metabolic and neurocognitive impediments to weight gain.

Aims: To examine the relationship between energy metabolism, brain chemistry and neurocognition in AN at low body weight and after treatment resulting in 5-10 kgs weight gain.

Methods: Ten female anorexics were compared to lean healthy, matched controls. Aspects of energy metabolism were examined including calorimetry after glucose and exercise, insulin sensitivity, satiety peptides and quantification of visceral and abdominal fat. Proton magnetic resonance spectroscopy (H1-MRS) at 3T was used to quantify brain chemistry with concomitant neurocognitive testing. Results: Increased sensitivity to insulin was seen in AN with increases in abdominal and visceral fat. Fat oxidation was not suppressed during moderate exercise and diet-induced thermogenesis and respiratory quotient after glucose were increased with apparent energy wasting as putative effects of fat restoration. Increased choline ratios on brain H1-MRS and impaired concentration were demonstrated at low weight and during starvation, with correction during nutritional rehabilitation.

Conclusions: In AN at low weight, fat may be mobilised from brain myelin to meet energy requirements whilst being resynthesised but oxidised inappropriately during exercise. Difficulties in concentration are temporally related to MRS changes and ameliorated by prolonged nutritional rehabilitation as are the metabolic changes. Unlike the situation with glucose in situations of starvation, the brain yields up fat to its own detriment leading to self-perpetuation in AN.
ENHANCED RESPONSE OF GHRELIN TO SHAM FEEDING IN PATIENTS WITH ANOREXIA NERVOSA

INSTITUTIONS
1. University of Naples SUN, Department of Psychiatry, Naples, Italy

AUTHORS
1. Palmiero Monteleone¹, Prof., MD, monteri@tin.it
2. Cristina Serritella¹, Dr., MD
3. Pasquale Scognamiglio¹
4. VassilisMartiadis¹, Dr., MD
5. Mario Maj¹, Prof., MD, majmario@tin.it

Objectives: Ghrelin, a recently discovered hormone secreted mainly by the stomach, has been shown to act as a hunger stimulating factor. Indeed, plasma ghrelin levels rise shortly before and fall shortly after meals. The appetite stimulating effect of ghrelin has been postulated to be mediated by vagal afferent pathway, which promotes ghrelin increase in the cephalic phase of digestion. High levels of vagal activity have been associated with eating disorders, especially with binge-purging subtypes. Therefore, we decided to assess whether in patients with anorexia nervosa binge-purging subtype (AN-BP), the secretion of ghrelin in the cephalic phase of digestion was enhanced as compared to healthy controls.

Methods: One method to assess the cephalic phase of vagal function is to investigate ghrelin secretion in sham feeding condition, where subjects think about meal, smell a meal, and chew a meal but not actually swallow the meal. We measured plasma ghrelin levels in 10 women with AN-BP and 10 healthy women before and after a sham feeding test.

Results: Baseline plasma ghrelin levels were significantly higher in patients than in controls. After the sham feeding test, ghrelin levels significantly raised in both patients and controls; however, sham feeding-induced increase in plasma ghrelin concentrations was significantly higher in the former.

Conclusions: These findings confirm that the cephalic phase of vagal function is enhanced in AN-BP patients. The abnormal secretion of ghrelin in this feeding phase may represent a biological mechanism aiming to counteract the patient’s attempts to restrict food intake, precipitating sometimes binge eating episodes.

SUSCEPTIBILITY GENES FOR ANOREXIA AND BULIMIA NERVOSA

INSTITUTIONS
1. Weill Cornell Medical College, Psychiatry, White Plains, United States

AUTHORS
1. Katherine A Halmi¹, Dr., MD, kah29@cornell.edu

Anorexia nervosa (AN) and bulimia nervosa (BN) have a significant genetic component. The Price Foundation Collaborative group conducted a genome wide linkage analysis of 192 families with one affected pair with AN and 365 families with one BN. For AN, the highest multipoint NPL score was 3.03 at marker D1S3721 on chromosome 1p suggesting presence of an AN-susceptibility locus. For BN, significant linkage was present at chromosome 10p13. An analysis using two psychological covariates, drive-for-thinness and obsessionality, identified with AN, produced a significant signal for linkage on chromosome 1 at D1S1660. Quantitative trait locus (QTL) linkage analysis was conducted on 6 traits for the BN and AN affected pairs. For BN, there were suggestive signals for age at menarche at 10p13 and anxiety at 1q31 and with covariance-based linkage significance for BMI, 4q21. For Concern for Mistakes 16p13, 14q21, 14q21. QTL linkage for AN pairs had a suggestive linkage for obsessions at 6q21 and anxiety at 9p21. Covariate based linkage analysis showed only suggestive signals for BMI at 4q13, for concern over mistakes 11p11 and obsessive thoughts at 17q25. Overlap between the AN and BN cohorts was minimal. In the AN probands, association and transmission disequilibrium was investigated at 7 singe-nucleotide polymorphisms (SNPs) of the gene DRD2. Significant association of the -141 Indel in haplotype transmission disequilibrium and haplotype case control with AN suggests genetically transmitted variation in D2 dopamine receptor expression mediated by functional polymorphisms affecting transcription and translation efficiency may produce a vulnerability to AN.
PSYCHOLOGICAL AND GENETIC ASPECTS OF DELIBERATE SELF-HARM IN EATING DISORDERS

INSTITUTIONS
1. Roseneck Hospital, Prien, Germany
2. Department of Psychiatry, University of Munich, Department of Psychiatry (LMU), Munich, Germany

AUTHORS
1. Manfred M. Fichter¹,², Prof. Dr., MD, MFichter@schoen-kliniken.de
2. Nadine Bachetzky¹, Mrs., Dipl.-Psych.
3. Brigitta Bondy¹, Prof. Dr., MD
4. Norbert Quadflieg³, Mr. Dipl.-Psych.

Deliberate self-harm occurs in many psychiatric disorders. Among eating disordered patients, it is quite frequent. There is only limited data on the etiology, motives and psychological correlates of this behavior. The aim of our study was to compare eating disorder patients with and without deliberate self-harm behaviors. We also assessed further variables such as impulsivity, personality disorders, history of physical and/or sexual abuse and genetic markers of relevant neurotransmitter gene locations.

Method: 200 female patients with anorexia or bulimia nervosa with (N=100) or without (N=100) deliberate self-harm behaviors were assessed using expert interviews (SIAB-EX, SKID II, Interview about Self-Harm Behaviors, Interview on Physical & Sexual Abuse) and questionnaires (e.g. EDI-2, SCL-90 etc.). Assessments concerning molecular genetics were performed using standard methods such as PCR, real-time PCR or through sequencing.

Results: At the time of the presentation of this paper final analyses will be finished. Current analyses on 146 cases showed higher levels of impulsivity, aggressiveness and more frequent borderline personality features in those showing self-harming behavior. Genetic analyses showed an association with the polymorphism of the mono-amino-oxidase A with eating disorders and with self-harming behaviors in comparison to healthy controls.

A symposium proposed by the Section for Education in Psychiatry

This symposium will bring together speakers from around the world to examine the process of ‘psychoeducation.’ We will consider how it is defined, its use in routine mental health settings, in palliative care and in schizophrenia, and evidence about its provision and effectiveness.
PSYCHOEDUCATION WITH FAMILIES AND PATIENTS IN PALLIATIVE CARE

INSTITUTIONS
1. University of Buenos Aires, Department of Psychiatry, Buenos Aires, Argentina

AUTHORS
1. Fahrer Rodolfo¹, Professor, fahrer@ciudad.com.ar

In recent years, the importance of psychoeducational work with families and patients with terminal illness such as cancer has been increasingly recognized. Providing support and information for families result in reducing stress and burn-out levels, as well as being a valuable means to assist relatives directly. After a long illness, caregivers report poor social, physical and emotional functioning, and families complain about roles, communication and affective involvement. Psychoeducation was originally conceived as a group of several therapeutic elements within a complex family therapy. It has now evolved into an independent therapeutic program with focus on skillful communication of key information within the framework of a cognitive-behavioral approach. Our experience is based on a Program of Psychoeducation with families and patients in palliative care.

PSYCHOEDUCATION OF FAMILIES OF MENTAL PATIENTS

INSTITUTIONS
1. Ibn Rushd University Psychiatric Centre, Casablanca, Morocco

AUTHORS
1. Driss Moussaoui¹, Professor, psych@menara.ma

Psycho-education of mental patients and their families is an essential ingredient in a good outcome of management of mental disorders. This is why we started about 10 years ago a weekly meeting, every Thursday, with the families of hospitalized patients in the Ibn Rushd University Psychiatric Centre in Casablanca.

A brief presentation is made by one of the academic people of the centre about mental disorders, their prevalence in Morocco, their “causes” and their treatment.

Cultural interpretations of symptoms and causes of mental disorders are discussed with the families. Of particular importance is the highlighting of the importance of compliance of the patient, and how to deal with refusals of patients to take their medications. Another specific aspect is to make very clear that bribery, which represented a major problem among nurses in the centre, is not acceptable and should be fought in partnership between the families and the leadership of the centre.
PSYCHOEDUCATION IN SEVERE MENTAL ILLNESS: SURVEY OF ALL PSYCHIATRIC INSTITUTIONS IN CENTRAL AND EASTERN EUROPE

5. Lydie Fialova

During the last 18 years the mental health care in the Central and Eastern Europe (CEE) is under reform as a result of recent political changes. In mental health systems of these countries there are similarities, such as: the systems are underfinanced, the care is concentrated to large psychiatric institutions, with almost no community mental health facilities. Psychoeducation for severe psychiatric illnesses, mainly for schizophrenia, is generally accepted by psychiatrists and mental health workers, but is not systematically provided. In order to promote psychoeducation implementation into clinical practice on a large scale in CEE it is necessary first to map to what extent and for what diagnoses psychoeducation is provided (to investigate the percentage of persons that took part at psychoeducation programs - patients and family members - in 2007) as well as to explore possible critical areas that hinder from psychoeducation dissemination (such as financing, leadership, training and quality). The study population is represented by all mental health facilities in the Czech Republic, Slovakia and Romania, the general managers of those facilities and the moderators of psychoeducation programs conducted in those facilities. Data are collected through postal survey with additional personal or telephone interviews, and focus groups with moderators of psychoeducation programs. In Romania, application of patient or family psychoeducation in routine settings where patients with severe mental illness are usually treated has been limited, reflecting attitudinal, knowledge, practical, and systemic implementation obstacles. Proposed strategies for overcoming those barriers will be described.

PREDUKA: PATIENT AND RELATIVES EDUCATION PROGRAM FOR SCHIZOPHRENIA: ONE-YEAR OUTCOMES ON PSYCHOPATHOLOGY AND QUALITY OF LIFE

Successful long-term schizophrenia management should aim at delivery of information about the disease, treatment adherence support, cognitive decline prevention and family atmosphere improvement. We introduce clinically-based 6-week structured integrated program for out-patients with schizophrenia-spectrum disorders in the stabilization phase of the treatment. It consists of lifestyle improvement intervention, social skills training, cognitive remediation and information technology aided relapse prevention program. The cornerstone of group day-treatment program is the psychoeducational program PREDUKA (Patient and Relatives Education) which integrates detailed explanation of neurobiology of psychotic symptoms development and practical information on illness management. Didactic materials consist of powerpoint presentations and workbooks. Relatives participate in a one-day workshop. To assess the feasibility and effectiveness we designed one-year prospective follow-up field study. Preliminary analyses (N=71; first episode N=29) on baseline and 6-week outcomes data on psychopathology (PANSS) and quality of life (Schwartz Outcomes Scale-10, WHO-QOL BREF and Social Integration Survey) showed significant improvement in PANSS total score and all PANSS domains scores. Compared to healthy controls quality of life was lower in patients including those with first episode. Immediately after the program quality of life improved significantly; in Group activities, Appropriateness and Hygiene domains reached normal controls. Our short-term data suggest that participation at the program early after discharge is beneficial as it improves quality of life, prevents social isolation and early non-compliance and ensures continuity of care. One-year outcomes data will be presented.

Should schizophrenia be reclassified or renamed? In the course of the revision of the international psychiatric classification systems DSM-IV and ICD-10, a vivid discussion has started about “deconstructing psychosis”. In the context of this discussion, the Kraepelienian dichotomy between “dementia praecox” and affective disorders has been questioned, mainly because of clinical and genetic evidence indicating large overlaps between both diagnostic categories. In this symposium jointly organised by the WPA Section on Schizophrenia and the German Society of Psychiatry, Psychotherapy and Nervous Disorders, we will review neurobiological evidence regarding schizophrenia research and in how far such findings may serve as an evidence-based impetus to reclassify “schizophrenia” now, especially regarding dimensional classification criteria. We will discuss functional approaches in the classification of psychiatric disorders and how they may be applied to schizophrenia. Finally, we will discuss the applicability of the emerging WPA’s innovative Person-centered Integrative Diagnostic model to current nosological formulation of schizophrenia and how it may enhance the clinical utility of future revisions of international classification systems.

IS THE NEUROBIOLOGY OF SCHIZOPHRENIA HELPFUL TO RECLASSIFY SCHIZOPHRENIA?

1. Peter Falkai¹, Professor Dr., MD, dreich@gwdg.de

Molecular genetic and brain imaging studies have yielded a large amount of interesting data, which seem to suggest that schizophrenia is not a circumscribed disease entity but that there is a huge overlap to other psychotic illnesses. It is suggested that psychopathological domains like regulation of affectivity, cognitive dysfunction or positive symptoms are characterised by a distinct neurobiological phenotype. Furthermore it is explored whether the endophenotype concept is helpful to bridge the gap between neurobiological findings and the risk genes currently described for psychotic illnesses. In conclusion the presented paper tries to make a plea for reclassifying schizophrenia on the basis of current neurobiological findings.
THE NOSOLOGY OF PSYCHOSES: CATEGORIES, DIMENSIONS AND PROTOTYPES

INSTITUTIONS
1. The University of Western Australia, School of Psychiatry and Clinical Neurosciences, Perth, Australia

AUTHORS
1. Assen Jablensky¹, Prof., MD, assen@cyllene.uwa.edu.au

Being descendants of the Kraepelinian nosology, DSMIV and ICD-10 rely largely on the internal cohesion of the clinical picture and the pattern of course and outcome as validating criteria of the definitions of mental disorders. The majority of the research diagnostic criteria remain provisional and should be extensively tested against theoretical models and empirical evidence. The crucial issue is whether psychiatric disorders as currently defined in DSM-IV and ICD-10 are clearly separated from one another and from normality. Options for future versions of the classifications include categorical typologies, dimensional models and empirically derived prototypes. The advantages and disadvantages of each option are outlined, highlighting the need for new research focusing on these critical issues.

FUNCTIONAL APPROACHES TO THE CLASSIFICATION OF SCHIZOPHRENIA

INSTITUTIONS
1. Heinrich-Heine-University Duesseldorf, Psychiatry and Psychotherapy, Duesseldorf, Germany

AUTHORS
1. Wolfgang Gaebel¹, Professor, MD, wolfgang.gaebel@uni-duesseldorf.de

Current classification systems of mental disorders like ICD-10 or DSM-IV use operationalized criteria spanning a large range of sources of information. While these classification systems proved useful to enhance the communication between psychiatrists and helped to reduce formal ambiguities, they may have been less useful for research purposes. In schizophrenia research, for example, the „lumping together“ of different etiologies may have diluted associations with genetic risk factors in epidemiological studies. Genetic evidence suggests that certain genetic variations may predispose individuals carrying such risk alleles to a „psychotic phenotype“ crossing traditional diagnostic boundaries. This has led to suggestions to „deconstruct psychosis“ or to abandon the term schizophrenia altogether. We propose a novel classification system employing neuromental functions and their psychophysiological substrates regarded as modules of the nervous system as an alternative basis of psychiatric classification. Such a system is founded on philosophical considerations about the functioning of the human mind and neuroscientific evidence about functional subspecializations in the human cerebral cortex. It may provide advantages for research purposes. The pros and cons of such a system of functional psychopathology for the classification of schizophrenia will be discussed.
RECLASSIFYING SCHIZOPHRENIA AND PERSON CENTERED INTEGRATIVE DIAGNOSIS: TOWARD A CLINICALLY USEFUL APPROACH

INSTITUTIONS

AUTHORS
1. Ihsan M. Salloum¹, Professor, MD, MPH, isalloum@med.miami.edu

The Person-centered Integrative diagnostic model (PID) is being developed within the World Psychiatric Association (WPA) initiative's Psychiatry for the Person. The PID involves an innovative model that intends to provide the informational basis for person-centered integration of health care with the goal of maximizing care and health restoration. The PID is both a formulation and a process that engages the interactive participation of clinicians, patients, and families and employs all relevant descriptive tools (categorization, dimensions, and narratives), in a possibly multilevel structure. This presentation will discuss the applicability of this model as applied to current and proposed nosological formulation of schizophrenia.

A symposium proposed by the Section for Education in Psychiatry

This session, jointly organised by the Sections on Education and Prevention is concerned with how we educate the 'public' about the concepts of mental health promotion and prevention of mental illness. How do we explain and challenge what is understood by the different terms 'psychiatry', 'prevention', 'health promotion' and 'public education' in conversation with the general public? Who does what for and with the general public, where and how, with what kind of motivation? What methods are being used in different countries to raise awareness of these issues amongst lay people (decision makers, educators, mental health advocates, psychiatric service users and the broader general population). How are we engaging mental health professionals in this work? This symposium will explore these questions with examples from different continents and settings.
PUBLIC AWARENESS OF MENTAL HEALTH AMONGST POLITICIANS AND POLICY MAKERS

INSTITUTIONS
1. University of London, Institute of Psychiatry, London, United Kingdom

AUTHORS
1. Rachel Jenkins¹, Professor, r.jenkins@iop.kcl.ac.uk

Public awareness of mental health issues amongst politicians and policy makers is crucial as they are in key positions to be able to influence mental health for good or ill within their countries. They are key in determining whether policies get accepted or rejected, whether mental health is integrated into other policies or not, and whether the key logistical issues surrounding mental health are well understood or misunderstood, with problematic consequences. Unlike other subject areas there is also the vexed issue of stigma and discrimination, which feeds on a lack of awareness and understanding, and false information. Opportunities for improving awareness of mental health amongst politicians and policy makers are multiple, and range from proactive use of policy meetings, to use of the media, carefully worded parliamentary questions, to inviting them to present at conferences and writing their speech for them, to organising social parties where they meet key experts and representatives who are able to present their experiences in a brief but effective manner. Politicians and policy makers are extremely busy and it is common to have to do a complex briefing in 5-15 minutes, and so preparation is crucial so that key messages can be transmitted. Continuity is helpful to sustain the dialogue and build on increasing awareness, but of course, of politicians change regularly, and so then the task has to be started again. This talk will describe key opportunities, methods and challenges in raising awareness of mental health in politicians and policy makers.

SEARCHING FOR WAYS TO IMPROVE MENTAL HEALTH AWARENESS IN THE COMMUNITY

INSTITUTIONS
1. Kocaeli University, Community Mental Health Research and Training Center, Kocaeli, Turkey

AUTHORS
1. Bulent Coskun¹, Dr, 8bulentcoskun@gmail.com

Community Mental Health Research and Training Center of Kocaeli University is running mental health awareness programs for the public since 1999 earthquake in the region. An innovative approach to discuss interpersonal and intra-familial issues without going into the details of the personal histories was developed (1). Clips from popular films and TV serials are utilized to open up the discussions on predetermined topics. The aim of the meetings is explained as an exercise to raise awareness about interpersonal interactions both in the families and in different settings in the community. Behaviours of the characters in the clips, meanings attributed to small details in their behaviours and words are all discussed together with the participants.

Main problem is about motivating the general public to get involved in these activities. It is thought that the people who attend these meetings are already motivated but the people who do not think much on the consequences of their behaviour and their words are not aware and sometimes ignorant about such efforts.

During the symposium, it is expected to get views and suggestions from other experts, regarding their observations and experiences in public awareness activities.

EDUCATING THE PUBLIC ABOUT MENTAL ILLNESS: THE TEMPLE UNIVERSITY PROGRAM

INSTITUTIONS
1. Temple University School of Medicine, Psychiatry, Philadelphia, United States

AUTHORS
1. David Baron¹, Professor, dbaron@temple.edu

Diagnosing and treating mental illness is a global public health issue. The ongoing stigma towards psychiatric illness results in added suffering for patients and significant added expense to individuals and government health agencies. Educating the public about mental health and addictive disorders, at a grass roots level, is an effective way to address this problem. Temple University, a large inner-city University in Philadelphia, PA in the US, has ongoing community education programs dealing with health and mental health. Topics include; dealing with stress, caring for elderly family members, depression, anxiety, ADHD, drug and alcohol use/abuse, relationship issues, surviving living with an adolescent, and others.

The goal of this program is to educate the community on differentiating normal reaction from psychopathology, treatment options, and address many of the myth's concerning psychiatric disease. This presentation will provide an overview of this program, highlighting critical issues related to its success. The need for cultural sensitivity and understanding the unique needs of the community will be presented. Finally, the need for psychiatrists to play an active role as educators in the community and how to train our colleagues to be effective teachers at this level will be addressed.

THE PRACTICE OF PROMOTING MENTAL HEALTH AND PSYCHOSOCIAL WELLBEING

INSTITUTIONS
1. University of Melbourne, Psychiatry, Melbourne, Australia

AUTHORS
1. Helen Herrman¹, Professor, h.herrman@unimelb.edu.au

Together with expanding services to those who at present receive none, prevention of mental disorders and promotion of mental health make critical contributions to population mental health in all parts of the world. Recent efforts of the World Health Organization (WHO) include international reviews of scientific evidence for these interventions, dissemination of the evidence in all countries, more particularly within the lower and middle income groups, and assisting governments and non-governmental organisations to use the evidence in developing programmes and activities.

WHO has recently published two international Reports on these topics now available in print versions and on the WHO website[1]. Prevention of Mental Disorders: Effective interventions and policy options and Promoting Mental Health: Concepts, emerging evidence, practice. These Reports highlight the need for collaboration between health and non-health sectors in promoting mental health and psychosocial wellbeing. One of the serious limitations in developing this collaboration is the lack of clear and specific guidance on the practice of promoting mental health. The paper will describe a project to develop a guidance package that will be useful to those working with sectors outside as well as within the health field.

Risk factors for suicide can be organized in a framework that conceives genetic and environmental influences and their interactions. A genetic predisposition towards suicidal behaviour has been well established by family, adoption and twin studies. Environmental influences associated with suicide comprise a wide range of risk factors, including a variety of life events, traumatic experiences and social predisposition. The complex interaction between genes and environment in determining vulnerability to suicidal behaviour will be discussed during the symposium. The speakers will present recent findings about molecular genetics studies on suicidal behaviour and psychopathological factors associated with suicide. The concept of suicidality and the definition of suicidal phenotypes will also be discussed.

INTERACTION BETWEEN CHILDHOOD TRAUMA AND SEROTONIN TRANSPORTER GENE VARIATION IN SUICIDE

INSTITUTIONS
1. New Jersey VA Healthcare System, Psychiatry Service, East Orange, New Jersey, United States

AUTHORS
1. Alec Roy¹, Prof., MD, Alec.Roy@med.va.gov

Although the serotonin transporter promoter polymorphism (5-HTTLPR) contributes to depression and suicidality in a fashion modulated by environmental stress, 5-HTTLPR has been little examined in relation to suicidal behavior in substance dependence. Recently, a third functional allele of 5-HTTLPR was discovered enabling more of the interindividual variation in serotonin transporter expression to be predicted by genotype. We examined whether the 5-HTTLPR gene alone, or interacting with childhood trauma, was predictive of suicidal behavior in substance-dependent patients, a clinical population that is at high risk of suicide, as well as childhood trauma and other stress. We interviewed 306 abstinent male African-American substance-dependent patients about whether they had ever attempted suicide and administered the 34-item Childhood Trauma Questionnaire (CTQ). Patients and 132 male African-American controls were genotyped to determine the S, L(G), and L(A) 5-HTTLPR alleles; some analyses grouped the S and L(G) alleles on the basis of equivalent function. The distribution of 5-HTTLPR genotypes did not differ between patients and controls, nor between suicide attempters and non-attempters. However, patients with low expression 5-HTTLPR genotypes and above-median CTQ scores were more likely to have attempted suicide. Logistic regression showed increasing risk of a suicide attempt with increasing reports of childhood trauma scores; in addition, this increase was exaggerated among those with low expression forms of the 5-HTTLPR genotype. Childhood trauma interacts with low expressing 5-HTTLPR genotypes to increase the risk of suicidal behavior among patients with substance dependence.
CRHR1 GENE IMPLICATED IN MALES WITH SUICIDAL DEPRESSION

Twin studies, adoption studies, and family studies indicate the role of genetic factors in suicidal behaviours. Psychobiological hypotheses regarding suicidal behaviours involve neurotransmitters and their correlation to psychological functions as well as the dysregulation of the hypothalamic-pituitary-adrenal (HPA) axis. Whereas the genes of e.g. the 5HT system and of the key NA-biosynthesis enzyme, tyrosine hydroxylase, have been studied extensively in this context the genes in the HPA axis have only begun to be investigated recently.

Our group was the first to study the genetic variation in the CRHR1 gene in connection to depression and stress among suicidal individuals. Our novel results suggest that genetic variation in the CRH-mediated regulation of the HPA axis is a factor of importance in males with major depression.

Results obtained from the replication analyses of SNPs in candidate genes, in 750 family trios with suicide attempter offspring, by using the transmission disequilibrium test both in a two-stages screening/repetition sample design and in detailed reanalysis in the entire sample, will be discussed.

ROLE OF BDNF GENE IN SUICIDAL BEHAVIOR: A POST-MORTEM STUDY

INSTITUTIONS
1. University of Molise, Department of Health Sciences, Campobasso, Italy

AUTHORS
1. Marco Sarchiapone¹, Prof., MD, marco.sarchiapone@gmail.com

Introduction: Brain Derived Neurotrophic Factor (BDNF) has been implicated in neuronal survival and plasticity and reported as being involved in various mental illnesses, including attempted and completed suicide. Evidence from postmortem studies has also shown an altered expression of BDNF in suicide victims brains. We previously investigated the impact of the Val66Met polymorphism of the BDNF gene in determining a suicide attempt in depressed patient and found an association between the BDNF variant and history of early maltreatment in depressed patients with suicide attempts. We then conducted a study on post-mortem brains of suicide completers and their controls to further test the hypothesis of an involvement of BDNF in suicide-related neurobiological processes.

Methods: 535 specimens of brain from subjects dead either by suicide (N=271) and by other cause (N= 261) were genotyped for the Val66Met and Prom 281 CA polymorphisms of the BDNF gene.

Results: No associations were found between either the first or the second variant of the BDNF gene and suicidal behaviour. A positive link between BDNF expression and suicidal behavior was found.

Conclusions: As the case for other candidate genes, results from genetic studies of the BDNF gene are conflicting and arduous to replicate. The epigenetics perspective could be of use in illustrating the links between genes and suicide.
GENE EXPRESSION AND GENETIC VARIATION IN POSTMORTEM TISSUE OF DEPRESSED PATIENTS

INSTITUTIONS
1. McGill University, McGill Group for Suicide Studies, Douglas Hospital, Departments of Psychiatry and Human Genetics, Montreal, Quebec, Canada

AUTHORS

Introduction
Major depressive disorder and suicide are complex phenomena on which biological factors play an important role. Parallel screening of gene expression alteration of thousands of genes makes it possible to investigate, at the genomic level, complex disorders and gain insight into biological mechanisms mediating risk. The goal of my presentation will be to present data suggesting that the polyamine system plays a role in major depression and suicide.

Methods
Brain gene expression analysis using the Affymetrix HG-U133 chip-set A and B was performed using RNA isolated postmortem from 17 cortical and subcortical brain regions from 46 male subjects, including suicides with and without major depressive disorder and normal controls. Follow up studies were carried out by means of RT-PCR, immunohistochemistry and western blotting. Genetic variation studies were carried out in a sample of suicide completers from the general Quebec population and matched controls.

Results: Our initial studies implicated SSAT in suicide and major depression. Follow up studies validated a downregulation of this gene. Subsequent studies in additional samples confirmed our initial results and indicated global brain alterations of SSAT and other components of the polyamine system.

Conclusion: Polyamines constitute an interesting candidate system in depression and suicide. Additional studies should be carried out to better characterize and replicate our findings.

Currently there is an ongoing debate regarding the efficacy of mental health promotion and suicide prevention programmes for children and adolescents. Literature shows that some approaches have been researched extensively while others have had very little research evaluation. These include: Awareness curriculum - educational programmes for students, teaching about mental illness and suicide prevention; Gatekeepers programmes - training school staff on how to recognise and refer a student at-risk of suicide to help resources, how to help students with depression, problem behaviour and social adjustment problems; Screening at-risk students - referral and treatment by mental health professionals; Skills training - emphasizing the development of problem-solving, coping, and cognitive skills, because youths suffering mental health problems and suicidality have deficits in these areas; Peer helpers - the rationale underlying these programmes is that youths are more likely to confide in a peer than an adult; Promotion of mental health through awareness campaigns to the public - the rationale in these programmes is that informing the public about the nature, magnitude and treatment of children's mental health will facilitate early identification and treatment of children with mental health problems. During the symposium, the state of the art and current issues in youth suicide prevention will be illustrated.
PREVENTIVE PROGRAMMES IN SCHOOLS

INSTITUTIONS
1. Euro RSCG Life, France
2. National Prevention of Suicide and Mental Ill-Health (NASP) at Karolinska, Italy

AUTHORS
1. Veronique Narboni
2. Danuta Wasserman

Youth suicide rates, especially among males, constitute a major public health problem in Europe.

Although suicides among young people aged 15-24 constitute a considerable burden on the society, the approach of initiating prevention at a very early stage of the suicidal process is scarcely applied. Intervention is much more difficult once the suicidal process has progressed beyond a certain stage. Therefore, suicide preventive programmes should be tailored in close collaboration with staff working in schools, as many children in the world attend compulsory school.

The WHO's world wide initiative to prevent suicide has published a resource series, and among them a resource for teachers and other schools staff on how to prevent suicidal behaviours and strengthen mental health among pupils. Experiences from using this material will be presented.

SAYLE: PROMOTING HEALTH THROUGH THE PREVENTION OF RISK-TAKING AND SELF-DESTRUCTIVE BEHAVIOURS

2. Marco Sarchiapone
3. Vladimir Carli

There is no health without mental health (WHO, 2005): this means that health promotion programmes should also include mental health promotion components.

Preventing risk-taking behaviours is in direct connection with mental health promotion. The ultimate outcome of unhealthy behaviours is attempted suicide and suicide. Scientific evidence shows that suicide and risk-taking behaviours can be prevented. Serious health and safety issues such as motor vehicle crashes, violence, substance abuse, and promiscuous sexual behaviours adversely affect adolescents and young adults. Not eating nutritiously, not engaging in physical activity, and choosing alcohol, drugs and tobacco increase the risk of developing health problems in adulthood. Therefore theses behaviours, which are associated with high mortality and morbidity, remain a major problem among adolescents and need to be prevented. In this presentation a research program will be described that will assess the effects of three different health promoting / suicide prevention programs in a large sample of high school students across eleven European countries:

1. A general health promotion program targeting students' awareness on healthy/unhealthy behaviours and students' self-efficacy in diminishing unhealthy behaviours;
2. TeenScreen - screening by professionals of at-risk students through a questionnaire. For adolescents identified as high risk (screen positives) the program includes referral to mental health treatment and ensuring compliance.
3. QPR (Question, Persuade & Refer) – a gatekeepers' program, training all adult staff at schools (teachers, counselors, nurses etc.) and parents on how to recognize & refer a student with risk-taking behaviours or suffering from mental illness to mental-health help resources.
EXISTING APPROACHES TO SUICIDE PREVENTION IN YOUNG PEOPLE - STRENGTHS AND WEAKNESSES

INSTITUTIONS
1. Columbia University, College of Physicians and Surgeons, United States

AUTHORS
1. David Shaffer

Goals: To review the relative benefits and costs of the more commonly used approaches that have been recommended or tried to prevent suicide in adolescents.

Methods: The presentation will include mention of the problems in evaluating the efficacy of an intervention to reduce the incidence of an uncommon condition. We have little knowledge about how to modify the factors that lead to the development of high-risk conditions. Methods that will be discussed include enhancing problem-solving skills; promoting participation in treatment through case-finding, either by education or by direct screening; encouraging the use and provision of appropriate interventions with professional education and destigmatization programs; modifying the environment during moments of suicide intent by method control; influencing media on how to minimize the risk of provoking suicidality; and developing crisis services when the urge to commit suicide is at its most intense.

These methods will be discussed with reference to their effectiveness, cost, and downside potential through labeling and/or paradoxical effects.

Conclusions: Primary prevention is not currently an option. Broad mental-hygiene approaches, including training in coping skills and enhancing emotional regulation, remain controversial and unproven. Method control and crisis intervention address the moments of acute suicidality, but we need to know more about whether a youth in that state can take advantage of those interventions. I will conclude that case-finding and appropriate treatment are the most conservative, but most promising, avenues for youth suicide prevention.

Data show that suicide is a serious public health issue worldwide, and needs intervention strategies at several levels in order to reduce either number of deaths by suicide and number of attempted suicides. Presentations in the symposium will illustrate the state of the art and current issues in comprehensive suicide prevention, from various and novel perspectives. A public health point of view will be discussed. Efficacy of wide programs for prevention of depression in the general population will be also debated, with the aim of examining how these strategies can affect a modification in completed and attempted suicide rates. As training of GPs remains one of the most important parts of suicide prevention strategies, the specific targets of these kind of modules, as learnt from a eastern Europe well-established project and experience will be addressed. Finally, an emerging concern on prevention of suicide among a high risk group such as subjects with mental retardation, where psychiatric disorders are often underdiagnosed and communicative skills with physicians are poor, will be also considered and debated. Symposium will be preceded by an Opening Lecture by Prof. J. P. Soubrier on Print Media and Suicide.
HOW EVIDENT IS EVIDENCE IN SUICIDOLOGY? CHALLENGES IN SUICIDE PREVENTION FROM A PUBLIC HEALTH PERSPECTIVE

INSTITUTIONS
1. Uppsala University Hospital, Division of Psychiatry, Uppsala, Sweden
2. Coburg University, Faculty for Social Sciences, Coburg, Germany

AUTHORS
1. Wolfgang Rutz\textsuperscript{1,2}, Prof., MD, PhD

Context:
Suicidology and suicide prevention has a complex nature involving all aspects of the human condition and the human persona and demanding complex interactive and synergistic societal strategies. The evidence, needed to be the base for suicide preventive program, is by natural reasons often complicated by problems of heterogeneity, by problems in explaining multi-factorial causality by mono-causal mechanisms, by a statistical lack of power as well as the absence of subjectivistic approaches that take e.g. gender and other specific differences between and within risk populations into consideration.

Key Messages:
Evidence finding and strategy development within the field of suicidology has to include scientific research and methodological development “for the person”. Epidemiologically, some conventionally claimed statistical methods and orthodoxies should be problematized, and qualitative, individualized evidence in individual settings be given greater importance. Examples will be given and consequences discussed.

Introduction: A prevention campaign to decrease the rate of suicides was initiated in 2002 and was fully operating by mid-2003. This has been a collaborative effort within the European Alliance Against Depression. We compare results based on suicide rates 1999-2002 with the same in the years 2003-2006.

Method: The prevention campaign consisted of nationwide workshops and Train the Trainers workshops for primary health care and community facilitators; CBT courses for GPs; education and better access to emergency services high-risk groups; and awareness campaigns for the general public. Outcome evaluation assessed suicide four years before and after the initiation of the program.

Results: The suicide rate decreased from 13.0/100.000 in the years 1999-2002 to 10.9/100.000 (p<0.01) in the years 2003-2006, calculated as a preventable fraction or increase. The decrease was highest in males, particularly in those 24 years and younger, from 24.1/100.000 to 14.1/100.000. No significant changes were observed in the female population.

Discussion: The suicide prevalence has decreased significantly during the four years in which the campaign has been operating. It is debatable whether the decrease is real, and if so, whether it can be attributed to better diagnosis and treatment, increased public awareness and increased support for the ill, improved social conditions, or to some other unforeseen factors.

GPS TRAINING AS A KEY COMPONENT OF NETWORK BUILDING AND SUICIDE PREVENTION STRATEGY DEVELOPMENT (UKRAINIAN EXPERIENCE)

INSTITUTIONS
1. Odessa National Mechnikov University, Human Ecological Health (NGO), Odessa, Ukraine

AUTHORS
1. Vsevolod A Rozanov

In Ukraine (like in majority of the new independent states emerging after fall of the USSR), suicide prevention is widely referred as a task for professional psychiatric community. No surprise that when NGO uniting different medical and non-medical specialists started suicide prevention seminars for GPs community in 1999, it attracted much attention. Combination of several positive factors provided for consistent activity during 8 years and led to suicide prevention Network development and formulation of the proposal for Ukrainian National Suicide Prevention Strategy. Training of GPs remains one of the most important parts of the Strategy and current activity which makes the whole initiative attractive both for wide medical circles and authorities of different levels. So, lessons learnt from a project aimed to introduce international experiences and develop National-based initiatives in suicide prevention are:

1) current education of GPs in Ukraine does not pay enough attention to suicide prevention;
2) training in suicide prevention is accepted by GPs in Ukraine with sincere interest;
3) GPs training is not only knowledge dissemination but also network building source;
4) GPs training is part of the strategy that is best accepted by medical authorities which can provide for further dialogue and more systemic change;
5) GPs training is the basic component of unification of medical and psychological educators, governmental and public forces within the frame of teaching centers, like one built in Odessa by NGO and state University.

SUICIDAL BEHAVIOUR IN PERSONS WITH MENTAL RETARDATION

INSTITUTIONS
1. Thriasio Hospital, Department of Psychiatry, Athens, Greece

AUTHORS
1. Kostantinos Paplos, MD, kpaplos@med.uoa.gr

Suicide prevention is a health priority since suicide is a major cause of mortality and attempted suicide a significant cause of morbidity. Strategies for suicide prevention have focused on management, including, assessment of risk and appropriate interventions, for suicidal patients or other high-risk groups in primary care settings. It has been estimated that about half of persons who committed suicide had contacted their general practitioner (GP) in the months before suicide. Individuals with mental retardation (MR) constitute a heterogeneous group of patients, with varying degrees of communication abilities and needs, higher prevalence of physical illness and mental disorders than in the general population. However, psychiatric disorders are often underdiagnosed, and low rates of suicide have been reported. This may be due to different factors such as, patient's communication impairments and limited access to health services, GP's communication skills and knowledge on the patterns of suicidal behaviours and related risk factors, making assessment and management of suicidal behaviour difficult. Furthermore, research concerning suicidality in this population is limited. In era of deinstitutionalization, relevant works has emphasised on GP's educational needs related to behavioural and psychiatric conditions in persons with MR, and their critical role in suicide prevention in the context of a multidisciplinary team.

MENTAL HEALTH UNDER WAR CONDITIONS: LESSONS FROM IRAQ

INSTITUTIONS
1. Al-Rashid Hospital - Amman, Jordan

AUTHORS
1. Ali Numan, MD

Impact of war on health is usually assessed primarily in terms of its most direct and visible effects - death and injury through conflict. The death toll among civilians in Iraq from April 2003 till now is estimated to be around half a million but accurate statistics are lacking. The risk of death by violence for civilians in Iraq is now 60 times higher than before the US-led invasion, especially in the hot areas in the country.

There are about three million people who migrated to neighboring countries because of the continued violence in Iraq.

The number of people who are in need for assistance due to mental health issues is very high, but the helping capacity is limited and can cover only a small proportion of the needs. The rate of PTSD among populations studied was between 35 -60 % and around 40% of the population has suffered from more than one trauma event in the past three years.

There are some psychosocial phenomena that appeared soon after the war, these included increased drug and alcohol misuse, high rates of organized crimes (armed robberies, kidnapping and murder) and prostitution.

The current stresses of continued uncertainty about personal security, frequent disruption of electricity, fuel and water supply will definitely lead to psychological insecurity which increases the anxiety and mood related disorders arising from the war.
CULTURE, WAR AND MENTAL HEALTH IN KOSOVO

INSTITUTIONS
1. KRCT, Pristina Kosovo, Serbia and Montenegro
2. Medical University of Vienna, Dept. Social Psychiatry, Vienna, Austria

AUTHORS
1. Feride Rushiti1, Dr., krc@hotmail.com
2. Thomas Wenzel2, Dr., Prof., drthomaswenzel@web.de
3. Bayram Maxhuni1, Dr., (krct_org@hotmail.com
4. Ferid Aghani1, Dr., krct_org@hotmail.com

The war in Kosovo can be seen as one of the most destructive events in the recent history of Europe. The long-term impact with regard to trauma and also recent stress through economical problems has created a challenge in the development of treatment structures and of a national health care plan. As the impact of the war must be seen as long lasting, and severe, if studies in comparable war regions and an earlier study of the CDC (Center of Disease Controls) are taken into account, exact data are required for long term planning. In a project founded by the Danish Refugee Council (DRC), the Kosovo Rehabilitation Center for Torture Survivors (KRCT), in collaboration with WPA experts, performed two studies to explore both qualitative and quantitative (epidemiological) aspects of posttraumatic spectrum disorders, inclusive posttraumatic stress disorder, depression and different indicators of social functioning and general health (MOS, GHQ). Based on a representative sample, 1200 people were enrolled in the study. The presentation gives an overview of the implementation and results of this study. The high rates of posttraumatic stress disorder (33 % in some regions), and depression (close to 38 % in some regions) indicate severe and persistent reactive symptoms in a substantial part of the population, with regional needs and possible factors contributing to chronicity that will be discussed in the presentation.

NON RESTORATIVE SLEEP IN THE GENERAL POPULATION IN KOSOVO

INSTITUTIONS
1. Medical University of Vienna, Vienna, Austria, Department of Neurology, Vienna, Austria
2. KRCT, Pristina, Serbia and Montenegro
3. Institute for Consciousness and Dream Research, Vienna, Austria

AUTHORS
1. Gerhard Kloesch1, Dipl.Psych., gerhard.kloesch@meduniwien.ac.at
2. Feride Rushiti1, MD, krc_org@hotmail.com
3. Bayram Maxhuni1, Dr., krc_org@hotmail.com
4. Brigitte Holzinger1, Dr., brigitte.holzinger@chello.at

Objectives: Exposure to war and its consequences includes a broad range of extreme stressors. The post-war situation in Kosovo is characterized by unprocessed trauma, splitting of families, lack of health care resources to cope with the range of trauma, and experiences of displacement and exile.

Methods: The authors analysed a recent representative survey conducted by the Kosovarian Rehabilitation Center for Torture Survivors (KRCT). The survey included the General Health Questionnaire, the Harvard Trauma Questionnaire, MOS, and the Hopkins Symptom Checklist. Data analysis is based on more than 1200 participants.

Results: Analysis of data revealed a high level of subjective complaints about sleep. About 40 - 47% of the general population in Kosovo reported poor sleep. Difficulties in falling asleep as well as maintaining sleep and early morning awakenings were present in all age groups, but most common in young Kosovars (between 15-34 years). Also recurrent nightmares were frequently reported by about 14% of the general population in Kosovo.

Conclusion: Comparison with other countries such as Austria indicates a rather dramatic increase of complaints about non restorative sleep in the general population in Kosovo. Sleep disorders with all potential sequels (e.g. depression, PTSD etc.) must be expected to be a highly common problem in post-war societies and should be attributed importance in future research.
SUICIDAL IDEATION AND SUICIDE STATISTICS IN KOSOVO FIVE YEARS AFTER THE WAR

INSTITUTIONS
1. Medical University of Vienna, Social Psychiatry, Austria
2. KRCT, Serbia and Montenegro

AUTHORS
1. Thomas Wenzel¹, Dr., Prof., drthomaswenzel@web.de
2. Feride Rushiti², Dr., krct_org@hotmail.com

Objectives:
The hostilities in Kosovo can be seen as a testing stone for the understanding of the long-term impact of complex economical and psychosocial stress. Most studies so far have been focusing on Posttraumatic stress disorder, but not on depression, hopelessness and suicidal behaviour.

Methods:
As part of a major epidemiological study, based on representative community samples the subscale for suicidal behaviour of the GHQ (Watson) was used parallel to measures of depression, PTSD and social functioning as well as social indicators.

Results:
The final sample included 1161 participants. Only 15.5% of the sample reported to be employed. 25.8% of the population had a score of 6-11, representing the presence of moderate nonspecific psychiatric morbidity, while 27.7% of the population had a score of >12, indicating the presence of substantial psychiatric morbidity.

In accordance with the general governmental statistics that indicates rising numbers of suicide attempts, suicidal ideation was common, with clear regional distribution patterns. This was demonstrated to be stronger correlated with posttraumatic stress disorder then with most other factors. Regional distribution reflected an impact and social factors.

2. University of Athens, Dept of Psychiatry, Athens, Greece

AUTHORS
1. Margit Schmolke¹, Dr., PhD, margitschmolke@aol.com
2. Vassilis Kontaxakis², Prof., MD, psych@psych.gr

The speakers of this international symposium, organized by the WPA Section on Preventive Psychiatry, are experienced psychiatrists and psychoanalysts. The symposium will focus on the meaning of specific psychosocial factors for the following areas:
PREVENTION OF PSYCHOSOCIAL DECLINE THROUGH EARLY INTERVENTIONS IN PSYCHOSIS

INSTITUTIONS
1. University of Athens, Dept of Psychiatry, Athens, Greece

AUTHORS
1. Vassilis Kontaxakis, Assoc. Prof., MD, editor@psych.gr

Psychoses are considered as debilitating and often life-threatening diseases. The development of preventive interventions in the pre-psychotic phase or in early stages of the disease is considered as very important. "Psychosis prodrome" refers to sub-threshold symptoms and signs indicating the onset of the disorder that occur before the development of symptoms that permit definitive diagnosis. Recent clinical research provides increasing support for the logic of interventions in the prodromic phase of the disease. Duration of untreated psychosis as a marker of delay in delivering effective specific treatment is a potentially important variable in improving outcome in first-episode psychosis and can become the focus of intervention strategies. Intensive phase-specific treatment in first-episode psychosis including drug-therapies as well as psychological therapies is still the most feasible proposition for most clinicians.

PREVENTIVE FACTORS AGAINST CHRONIFICATION IN PSYCHOSIS: THE ROLE OF SUBJECT’S POSITIVE HEALTH FACTORS

INSTITUTIONS
1. German Academy for Psychoanalysis, Group Psychotherapy Training, Munich, Germany

AUTHORS
1. Margit Schmolke, Dr, PhD, margitschmolke@aol.com

In recent years, there is an interesting discussion within the mental health field if disease oriented prevention of mental illness should be complemented by a more comprehensive view. Instead of being restricted to minimizing risks or resolving illnesses and disabilities, positive health oriented or “salutogenic” clinical care focuses on lifting as much as possible the level of health status of a person. These health oriented activities are now often mentioned as examples of health promotion which include e.g. activating personal and social resources, enhancement of the health of the whole individual in his context, or empowering social participation. The author will outline some positive health aspects which serve as preventive factors in persons diagnosed with schizophrenia. Some results of her qualitative study will be presented.

DEALING WITH ADOLESCENTS’ SPECIFIC DIFFICULTIES TO ACCESS TO PSYCHIC PREVENTIVE CARE

INSTITUTIONS
1. French Juvenile Judicial Protection, Direction, Paris, France

AUTHORS
1. Michel Botbol¹, Dr., MD, michel.botbol@wanadoo.fr

Many reliable epidemiologic data show that while adolescence is the time of many odds from the psychic point of view, and, as such a crucial time for psychic preventive cares, there are specific obstacles at this age to access to care in general and to psychic cares in particular. This paper will present some of these data, discuss a psychodynamic understanding of the processes leading to these obstacles and make some proposal on how to take into account these specificities and to improve these adolescents’ access to care in spite of there lack of demand.

PREVENTIVE ASPECTS IN LONG-TERM PSYCHOTHERAPY: A CASE STUDY

INSTITUTIONS
1. German Academy for Psychoanalysis, Munich, Germany

AUTHORS
1. Monika Dworschak¹, Dipl.Psych., monika.dworschak@t-online.de

In the framework of secondary prevention a case study will be described. A patient with dual diagnosis (drug addiction and personality disease) has been treated in different psychotherapeutic and community settings during the period of 10 years. The therapeutic process will be described including the context of relapses, positive turning points, and the development of a personal life perspective based on a stable therapeutic relationship.
PREVENTION OF POST-TRAUMATIC STRESS DISORDER

INSTITUTIONS
1. Ibn Rushd Psychiatric Hospital, Baghdad, Iraq

AUTHORS
1. Numan S. Ali1, Dr., MD, numanali@hotmail.com

PTSD is a common disorder that often presents with substantial psychiatric co-morbidity. There are some promising developments in its prevention.

Prevention can be primary by preventing exposure to trauma or secondary by preventing the development of PTSD immediately after exposure to trauma and tertiary prevention by preventing the worsening once PTSD has already emerged.

Not all people who are exposed to the severe traumas of war develop PTSD, which leads us to think of some susceptibility factors in people who develop PTSD like pre-existing psychiatric disorders, inadequate social support and probably some genetic predisposition.

Preventive techniques shall be discussed in some details; these include psycho-social strategies (debriefing, memory structuring intervention, CBT, & EMDR.....etc) and pharmaco-therapy (SSRI's m Beta Blockers, etc).

Exposures to single and clearly identifiable severe traumatic event afford the opportunity for early detection and follow up. But what about situations in some war zones (like what is happening in Iraq) where there are many layers of traumas which has been going on for few years?

There are some positive outcomes of exposure to trauma that should not be ignored and that people also get some form of adaptation to the new situations with high levels of resilience and cohesion within the family.

5. Jiefeng Cui1, Dr., MD
6. Jian Wang1, Dr., MD
7. Nan Chen1, Mrs
8. Dongfeng Zhou2, Dr, MD, zhoudf@bjmu.edu.cn

Objectives: Cognitive Remediation Therapy (CRT) is an effective way to improve cognitive function of patients with schizophrenia. There is two different type of CRT, one is manual CRT, another is computerized CRT. The aim of present study was to compare effective difference on improving cognitive function between two types of CRT.

Methods: A total number of 90 inpatients with schizophrenia randomly divided into three groups: manual CRT (n=36) group with 40-sessions pencil-paper CRT therapy plus usual treatment, computerized CRT group (n=36) with 40-sessions computerized CRT plus usual treatment, and control group (n=18) with therapeutic contact matched Musical and Dancing Therapy (MDT) plus usual treatment. Pre and post treatment, cognitive function using a battery of cognitive measurement and clinical symptoms using PANS were evaluated.

Results: After treatment, 32 of 36 in Manual CRT group, 29 of 36 in Computerized CRT group and 17 of 18 in control group completed study and data collected to analysis. Comparing with control group, cognitive flexibility and memory achieved a significant improvement in two CRT group. but only computerized CRT group improved executive function significantly measured by WCST test. however, there was a trend that manual CRT has advantage on improving word fluency although this difference failed to achieve a significant level. There is no significant difference in clinical symptoms pre-post treatment among three groups.

Conclusion: There is different effective pattern on improving cognitive level in patients with schizophrenia as computerized CRT have an advantage on executive function, manual CRT maybe have an advantage on word fluency.

REPETITIVE TRANSCRANIAL MAGNETIC STIMULATION (RTMS) IN SCHIZOPHRENIC PATIENTS: CLINICAL AND FMRI STUDY

INSTITUTIONS
1. Beijing Anding Hospital, Beijing, China
2. Peking University Sixth Hospital, Beijing, China
3. PLA 30 Hospital, Beijing, China

AUTHORS
1. Yanping Ren1, Dr., MD, Ph.D. renyanping@sina.com, 2. Dongfeng Zhou2, Dr., MD, 3. Zhuoji Cai1, Dr., MD
4. Zhen Jin3, Dr., MD, Ph.D, 5. Yi Jin2, Dr., MD, Ph.D

Objectives: To examine the therapeutic effects and safety of dual dorsolateral prefrontal repetitive transcranial magnetic stimulation (rTMS) on auditory hallucinations and negative symptoms experienced by schizophrenia and the influence on cognitive functions of schizophrenia. Applying fMRI technique, to investigate the brain functional features of auditory hallucinations.

Methods: Total number of 46 refractory schizophrenic patients were randomly assigned to rTMS therapy group (n=24) or sham group (n=22). PANS scales were assessed pre and post study. Patients completed a neuropsychological battery including Wisconsin Card Sorting Test and continuous performance test at baseline and after completing the study. Functional magnetic resonance imaging (fMRI) study: Seven patients from rTMS group and seven normal subjects received fMRI scanning during paragraphic listening task at baseline. And the same 7 patients who received fMRI scanning prior study performed the same scanning again post study.

Results: rTMS group revealed a significant improvement in auditory hallucination, negative symptoms, attention and executive function. Group statistic activated areas of normal group included: right superior temporal gyrus, Broadman 22; rTMS group at baseline in include: dual lateral super temporal gyrus; post-study included: right superior temporal gyrus, Broadman 22.

Conclusion: 1. It is effective for rTMS to treat schizophrenia with auditory hallucination at 1Hz and negative symptoms at 20 Hz. 2. Cognitive function of schizophrenia can be improved through rTMS treatment. 3. Auditory hallucination is associated with enhanced activation of cortex and subcortex areas including right limbic lobe, anterior cingulated gyrus and superior frontal gyrus.
IS NEUROCOGNITIVE TRAINING CAN NORMALIZE BRAIN FUNCTION OF PATIENTS WITH SCHIZOPHRENIA: A COMPARATIVE FUNCTIONAL MAGNETIC RESONANCE IMAGING STUDY PRE-POST COGNITIVE REMEDIATION THERAPY

INSTITUTIONS
1. Beijing Huilongguan Hospital, Beijing, China

3. Institute of Psychiatry, King College of London, London, United Kingdom

AUTHORS
1. Shuping Tan, Dr., MD, Ph.D
2. Zou Yizhuang, Dr., MD, PhD, yzouy@263.net
3. Wykes Til, Dr., PhD
4. Wang Jian, Dr., MD
5. Cui Jiefeng, Dr., MD
6. Chen Nan, Mrs
7. Zhou Dongfeng, Dr., MD, zhoudf@bjmu.edu.cn

Objectives: To explore the brain function changing of patients with schizophrenia after a sixth-month cognitive remediation therapy.

Methods: Ten chronic inpatients with schizophrenia in stable condition and ten demographic data matched normal subjects were recruited in the study. Patients and normal age: 39.9±5.0, 38.7±9.5; years of education: 10.6±2.0, 11.5±1.6. Course of disease (years):20.5±10.2. Patients received cognitive remediation therapy during a six-month period, and received examination of memory function and functional magnetic resonance imaging (fMRI) pre-post study. Normal subjects received same fMRI one time in this research. While proceeding blood-oxygen level dependent contrast functional magnetic resonance imaging (BOLD-fMRI), subjects performed a modified version of Sternberg Item Recognition task (remember two (low load) or five (high load) digitals simultaneous and make judgment about whether the digital presented latter is that appeared before) and direction judgment of arrows (toward to left or right).

Results: A significant improvement of memory function occurred in these subjects after treatment. Before treatment, patients exhibited significant overactive in dorsolateral prefrontal cortex (dlpFC, Brodmann 46) as compared with that of normal on high load working memory (remember 5 digitals) condition. After treatment, activation in dlpFC area in patients was reduced significantly and the activated pattern on post-treatment was similar with that of normal. The activation changing in dlpFC just only showed on high load condition. There was no any significant changing in any other brain area neither on high nor low load condition.

Conclusion: Cognitive remediation therapy may normalize working memory related brain's activity on patients with schizophrenia.

THE DEVELOPMENT OF SYMPTOM ATTRIBUTION QUESTIONNAIRE FOR SCHIZOPHRENIA

INSTITUTIONS
1. Beijing Anding Hospital, Department of Psychiatry, Beijing 100088, China

AUTHORS
1. Zhanjiang Li, Dr., MD,PhD
2. Na Wang, Dr.
3. Ziyang Xu
4. Qingyan Yang

Objective: To develop Symptom Attribution Questionnaire for Schizophrenia (SAQS) to evaluate characteristics of symptom attribution in schizophrenics.

Methods: Based on four dimensions of attributional styles: Internal-External, Unstable-Stable, Local-Global and Controllable- uncontrollable, the self-scaling questionnaire in 5-point Likert scaling was made up according to diagnostic criteria (DSM-IV) of schizophrenia. The 9 items and 4 dimensions made up the first draft of SAQS in 5-point Likert scaling was made up according to diagnostic criteria (DSM-IV) of schizophrenia. The 9 items and 4 dimensions made up the first draft of SAQS including 36 items. 180 patients were measured formally by the draft, and developed the formal SAQS referring to the results of exploratory factor analysis. 60 patients and 32 normal control completed SAQS, and 18 patients among them were retested after one to two weeks.

Results: Exploratory factor analysis results showed that there was more reasonable to reserve 36 items and draw-off four factors which could explain 57.4% of total variation. The differences between patients and normal controls were significant at dimensions of Internal-External, Local-Global and Controllable-Uncontrollable (P<0.05). Cronbach’s α coefficients of each dimension were 0.86–0.92 and Spearman-Brown split-half coefficients were 0.80 – 0.89; the test-retest correlation coefficients were 0.73–0.83.

Conclusion: SAQS had good reliability and construct validity which reached the request of psychometrics, and could be used to evaluate symptom attribution of schizophrenia patients primarily.

THE ROLE OF ARTS, COMICS, MOVIES AND THEATRE IN THE GENDERED IMAGERY OF THE IMMUNE SYSTEM

INSTITUTIONS
1. Vienna Medical University, Center of Public Health, Institute of Medical Psychology, Vienna, Austria

AUTHORS
1. Klaus Spiess¹, Dr., MD, klaus.spiess@meduniwien.ac.at

Anthropomorphism in the imagery of immune cells is widely used in science, but also by patients and promotes creative solutions as well as flaws. This symposium focuses on gender related flaws in the imagery of immune cells and on the question, in which way artistic strategies can promote a suitable imagery to enhance the understanding of the immune system.
**HOW FEMALES IN A 70S’ SCIENCE FICTION MOVIE DIVE INTO IMMUNE ‘BODYSCAPES’ MAPPED BY MALES**

**INSTITUTIONS**
1. Vienna Medical University, Center of Public Health, Institute of Medical Psychology, Vienna, Austria

**AUTHORS**
1. Klaus Spiess¹, Dr., MD, klaus.spiess@meduniwien.ac.at

Feminism has criticised the arrival of analogies of (cold) war in immunology of the post WW II era. The arrival was typically mirrored by Richard Fleischer’s movie ‘Fantastic Voyage’ (USA, 1967), which used the visual equipment of Fleischer's earlier films about the deep sea and the universe and won the Oscar for best visual effects. A medical team and a submarine are miniaturized so they can go into the bloodstream of a spy to destroy a blood clot in his brain; the team has only sixty minutes for journey, operation, and getting out, otherwise will be attacked by the immune system. Throughout the film the relationship between the inside space of the body and the outside space of the military control room, which is connected to the security of the nation, is maintained through the use of maps and charts depicting different parts of the spy's body. The male scientists find little argument about whether to take the heroine, Raquel Welch, along (“a woman has no place on a mission like this”, Original Soundtrack). She wears a shapely diving suit to venture outside the submarine - only to return covered with antibodies that have to be removed from her breasts by the male scientists. "The de-antibodied Raquel Welch looked like a Las Vegas showgirl’s rhinestone-bedecked brassiere.” [...] (Interview Richard Fleischer). The movie transports the cliché that the unknown of the inner body, represented by deep sea and universe images and attacking females is safely mapped by males.

**DESIGNING SEXUAL CHARACTERISTICS OF IMMUNE CELLS IN A CHILDREN COMIC MOVIE**

**INSTITUTIONS**
1. Vienna Medical University, Center of Public Health, Institute of Medical Psychology, Vienna, Austria

**AUTHORS**
1. Guerkan Erman¹, guerkan.erlman@meduniwien.ac.at
2. Barbara Ilievski¹, Dr., MD, barbara.ilievski@meduniwien.ac.at
3. Klaus Spiess¹, Dr., MD, klaus.spiess@meduniwien.ac.at

**Background:** To give children a better understanding, directors of immunology comic movies use anthropomorphization of immune cells as technique. We analysed the animated cartoon ‘Once upon a time … Ilíc’, chapter immune system (Albert Barillé, 1986) in search of gender prejudices arising from this technique.

**Methods:** Investigated were the characters (n=135), who represent components of the immune system and invaders. Details of characters assessed: Sexual characteristics (primary, secondary, tertiary), dependency of the immune component on the sexual characteristics, dependency of time by playing and talking on the sexual characteristics and on the type of cell, duration of the appearances, time by talking, relational spacing, reduced spacing (time of local, slow movement, walking on the ground and slow driving), expanded spacing (time of fast agility and flying) and weapons used were all calculated. Calculations with One-way ANOVA.

**Results:** Primary sexual characteristics are not found, but 60 of the 135 actors have secondary sexual characteristics. The total acting time in the movie is dominated by male T cells which show expanded spacing, whereas female actors perform helper cells and basophiles which show reduced spacing. Male actors use more weapons and talk less than the female actors. Intruders appear as zoomorphic entities with tertiary sexual characteristics.

**Conclusion:** Barillé's animated cartoon about the immune system is dominated by anthropomorphic T cells, which show male secondary sexual characteristics and male spacing. Invaders also have male characteristics. Both are surrounded by either more slow moving or more talking female co-actors. We therefore recommend a gender-update of immune comics.
HOW A PSYCHODYNAMIC MIRROR MODEL WAS USED IN THE IMMUNOLOGY OF THE ‘80S

INSTITUTIONS
1. Vienna Medical University, Center of Public Health, Institute of Medical Psychology, Vienna, Austria
2. Vienna Medical University, Department of General Psychiatry, Vienna, Austria
3. University of Art, Media theory and Interface Cultures, Linz, Austria

AUTHORS

2. Susanne M. Bauer², Dr., MD, susanne.m.bauer@meduniwien.ac.at
3. Ramon Reichert³, Dr., PhD, klaus.spiess@meduniwien.ac.at
4. Bernard Bernatzik¹, Dr., PhD, klaus.spiess@meduniwien.ac.at

Objectives: To shift the recognition apparatus into the foreground was a radical departure from conventional art, psychoanalysis and biology practice between the 70s and 90s. The objective was to investigate the effects of the usage of metaphors of optical models by psychoanalysis and the arts on immunology.

Methods: Review of the literature and arts.

Results: Mirror models were used by MC escher, Cocteau, schoffer, Godard, Birnbaum and others, who explored the relation of the body self to the ‘visual’, ‘public’, ‘represented’, ‘alienated’ body. Lacan emphasized the development of the self by the (emotional) visual integration of the reflected ‘(m)other’ as an I. In his Nobel lecture, Jerne (1984), who often cited mirror works of the artists, regarded the inside mirror image of the outside alien as an I (the antibody) and simultaneously as the other (the antigen). What happens to the mirrored antigen, happens to oneself and both cannot go separate ways. Recognition happens within an endless ongoing process, a ‘hall of mirrors’ of antibodies. This mirror model also was used to distinguish between antibodies, which are ‘recognizing’ and ‘being recognized’.

Conclusion: Stimulated by the arts - psychodynamic optical models were metaphorically transferred to immunological theory to structurally change the level of representation within immunological theory.

GENDER RELATED IMAGERIES OF THE IMMUNE SYSTEM IN MEDICAL STUDENTS’ LAY ‘IMMUNE THEATRES’

INSTITUTIONS
1. Vienna Medical University, Center of Public Health, Institute of Medical Psychology, Vienna, Austria

AUTHORS
1. Barbara Ilievski¹, Dr., MD, barbara.ilievski@meduniwien.ac.at
2. Klaus Spiess¹, Dr., MD, klaus.spiess@meduniwien.ac.at

Background: The hidden survival of gender clichés in the metaphors of immunology has been criticized. We investigated imageries that medical students use when they think about immune interactions.

Methods: We analysed 22 groups of medical students (n=130, 57 male, 73 female). Students transferred textbooks dealing with the relation of the immune system to invaders into videotaped choreographies. The dependency of the immune components performed on the student actors’ sex, the style and temporal course of interaction, reduced spacing (time students are in a crouching or touching position), expanded spacing (time of moving around or physical distant), time until elimination of an antigen, requisites used, dominating actors (social group hierarchies), signals received or sent, individual choreographies (birth giving, garbage collecting, etc.) were analysed. Calculations with One-way ANOVA.

Results: Male students performed T cells more often, which directed the B cells performed by females. Antibodies were all performed by females, after a ‘birth giving’ act. Males performed less often macrophages (choreographed as rubbish collecting acts by females), and less innate immunity, but performed tumour cells more frequently, placing themselves in a central position. Males used an expanded space linked to T-cell acting, while females used a reduced space linked to macrophage acting. Males acted more straightforwardly to eliminate the antigen, whereas females waited longer using more requisites to collect further signals for the meaning making of another person as an antigen.

Conclusion: Transference of textbooks into a choreography helps to discover gender clichés and gender hierarchies in medical students’ imageries about immunological interactions.
HUMOROUS ANTHROPOMORPHISATION IN AN EDUCATIONAL VIDEO FOR PATIENTS WITH AUTOIMMUNE DISEASES

INSTITUTIONS
1. Istanbul University, Department of Radio Television Cinema, Faculty of Communication, Istanbul, Turkey
2. Vienna Medical University, Center of Public Health, Institute of Medical Psychology, Vienna, Austria
3. Istanbul University, Department of Rheumatology, Cerrahpaşa Medical School, Istanbul, Turkey

AUTHORS
1. Sermin Ildirar1, klaus.spiess@meduniwien.ac.at
2. Barbara Ilievski2, Dr., MD, barbara.ilievski@meduniwien.ac.at
3. Guerkan Erman2, Guerkan.erman@meduniwien.ac.at
4. Koray Tascilar3, Dr., MD, klaus.spiess@meduniwien.ac.at
5. Klaus Spiess2, Dr., MD, klaus.spiess@meduniwien.ac.at

Objectives: To understand their auto-immune disease, rheumatoid arthritis patients use daily-life analogies as broken machines, pathetic war allegories and moralization of good and the bad cells. Science films use analogies of the public (signaling, traffic, etc) to explain auto-immunity, setting the analogy far from being embodied by patients.

Purpose: Development of a video which better embodies a scientific model of auto-immunity for rheumatoid arthritis patients.

Method: The biology of auto-immunity (immune cells enter forbidden areas, they don't get apoptotic signals, they confuse former bacterial infection with own tissues, cortison makes lymphocytes slippery) by its narrative style has some analogies to a comedy (masking, surprise, intellectuality) and by the cells movement analogies to slapstick (physical misfortune and pitfalls, abuse, self-injury, absurdity) both which are deeply rooted in cinema since Chaplins' 'Modern Times'. The "slippery, volatile, ambivalent nature of subject-object relations in mimetic performance", which diverts objects from "familiar, ritualised, strategic functions" has been emphasized as 'mimetic playfulness' by Benjamin, 1986. Today, humour is also well used in psychotherapy. To give patients a better basis for identification we playfully mimicked some theories of auto-immunity within the privacy of a flat and developed an animated 'talking lymphocyte'.

Results: As documented by the video after having been confronted by its contents, we found the eight rheumatoid arthritis patients only partly remembered the cognitive contents, but in all strained moods and body gestures changed positively. We conclude that playfully mimicking biological information can help rheumatoid arthritis patients to better develop personal analogies about their disease.

Section symposium of Psychoneuroendocrinology, WPA

Background and Introduction: Psychoneuroendocrine field has been pivotal in delineating existing link between human beings and their environments including social and psychological spheres. The field of stress has been a challenging one to understand how exactly it affects brain mechanisms, physiology and metabolism in human body. There is considerable evidence that living in present time requires coping up with both acute and chronic stress. Since a long time HPA axis has been central to the research in understanding how stressful life events and cumulative stress has been affecting our body system. There have been limitations in translating conclusions of experimental modes to clinical situations. There has also been limitation of developing targeted therapeutics to deal with stress-induced disorders. Considerable advances in neuroscience, behavioral medicine, neuroimaging and genetics is likely to offer some answers to the complex question of how does stress factors operate and what exactly needs to be done to cope. The present symposia will touch upon advances in link between stress endocrine aspects of mental health. The presenters will be highlighting some of the ongoing work in this field and discuss the enthusiasm and reality of the advancements.

Learning objectives: at the end of the symposia the delegates are expected to
1. Understand complexity of stress-endocrine research
2. Learn the process and advancements
3. Recognize the potential advantage and limitation of stress-endocrine research in mental health
Mental health research is very much in need for a simpler understanding of the way biological responses arise in face of psychological and social challenges. Though it appears very simple to state that mind and body are integrated, on continuum and even dimensional, however the fact is that very little is known for this complex relationship. The limitations have been primarily in field of experimental models of stress, which have not been very successful. The area of co morbid illness with physical illness or psychosomatic or physical consequences of psychological illness, all these have been characteristic with the ‘missing-link’.

There is now considerable advancement, particularly from the field of PTSD to understand the interplay of neuro-endocrine-neurotransmitter-neuromodulators along with genetic expression and cell biology. It is more clearly understood now the genetic mechanism play important role in providing the fertile or infertile background for behavioral characteristics which causes and modulates individual ‘vulnerarism’ Long before it way s observed that social changes can induce brain volume changes. There is some more light from current research in the field of imaging. However will the stress-endocrine response be able to reach a point of providing specific therapeutic probes remains only a matter of speculations, so far. We hope that the complexity and limitations will be minimized in future.

Several studies have documented long-term neurobiological consequences of early adverse events in laboratory animals and man including HPA axis hyperactivity in response to stress, and reductions in hippocampal volume. This presentation will summarize new findings that confirm and extend these previous observations. When compared to women without adverse childhood experiences, cerebrospinal fluid (CSF) concentrations of oxytocin (OT), a neuropeptide known to play a role in affiliative behavior, were markedly decreased in women who experienced abuse and neglect, as well as other forms of maltreatment. Moreover, CSF concentrations of corticotropin-releasing factor (CRF) were elevated in women exposed to abuse during childhood, and was correlated with abuse severity and duration. Dex-CRF testing, a sensitive measure of HPA axis activity, revealed marked ACTH and cortisol hypersecretion in men with a history of childhood abuse, and the magnitude of the response was also correlated with abuse severity. The latter study also revealed hypersecretion of inflammatory cytokines associated with depression and child abuse. Genetic polymorphisms of the CRF receptor have now been identified that markedly affect the vulnerability to depression in patients with early life trauma. Finally, functional brain imaging studies revealed region-specific alterations in depressed women with early life trauma in response to specific provocative stimuli. These findings support the hypothesis that adverse early life events produce persistent CNS alterations that contribute to vulnerability to depression, and moreover, that this concatenation of findings supports a pathophysiologically distinct endophenotype (early life trauma) of major depression.

PSYCHONEUROENDOCRINOLOGICAL LINKS BETWEEN CHRONIC STRESS AND DEPRESSION: FOCUS ON THE INTERACTIONS BETWEEN THE HPA AXIS AND THE 5HT SYSTEM

INSTITUTIONS
1. Maimonides University, Psychiatry and Neurosciences, Buenos Aires, Argentina

AUTHORS
1. Gustavo E. Tafet, Dr., MD, PhD, psychiatry@maimonides.edu
2. Jaime Smolovich, Dr., MD

The link between chronic stress and the origin and development of depression has been demonstrated, where alterations of the limbic-hypothalamic-pituitary-adrenal (HPA) system, with the consequent increase in cortisol levels, represents one of the most consistent and best studied condition in both syndromes. In this regard, it has been proposed that increased levels of cortisol could be directly involved in the typical mood changes observed in depression, and several lines of evidence converge to support the notion of a direct connection between increased levels of cortisol and alterations of the serotonergic neurotransmission in major depression. In a recent study we demonstrated that cortisol may induce an increase in serotonin uptake, and this may be due to an increased expression of the gene coding for the serotonin transporter. Therefore, a novel hypothesis proposed by our group is intended to link a potential alteration of the HPA system with the serotonergic hypothesis of depression. The aim of this study is to develop a psychoneuroendocrinological model, which integrates psychosocial and neurobiological aspects, allowing understanding the link between chronic stress and mood disorders, both at the clinical and the molecular levels. This may lead to develop new strategies for the early treatment of chronic stress disorders as well as to prevent the development of depression.

GENETICS AND STRESS-ENDOCRINE RESPONSE RESEARCH

INSTITUTIONS
1. C.S.M. Medical University (Earlier King George’s Medical University), Department of Psychiatry, Lucknow, India

AUTHORS
1. Jitendra Kumar Trivedi
2. Adarsh Tripathi

Stress is the disruption of homeostasis through physical or psychological stimuli. It has been invoked as a cause of major psychopathology, a precipitator or trigger of psychiatric illness, and a contributor to a considerable mental anguish (Dimsdale, 2005). Stressful stimuli can be mental, physiological, anatomical or physical reactions (Lazarus, 1993).

The body reacts to stress first by releasing the catecholamine hormones, epinephrine and norepinephrine, and the glucocorticoid hormones, cortisol and cortisone. The hypothalamic-pituitary-adrenal axis (HPA) is a major part of the neuroendocrine system, involving the interactions of the hypothalamus, the pituitary gland, and the adrenal glands.

The advances of genetic issues in relation to stress are still in the preliminary stage and various aspects have been researched so far. However, most of the research information available is through the indirect sources like PTSD and other anxiety disorders. Neurochemistry and genetics of the stress is being understood although much remains to be discovered about how this system interacts with others in the brain and elsewhere in the body. Genetic factors are believed to underlie individual differences in the degree of stress resilience and thereby contribute in determining susceptibility to stress-related pathologies like major depressive disorder (MDD) (Mbemba et al 2007). Little, however, is known about the genetic influence on the endocrine and behavioural stress response in relation to MDD. Physiological responses of acute stress are well known, but considerably less is known about the responses of the chronic stress.

THE PRACTICE AND ETHICS OF ELECTROCONVULSIVE THERAPY

INSTITUTIONS
1. St George’s, University of London, Division of Mental Health, London, United Kingdom

AUTHORS
1. Mohammed T Abou-Saleh, mabousal@sgul.ac.uk

The objectives of this symposium are: to present the WPA position statement on the use and safety of electroconvulsive therapy (ECT) and the addendum to the WPA statement on the ethics of unmodified ECT inviting a debate on whether it is ever justified to administer it in exceptional circumstances. This will be followed by presentation on the efficacy of ECT in the maintenance treatment of depressive disorders and contributions on its ethics particularly the practice and ethics of unmodified ECT.

THE PRACTICE AND ETHICS OF ELECTROCONVULSIVE THERAPY

INSTITUTIONS
1. St. George’s, University of London, Division of Mental Health, London, United Kingdom

AUTHORS
1. Mohammed T Abou Saleh, Professor, mabousal@sgul.ac.uk

M. T. Abou-Saleh & George Christodoulou The workshop on practice and ethics of Electroconvulsive Therapy will be introduced by a presentation of the Position Statement on the use and safety of electroconvulsive therapy (ECT) which has been prepared on behalf of the WPA Section on Biological Psychiatry at the request of the Executive Committee of the WPA. The statement has been informed by available evidence and reference will be made to guidelines produced by a number of authoritative bodies, including the American Psychiatric Association, the Royal College of Psychiatrists, the UK National Institute of Clinical Excellence (NICE) and the World Federation of Societies of Biological Psychiatry. Moreover, for depressive disorders particular reference will be made to the recently published systematic review and meta-analysis by the UK ECT Review Group (2003). The scope of this statement is to consider the evidence for the efficacy of ECT in the treatment of depressive and other psychiatric disorders and its safety and determine its optimum use with continuation pharmacotherapy and provide recommendations for practice. Moreover reference will be made to the draft addendum to the WPA Statement on the ethics of unmodified ECT inviting a debate on whether it is ever justified to administer it in exceptional circumstances.

THE USE OF ECT FOR THE TREATMENT OF ACUTE MAJOR DEPRESSION AND FOR RELAPSE PREVENTION: RESULTS FROM A MULTICENTER TRIAL BY THE CORE GROUP

INSTITUTIONS
1. University of Medicine and Dentistry of New Jersey, United States

AUTHORS
1. George Petrides, petridge@umdnj.edu

Background: ECT has never been systematically assessed as a strategy for relapse prevention. In this symposium we will discuss the results of a multi-site, NIMH-funded study designed to evaluate the comparative efficacy of continuation ECT (C-ECT) and the combination of lithium plus nortriptyline (C-Pharm) in the prevention of depressive relapse. We will present data from both the acute phase treatment as well as the 6 month continuation period.

Methods: A total of 531 subjects with SCID-diagnosed unipolar depression were entered into the acute phase. 341 (64.2%) remitted, 53 (10%) did not remit and 137 (25.8%) dropped out. Two hundred and one patients who had remitted were randomized to receive either C-ECT or C-Pharm for six months.

Results: In the C-ECT group 46.1% remained remitted at study end, 37.1% relapsed and 16.8% dropped out. In the C-Pharm group 46.3% remained remitted, 31.6% relapsed, and 22.1% dropped out. Both groups had relapse proportions significantly lower than an historical placebo control from a similarly designed study.

Conclusions: Although C-ECT and the C-Pharm combination of nortriptyline and lithium were shown to be superior to an historical placebo control, both had relatively limited efficacy, with over half of patients either relapsing or dropping out. Even more effective strategies for relapse prevention in mood disorders are urgently needed.

THE CLINICAL AND ETHICAL BASIS OF MAINTENANCE ECT FOR THE PREVENTION OF RECURRENT DEPRESSIVE EPISODES

INSTITUTIONS
1. Barnet, Enfield and Haringey Mental Health NHS Trust, United Kingdom

AUTHORS
1. Nikos Christodoulou, nikoschristodoulou@gmail.com

Electroconvulsive Therapy is an established therapeutic option for severe depression. There is good evidence for its use in rapid symptomatic alleviation and in relapse prevention. In this presentation the controversial role of maintenance ECT in the prevention of recurrent episodes of major depression is discussed. The latest evidence base is reviewed and important clinical issues are discussed, with emphasis on ethical considerations.

UNMODIFIED ECT: ETHICAL ISSUES IN INDIA

INSTITUTIONS
1. C. S. M. Medical University, Psychiatry, India

AUTHORS
1. Mohan Dhyan\textsuperscript{1}
2. T Sivakumar\textsuperscript{1}
3. Jitendra Trivedi\textsuperscript{1, jktrivedi@hotmail.com}

International consensus guidelines on ECT recommend modified ECT and do not consider the unmodified ECT as an option under any circumstance. India, while far better developed than most countries in the continents of Asia and Africa, nevertheless has large economic and geographic subpopulations to which even the barest minimum standards of health care cannot be assured. Modified ECT reduces musculoskeletal risks, pre ECT anxiety, and the other uncommon adverse effects of unmodified ECT but modified ECT is beyond the means and reach of a large segment of Indian society besides the risks associated with anesthesia. Civil rights activists have filed writ petitions seeking a blanket ban on unmodified ECT but the date of final judgement of Supreme Court remains distant and uncertain due to the overburdened legal system. Modified ECT is ideal. But in situations where expected gains with ECT outweigh the risks with unmodified ECT, unmodified ECT is preferable to no ECT especially when recent data suggests that unmodified ECT is less suboptimal than earlier believed. Regrettably, the Indian Psychiatric Society does not have an official position on unmodified ECT, nor has it issued treatment guidelines in this regard.

TRANSITION PROCESS TO MODIFIED ECT IN TURKEY

INSTITUTIONS
1. Bakirkoy State Teaching Hospital for Psychiatry and Neurology, Istanbul, Psychiatry, Turkey

AUTHORS
1. Dogan YESILBURSA\textsuperscript{1, dyesilbursa@hotmail.com}
2. Tarik KUTLAR\textsuperscript{2}
3. Nesrin TOMRUK\textsuperscript{1}
4. Timucin ORAL\textsuperscript{1}

The use of ECT varies widely among different countries. One of the main reasons for this variability is the ambivalence among psychiatrists toward ECT and a bad reputation that the procedure gained in public. Other reasons of avoidance may lie in its history of unmodified administration and the side effects observed, wrong indications it was used for and public prejudices against it. The clinical conditions in which patients are treated due to many factors such as social, political and economical procedures and availabilities that, unmodified ECT was the main method of administration in many developing and low income countries with poor service infrastructure and limited availability of anaesthetists and medication for the administration of modified ECT.

Unmodified ECT was widely practiced in Turkey, until the end of 2005. Especially after the visit of CPT in December 2005, efforts towards the discontinuation of unmodified ECT use resulted in an ‘ECT Application Directive’, which was released by the Ministry of Health. This directive is in effect since 28.11.2006. In July 2007, “ECT Application Guidebook” was prepared by Bakirkoy State Teaching Hospital for Psychiatry and Neurology and distributed to all psychiatry clinics in Turkey. Currently, all ECT practice in all hospitals throughout Turkey are conducted in accordance with these directives, in addition to universal ethical codes and medical indications.

CORRELATES OF PSYCHIATRIC REHABILITATION IN DIFFERENT SETTINGS

INSTITUTIONS
1. New York University School of Medicine, Psychiatry, New York, United States

AUTHORS
1. Zebulon Taintor¹, Professor, MD, taintz01@med.nyu.edu

These presentations from the Section on Rehabilitation show the diversity of settings and measures in which psychiatric rehabilitation can be successful. Patients were old, prisoners, or addicted. Correlates were neurophysiological, behavioral, or measurement scales.

BRAIN IMAGING DURING REHABILITATION OF SUBSTANCE ADDICTS IN RESIDENTIAL TREATMENT

INSTITUTIONS
1. New York University School of Medicine, Psychiatry, New York, United States

AUTHORS
1. Gregory Bunt¹, Dr., MD, GBunt@daytop.org

Objectives: Define neurophysiological correlates of residential program rehabilitation for drug addiction. Methods: Daytop Village an NGO based on the Therapeutic Community rehabilitation model was founded in 1963 in the United States has many residential and outpatient treatment facilities. In 2003, the Nathan Kline Institute (a New York State - NYU Medical School center for psychiatric research) and Daytop Village collaborated in a NIDA funded pilot clinical study to look at white matter abnormalities in cocaine dependent clients by using MRI scans. Evidence suggested that cocaine dependence is associated with white matter deficits that may underlie changes in mood, cognition and behavior. Subjects (N=46) were sub-grouped by duration of abstinence from cocaine and then matched with non-using controls.

Results: The pilot study showed reversible as well as persistent increases in frontal white matter fractional anisotropy, a measure of deficits and impaired functional status of the subjects tested.

Conclusion: These results have prompted Nathan Kline - NYU to proceed with a larger NIDA funded longitudinal clinical protocol in collaboration with Daytop Village scheduled to commence 2008. Future studies may involve tracking responses to addiction stimuli, such as pictures of drug paraphernalia.
COMMUNITY-ORIENTED RE-ENTRY FROM PRISON

INSTITUTIONS
1. New York University School of Medicine, Psychiatry, New York, United States

AUTHORS
1. Zebulon Taintor¹, Professor, MD, taintz01@med.nyu.edu

Objectives: to reduce recidivism and promote community adjustment of mentally ill offenders being released from maximum security prisons in New York State

Methods: Prisoners suffering from severe and persistent mental illness who were expecting to be released within the following nine to 12 months were referred from prisons all over New York State. A screening committee selected candidates based on need and likelihood to benefit from the 90 day program. They were transferred to Sing Sing and housed together in a block of cells, coming each day to a floor of classrooms and conference rooms for group and didactic work. They were assessed for skills in handling the challenges they would face on release: food, clothing, shelter, money, family, friends, community, strangers, temptations and stimuli of all sorts. Mental illness as a special challenge occupied a third of the curriculum: diagnosis, medication, psychotherapy (individual and group) and community services.

Results: The one year reincarceration rate for prisoners discharged from Sing Sing is 65%. Despite the comorbidity of severe and persistent mental illness(es) only 13% of program completers were reincarcerated in a year, the others staying in their communities. Much of this good result can be attributed to continuity of care. The prison superintendent was appointed Corrections Commissioner to extend this and similar programs throughout New York State.

Conclusion: Recidivism and community adjustment are practical measures of rehabilitation. Measures to assess program staff involvement will be important as the program becomes widespread from its initial base of committed enthusiasts.

THE VALIDITY OF THE „CARERS’ NEEDS ASSESSMENT FOR DEMENTIA” (CNA-D)

INSTITUTIONS
1. Medical University of Vienna, Psychiatry, Vienna, Austria

AUTHORS
1. Johannes Wancata¹, Professor, MD, johannes.wancata@meduniwien.ac.at

Objectives: How often which interventions are needed by the caregivers of dementia patients is essential for planning services. For this purpose, „Carers’ Needs Assessment for Dementia” (CNA-D) has been developed. The aim of the present study was to examine the concurrent validity of the CNA-D.

Methods: Forty five relatives of dementia patients were enrolled for this study. To evaluate if plausible associations (i.e. indicators for concurrent validity) exist, two summary scores of the CNA-D were used: the number of moderate or serious problems among the carers and the number of interventions needed. Further, the patients’ living situation (private household vs. nursing home), the amount of time spent with the patient, and indicators for depression or anxiety among the caregivers („General Health Questionnaire”, GHQ-12) were assessed. The „Camberwell Assessment of Needs for the Elderly” (CANE) was used for investigating the needs of the patients.

Results: The numbers of carers’ problems (CNA-D) were positively associated with the number of symptoms indicating anxiety disorders or depression (GHQ 12), the living situation of the patient (private household vs. nursing home) and the amount of time spent with the patient. Negative correlations were found with the extent of support the patient received from the private social network or from professional services (CANE). Similar results were yielded for the number of interventions needed (CNA-D).

Conclusion: Overall, these associations seem to be plausible. Thus, our results indicate that the concurrent validity of the CNA-D is satisfactory.
CORRELATES OF AGRITHERAPY IN PAKISTAN

INSTITUTIONS
1. Fatima Jinnah Medical College, Psychiatry, Lahore, Pakistan

AUTHORS
1. Haroon R Chaudhry, Professor, MD, pprc@wol.net.pk

Objectives: Define agritherapy rehabilitation process and outcome correlates in a low technology setting (rural Pakistan).

Methods: Fountain House Lahore, while affiliated with Fountain House in New York City, grew from its own cultural roots. Early in the service of people with chronic mental illness it became clear that many of our members had little experience or skills outside of a crowded urban setting in which they often were victimized. The Fountain House farm was developed as much to provide the rural experience as to develop agricultural skills. It is set up to be the opposite of the urban environment: uncrowded, quiet, yet with abundant nonthreatening stimuli. The soil is rich and well irrigated. Several fields are used for crops. Animal husbandry includes chickens, goats, sheep and cattle. The farm works well with several dozen resident members and a few staff. There have always been more requests for member placements on the farm than can be accommodated, despite expanding over the years.

Results: Few members have not succeeded in achieving their goals. Almost all benefit enough from their stay of a few weeks or months to either return to the Lahore facility at a higher level of functioning or are discharged to continue rural life, often in villages from which they or their forbears came. Some good results could not have been achieved without the farm experience. Observations and measures will be detailed in the presentation.

Conclusion: Agritherapy is a valuable adjunct to an urban clubhouse program.

REHABILITATION PROGRAM FOR ELDERLY PEOPLE

INSTITUTIONS
1. Pomaz Psychiatric Hospital, Research, Pomaz, Hungary

AUTHORS
1. Ida Kosza, Dr., MD, PhD, kosza@mail.datanet.hu

The societies are getting to have more and more elderly people, and not only in Europe. Therefore it is an urgent need to outline a program for that part of the society. The first step is to draw up the definition of rehabilitation in this case.

The rehabilitation of the elderly people - but all types of psychiatric illnesses - is possible just on the level, what the patient by the help of a strong and proper program is able to realize. We cannot demand more, what the patient is able to realize, but we must demand the highest levels of their abilities.

In the case of different level of dementia the first step is the therapy with medicine. The most important thing to keep the dignity for the demented persons in any level of dementia.

In hospitals or in other type of institutions must have well organized program with different types of sociotherapeutic methods taking into consideration their somatic diseases.

The main goal is to suggest the people to live in the community, when the needed circumstances are existing for them.

This is a joint symposium of the WPA Sections on Public Policy and Psychiatry and on Preventive Psychiatry. International experts will present and discuss about recovery concepts and alternatives in different practice areas.

RECOVERY AND CLINICAL CARE

INSTITUTIONS
1. University of Colorado, Colorado Recovery, Colorado, United States

AUTHORS
1. Richard Warner¹, Prof. Dr., MD, drdickwarner@aol.com

The recovery model refers both to the subjective experiences of hope, empowerment and interpersonal support experienced by people with mental illness, their carers and service providers, and to the creation of recovery-oriented services that engender a culture of healing and support for human rights. Flowing from this model is a renewed interest in fighting stigma and providing access to service-user education and peer support. The model calls for treatment decisions to be taken collaboratively with users, the creation of user-run services such as “warm-lines” and drop-in centers, and collaborative models, such as the psychosocial clubhouse and educational programs taught by professionals and service-users.

The roots of the recovery model lie in both the user/survivor movement and professional rehabilitation initiatives. Service-users have reinforced the drive towards empowerment, collaboration and human rights. Rehabilitation professionals have emphasized the need for the value of work, a sense of community among people with mental illness and the importance of environmental factors. A marriage between these two areas can be strengthened if consumers are involved in conducting research and in planning and implementing services. Professional schools should recruit service-users as students, and professionals who have experienced mental illness should feel free to speak out about their experience.

**SECTION SYMPOSIA**

**RECOVERY AND MENTAL HEALTH NURSING: A PERFECT FIT?**

**INSTITUTIONS**
1. Hochschule für Angewandte Wissenschaften, Institut für Angewandte Pflegewissenschaft, St. Gallen, Switzerland

**AUTHORS**
1. Ian Needham¹, Prof. Dr., needham@bluewin.ch

**Context:** The recovery model is gradually gaining momentum in the German speaking region thanks to the endeavours of user groups and professionals alike. However, to date little is known on the actual implementation of the recovery approach in mental health nursing in the German speaking area. In Scotland and the Republic of Ireland specific approaches to integrate the concept of recovery in mental health nursing have evolved (Buchanan-Barker & Barker 2006; Shanley Jubb-Shanley 2007). The Tidal model proposed by Barker-Barker emphasises ten commitments central to the recovery model and the Irish group has developed the recovery alliance theory (RAI) employing six constructs and the three concepts of coping, self-responsibility/control and working alliance.

**Objectives:** By examining the interface between the foundations of recovery and those of modern mental health nursing this paper argues that mental health nurses can and should integrate the recovery approach into their reference framework.

**Key messages:** Due to mental health nurses’ extensive contacts with users in inpatient and extra-mural settings, they may become an important fulcrum to aid the advancement of recovery.

**Conclusions:** Mental health nurses - in collaboration with other professionals - are predestined to play an important role in promoting hope, healing, empowerment and interpersonal support in order to enhance users’ functioning and quality of life.

**ALTERNATIVES AND RECOVERY BEYOND PSYCHIATRY**

**INSTITUTIONS**
1. European Network of Users-Exusers and Survivors of Psychiatry (ENUSP), Berlin, Germany

**AUTHORS**
1. Peter Lehmann¹, Mr., mail@peter-lehmann.de

**Context:** A positive connotation of hope is common to all users of the term “recovery”, by those critical of psychiatry and by psychiatrists. But the term has different implications. For some, recovery means recovering from mental illness, reduction of symptoms or cure. Others use it to signify an abatement of unwanted effects of psychiatric drugs after their discontinuation, the regaining of freedom after leaving the mental health system, or “being rescued from the swamp of psychiatry.” Psychiatrists like to keep their eyes locked up about this last unpleasant fact.

**Objectives:** This lecture will raise awareness about the problem, that disability can be produced by psychiatric treatment, for example by neuroleptics in form of tardive dyskinesia or tardive psychoses. But world-wide there are proven drug-free support systems and approaches which enhance self-help abilities and provide support to enable people to care for themselves.

**Key Message:** There are people with emotional distress with positive experiences who recover in alternatives beyond psychiatry, by coming off psychiatric drugs and leaving the psychiatric field. Fading out these experiences, by ideological reasons or omission of continuing training, is a medical malpractice.

**Conclusion:** For further training, psychosocial professionals should engage users and survivors of psychiatry who recovered from their emotional problems and from psychiatric treatment. And – fitting to a society with claims to be democratic - freedom of choice and alternatives beyond psychiatry should be available.

Diagnostic assessment in psychiatry is located between two poles: at one pole we find the medical philosophy of DSM-IV or ICD-10 with its usefulness for standardized assessment, epidemiologic research and communication, at the other pole we find the clinical necessity to consider the uniqueness and individuality of a person who presents for care for mental health problems. The philosophy of recovery includes hope, support, integration into the community, and individual ways towards positive health and healing. Such a philosophy induces a perspective on a person’s resources and resilience, subjectivity, life-historical development and personal meaning of the illness, as well as a genuine interest of the diagnostician towards the person as a whole who presents for care. In her paper, the author will describe some diagnostic approaches which could be useful for a recovery-oriented care system, such as the Person-centered Integrative Diagnostic Model (PID), the Need-adapted Approach from Scandinavia, or diagnostic assessments of a person’s resources and positive health.

FACTS AND VALUES IN CLINICAL JUDGEMENT

INSTITUTIONS
1. University of Central Lancashire, Preston, United Kingdom

AUTHORS
1. Tim Thornton1, Professor, tthornton1@uclan.ac.uk

Arguments for the presence of values in psychiatric diagnosis often turn on a distinction in the 'logic' of evaluative and plainly descriptive terms which preclude the reduction of values to facts. In this presentation, I reassess this distinction and the implications for clinical judgement that follow from it.

VALUES-BASED PSYCHIATRY: NATIONAL INITIATIVES AND INTERNATIONAL PROSPECTS FOR A NEW ‘PSYCHIATRY OF THE PERSON’

INSTITUTIONS
1. University of Warwick, Coventry, United Kingdom
2. University of Central Lancashire, Preston, United Kingdom

AUTHORS
1. K.W.M. Fulford1,2, Professor, pwwf@norcam.demon.co.uk

The 1990s, widely celebrated as the ‘decade of the brain’, also turned out to be the ‘decade of the mind’. Alongside dramatic developments in the neurosciences, there was an unprecedented growth in interdisciplinary work between philosophy and psychiatry. This paper will outline these developments, focusing particularly on the impact of the new philosophy of psychiatry on service development, policy training and neuroscience research in what has become known as ‘values-based practice’. The paper will give examples of some of the ways in which values-based practice, working alongside evidence-based practice, is being used to support clinical decision-making in context, such as in cultural psychiatry, where complex and diverse values are in play. The paper will conclude by setting current developments in their historical context and indicating the likely future directions for developments in a psychiatry for the twenty first century that is both science-based and person-centred.
A PSYCHOLOGICAL FRAMEWORK FOR UNDERSTANDING END-OF-LIFE DECISIONS

INSTITUTIONS
1. Imperial College London, London, United Kingdom

AUTHORS
1. Tom Sensky, Professor, t.sensky@imperial.ac.uk

Even if a person appears to have the capacity to reach a decision that will result in ending his or her life, clinicians sometimes have great difficulty in accepting the person’s right to autonomy. Many clinicians are particularly concerned about missing subtle signs of depression or other factors in the person’s current presentation that might possibly bias decision-making. A key reason for this concern is that clinicians and others commonly find it very difficult to conceptualise why a person might make a ‘rational’ decision to wish to end his or her life. A basic conceptualisation will be proposed, based on Eric Cassell’s seminal definition of suffering as a threat to the Self. While some people, in some circumstances, are able to envisage ways of reducing threats to the Self, it is proposed that the decision to end life is more likely when the person can see no way to reduce his or her personal suffering. This conceptualisation is based on personal experience of assessing clinically a small number of cases. Further testing with other people wishing to end their lives will determine to what extent this conceptualisation is clinically helpful and generalisable.

VALUES IN THE ASSESSMENT OF DECISIONAL CAPACITY

INSTITUTIONS
1. University of Western Ontario, London, Ontario, Canada

AUTHORS
1. Louis C. Charland, Dr., Ph.D., charland@uwo.ca

Aim/Objectives: To examine the problem of how values figure in the assessment of decisional capacity.

Methods: (a) Review of the relevant literature; (b) Theoretical discussion and analysis of leading test and methods for the assessment of decisional capacity, especially the MacCAT-T.

Discussion: In a recent discussion exploring the merits of his MacCAT-T model for the assessment of decisional capacity, Paul S. Appelbaum acknowledges that differences over the criteria deemed necessary for capacity may lead to disagreements over the empirical validity of proposed models.1 I argue that there are good ethical and empirical reasons for believing that values must play a larger role in the assessment of decisional capacity and offer some tentative suggestions about how the MacCAT might be modified to accommodate such changes.2

Conclusion: Current models and criteria for assessing decisional capacity need to be revised in order to make more adequate provision for how values contribute to decisional capacity.

**Objectives**
Freudian and biological psychiatry to shed light on both proximal and ultimate causes of psychopathology, with implications ranging from molecular genomics to clinical psychotherapy.

**EVOLUTIONARY EPIDEMIOLOGY OF MANIA, DEPRESSION, AND PSYCHOSIS**

**INSTITUTIONS**
1. Creighton University, Psychiatry & Anthropology, Omaha, Nebraska, United States

**AUTHORS**
1. Daniel R. Wilson¹, Dr., MD, PhD, wilson@creighton.edu

**Background and Objective:** Until recently, psychiatry and related studies have remained unenlightened by the evolutionary perspective. Genetically informed neuroscience has more recently moved psychiatry toward Darwinian genomics.

**Methods:** Evolutionary genetics and psychiatric epidemiology are melded to assay possible past selective advantages of several major types of epigenetic psychopathology.

**Results:** Genomic rates of mania, depression, and psychosis surpass thresholds of prevalence to be readily explained by factors other than selective advantage in the environment of evolutionary adaptation.

**Conclusions:** Contrary to usual presumptions, evolutionary epidemiological analysis strongly suggests that some, even much, of major psychopathology is due to past evolutionary selective advantage.
EVOLUTIONARY EPIDEMIOLOGY OF SCHIZOPHRENIA AND REDUCED RISK OF SOMATIC ILLNESS

INSTITUTIONS
1. Creighton University, Psychiatry, Omaha, Nebraska, United States
2. University of Cagliari, Psychology, Cagliari, Italy

AUTHORS
1. Antonello Preti², Dr., MD, apreti@tin.it
2. Daniel Wilson¹, Dr., MD, PhD, wilson@creighton.edu

Background and Objectives: Natural selection should have eliminated any genetic tendency to suffer from schizophrenia, hampered by low fertility rates and an enhanced risk of premature death. Speculations hold that the same genes that confer some risk for schizophrenia could also protect the carriers from some somatic illness.

Methods: Literature investigating the reduced risk of somatic illness in schizophrenia was reviewed. Medline (1967-2005) was searched combining the MeSH term of schizophrenia with the MeSH terms of general physical disease categories to identify relevant studies.

Results: Persons with schizophrenia have reduced prevalence of cancer, type I diabetes mellitus, and rheumatoid arthritis (1). These somatic illnesses all are due to mechanisms of an inflammatory, immune and/or vascular basis involved in neurodevelopment. All reduce impact of obstetric complication on maturing brain. Fetal brain anoxia, such as from obstetric complications, leads to death or severe neuromental impairment.

Conclusion: A brain-protecting gene could mitigate impact of such obstetric complications, and schizophrenia would develop only in the presence of the protecting gene(s) (2). The same genes that protect the brain from damage after pre-/perinatal insults, favor development of schizophrenia at later ages also protect from the risk of type I diabetes mellitus, rheumatoid arthritis, and cancer.

TOTAL, COMPLETE, UNQUALIFIED SUBMISSION TO GOD RELIEVES DEPRESSION: A LESSON FROM THE BOOK OF JOB AND THE BHAGAVAD GITA

INSTITUTIONS
1. Creighton University, Psychiatry & Anthropology, Omaha, Nebraska, United States

AUTHORS
1. John S. Price¹, Dr., MD, johnscottprice@hotmail.com
2. Daniel R. Wilson¹, Dr., MD, PhD, wilson@creighton.edu

Background and Objectives: Churches all over the world offer relief from depression and anxiety, conditional on belief in and submission to God, and presumably they are at least partly successful. Submission plays little part in psychotherapy, acceptance being a more acceptable term, but perhaps there is something to learn from ancient scriptures.

Methods: Two ancient texts that depict heroes who incompletely submit to God are reviewed. One, Arjuna, a leader in the Bhagavad Gita, decided to not fight in defiance of his deity, Krishna. The other, Job of the Old Testament, complained bitterly that God treated him unfairly.

Results: Both heroes suffer affective disturbance: Arjuna is dejected, Job is depressed. After they interact with God, both then submitting totally, they experience relief of their affective disturbances.

Conclusions: These old texts illustrate and support the idea that depression may in part represent involuntary submission, with improvement if voluntary submission replaces the unyielding state. We discuss the vicissitudes of submission, and suggest that it could be further studied in the context of a randomised trial between enhanced submission to God and standard psychotherapy.

This Symposium has been endorsed by the WPA Psychotherapy Section (44) as an official activity.

**Objectives**

Unprecedented changes in the range and scale of immigration patterns over the past century have dramatically altered cultures and demographics all over the world. Thus we must better equip our trainees to effectively understand cross cultural issues, especially in the challenging and nuanced realm of psychotherapy. This Symposium reviews pertinent experiences in such training and offers practical suggestions.

**AN OVERVIEW OF ISSUES IN COMPETENTLY TEACHING CROSS-CULTURALLY COMPETENT PSYCHIATRY**

**INSTITUTIONS**

3. Daniel Wilson¹, Dr., D, PhD

Background: The Accreditation Council for Graduate Medical Education (ACGME) in the US requires education about sociocultural issues. As global economies, communication technologies, and the frequency of travel between continents continue to expand, immigration patterns change national demographics and cultures. Clinicians are often asked to treat cross cultural patients. Therefore it is a necessity to equip our trainees with understanding of the cross cultural issues in diagnosis and treatment. Achieving competence in this is especially difficult in the highly nuanced realm of psychotherapy.

Method: In the USA, 43% of all psychiatry residency positions are filled by international medical graduates. The authors will present information for teaching culturally competent psychotherapy to such cross-cultural residents. We reviewed contemporary literature about acculturation challenges, notably understanding culturally mediated defenses, resistances, transferences and counter-transferences.

Results: Psychotherapy training of culturally diverse residents requires understanding their home culture and culture of site of training. Such training is facilitated by supervisors adopting a non-judgmental supportive approach, appreciating and validating (if relevant) residents’ culture-specific observations as well as interpreting transfers or boundary issues. The availability of mentoring as well as cross-cultural psychotherapy seminars tailored can enhance psychotherapy knowledge, skills and experiences. Integration of pharmacotherapy and psychotherapy curriculum is also valuable.

Conclusions: The model discussed may help to cross cultural clinicians provide effective education for culturally competent training of cross-cultural clinicians.

TORTURE II

INSTITUTIONS
1. MUW, Vienna, Austria

AUTHORS
1. Thomas Wenzel

Section Symposium II for Section Psychological Consequences of Torture & Persecution torture and related forms of extreme social violence, such as civil war and terrorism, can be seen as the most relevant and far ranging mental health risks besides poverty. A spectrum of relevant information that is frequently neglected, is presented in the symposium.

THE CONVENTION AGAINST TORTURE AND OTHER CRUEL, INHUMAN OR DEGRADING TREATMENT OR PUNISHMENT – FURTHER CONSIDERATIONS

INSTITUTIONS
1. IRCT, Copenhagen, Denmark

AUTHORS
1. Bent Soerensen, Dr., Prof., bs@irct.org

The prohibition against torture is anchored in a series of international conventions, either focusing on torture or mentioning torture. Both article 5 of the Universal Declaration of Human Rights and article 7 of the International Covenant on Civil and Political Rights, provide that no one may be subjected to torture or to cruel, inhuman or degrading treatment or punishment. Further documents include the Declaration on the Protection of All Persons from Being Subjected to Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment, adopted by the General Assembly on 9 December 1975, the Convention against Torture (CAT, Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment), that entered into force 26 June 1987, and more recent documents such as the European Convention for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment (Strasbourg, 26.XI.1987). In the recent political development, some articles of the CAT, especially 20 and 22, have gained special relevance and will be discussed here.
THE ISTANBUL PROTOCOL AND PSYCHIATRY

INSTITUTIONS
1. Medical University of Vienna, Dept. General and Biological Psychiatry, Vienna, Austria

AUTHORS
1. Fabian Friedrich, Dr., fabian.friedrich@meduniwien.ac.at
2. Marion Freidl, Dr., marion.freidl@meduniwien.ac.at

The Istanbul Protocol (IP, Manual on the Effective Investigation and Documentation of Torture and. Other Cruel, Inhuman or Degrading Treatment or Punishment) is the new recommended training standard of the United Nations. The importance of the document can be seen in:
1) Provision of a consensus standard and quality assurance in documentation of torture sequels,
2) The creation of awareness in regard to torture, its impact, and the need for justice,
3) Distribution of knowledge on torture, and
4) Creating awareness of the needs of survivors during the interview and important psychological aspects of the interview process.

The mental health part of the interview is of crucial importance and reflects a differential and complex understanding of the impact of torture. The implications of the mental health part and strategies for teaching and implementation are presented in this study. A special aspect is the option of seeing the evaluation process as an option to integrate the memories of torture and contribute not only to personal and general justice, but to healing through testimony, a salutary effect that is also the aim of specific therapeutic strategies that had been developed to treat survivors of torture. Asylum procedures are a special case of the implementation of the protocol, and will be addressed as possible risk and opportunity for survivors.

INTERNATIONAL HUMANITARIAN AGENDA AND MENTAL HEALTH ADJUSTMENT

INSTITUTIONS
1. UNICEF, DHR/ Emergency Focal Point, United States

AUTHORS
1. Rosa Izquierdo Rodriguez, rosa.izquierdo.r@gmail.com

International organizations play a critical role in the way local populations and helpers cope with trauma.

How people react to potentially traumatic situations depends on their nature, the individual differences, degree of social support and the institutional role.

Most interventions in Europe, LAC, Africa, Asia and Middle East still focus on providing mental health services instead of strengthening the individual and social capacity to respond to crisis and emergencies. Helpers coping mechanisms are different to mental health adjustment strategies of the populations they serve.

Different case scenarios i.e. local population is a target versus helpers being targets. What motivates someone to become a helper? How can these motivations be integrated into the way helpers and their families cope with stress and distress? What are the key mental health/well being parameters of the helper and local population interaction?

This presentation will focus on mental health programmes implemented by International Organizations, Governments and mental health professional associations worldwide. Concrete examples from presenter’s professional practice in Middle East, Basque Country to Africa and South America, including natural and human made disasters will be discussed.

NEUROPHYSIOLOGY IN PSYCHIATRY: STANDARDIZATIONS, TRAININGS AND CERTIFICATIONS

INSTITUTIONS
1. Wayne State University School of Medicine, Department of Psychiatry and Behavioral Neurosciences, Detroit, United States
2. University of Naples SUN, Department of Psychiatry, Naples, Italy

AUTHORS
1. Nash Boutros¹, Dr, MD, nboutros@med.wayne.edu
2. Silvana Galderisi², Prof, MD, PhD, sgaldieri@tin.it

In spite of the increasing evidence that electrophysiology can have important clinical and research applications in Psychiatry, currently the majority of psychiatry residents do not receive an adequate training in electrophysiology and most psychiatrists are unfamiliar with clinical electroencephalography and its applications in the management of psychiatric problems. Experts in the field will describe the situation in different countries and provide possible solutions to overcome such an important gap in the training of specialists in Psychiatry.

STANDARDIZATION, TRAINING AND CERTIFICATION: CURRENT STATE IN THE USA

INSTITUTIONS
1. Wayne State University School of Medicine, Department of Psychiatry and Behavioral Neurosciences, Detroit, United States

AUTHORS
1. Nash Boutros¹, Dr, MD, nboutros@med.wayne.edu

Currently, psychiatry residents do not receive any training in electrophysiology. Most psychiatrists are unfamiliar with the clinical EEG and its applications in managing psychiatric problems. The rapidly advancing computer technology enabled sophisticated analyses of the EEG, evoked potential and sleep signals. It is very likely that in the near future such technology will impact the clinical practice of Psychiatry. We now propose a two months rotation during the residency and a one year clinical or a two-year clinical/research fellowships dedicated to training clinicians on all the necessary concepts and skills to develop a cadre of Clinical Electrophysiologists serving the needs of the psychiatric community.
In Germany, training in electrophysiology for medical doctors is commonly provided by neurological or psychiatric hospitals. The qualification to perform the training of the medical doctors is appointed to medical doctors personally. They are accredited by the German Society for Clinical Neurophysiology and functional Imaging. The education comprises theoretical teaching, performing EEG recordings and evaluation and interpretation of a specific number of EEGs. The medical doctors completing this curriculum receive an EEG certificate, which is mandatory for reimbursement by the health insurance for electrophysiological recordings. To receive a degree of psychiatrist specialization the educational institute must certify some EEG education of the students, but it is not any more specified exact what this education should include. However, the majority of German psychiatrists never receive a proper training in electrophysiology and therefore is more or less unfamiliar with EEG and its clinical applications in Psychiatry. Neurologists are mostly adequately trained in EEG procedures and clinical applications. Especially for psychiatrist the standardization of recording procedures is not yet satisfactory. In Switzerland, the electrophysiological education and training is similar to the one in Germany albeit somewhat less regulated.

Contrary to the current trend to reduce the EEG education especially in Germany, the core curriculum of psychiatrists should include education on the proper use of EEG in diagnosis and management of patients with psychiatric disorders and the acquisition of basic skills in qualitative and quantitative EEG and Event-Related Potentials recording and interpretation.

In Canada, there is only one centre for full-time training in electrophysiology technology leading to a diploma of technology in Canada. This is the British Columbia Institute of Technology in Burnaby. This is a two year full time program with four levels, each 15 - 20 weeks with the following program matrix: anatomy, physiology and neurosciences, neurology, electroneurophysiology, mathematics, statistics, physics, human behaviour, clinical EEG and evoked potentials. Examples will be given of the use of quantitative EEG, brain mapping and source localization to help with diagnostic problems, using centroid analysis, discriminant functions and LORETA sources in depression, schizophrenia, chronic fatigue syndrome and male to female transsexualism.
STANDARDIZATION, TRAINING AND CERTIFICATION IN TURKEY

INSTITUTIONS
1. Cerrahpasa Medical Faculty, University of Istanbul, Department of Psychiatry, Istanbul, Turkey

AUTHORS
1. Kemal Arikan¹, Dr, MD, mkarikan@doruk.net.tr

It is universally acknowledged that standardization, training, and certification are core issues in electrophysiology. The importance of these components stems not only from clinical applications but also from the scientific use of the electrophysiological tools. In Turkey, I would like to summarize the issues in two parts: one is as it pertains to neurology, the other is in psychiatry. In neurology, standardization and training is pretty well established. All neurologists are automatically certified if they spend some time in their EEG units during residency training. In psychiatry, unfortunately, none of the components are well established.

STANDARDIZATION, TRAINING AND CERTIFICATION IN ITALY

INSTITUTIONS
1. University of Naples SUN, Department of Psychiatry, Naples, Italy

AUTHORS
1. Silvana Galderisi¹, Dr, MD, sgalderi@tin.it
2. Umberto Volpe¹, Dr, MD, umberto.volpe@unina2.it
3. Armida Mucci¹, Dr, MD, armucci@tin.it

In Italy training in electrophysiology for medical doctors is provided by postgraduate schools of specialization in Clinical Neurophysiology or in Neuropathophysiology. However, the degree obtained from these schools is not mandatory for EEG recording and interpretation, as also other medical doctors experienced in the field can take this responsibility. The majority of Italian psychiatrists never receive a training in electrophysiology and therefore are unfamiliar with EEG and its clinical applications in Psychiatry. Neurologists are in many, but not in all, cases trained in EEG procedures and clinical applications. The standardization of recording procedures is not yet satisfactory. The core curriculum of psychiatrists should include education on the proper use of EEG in diagnosis and management of patients with psychiatric disorders and the acquisition of basic skills in qualitative and quantitative EEG and Event-Related Potentials recording and interpretation.

6. A Waterreus
7. G Valuri
8. H Stain
9. P McGuffin
10. A Farmer

Aim: To describe the development, reliability and applications of the Diagnostic Interview for Psychoses (DIP), a comprehensive interview schedule for use in epidemiological and clinical studies.

Methods: The DIP requires 60 to 90 minutes to administer and encompasses 4 main domains: (a) demographic data; (b) social functioning and disability; (c) a diagnostic module comprising symptoms, signs and past history ratings; and (d) patterns of service utilisation and patient-perceived need for services. It generates diagnoses according to several sets of criteria using the OPCRIT computerised diagnostic algorithm.

Results: The DIP is easy to use and well tolerated in the field. For the diagnostic module, inter-rater reliability was assessed on 20 cases rated by 24 clinicians: good reliability was demonstrated for both ICD-10 and DSM-III-R diagnoses. Seven cases were interviewed 2-11 weeks apart to determine test-retest reliability, with pairwise agreement of 0.8-1.0 for most items. To test validity, 10 cases were jointly assessed using the DIP and SCAN: in 9 cases clinical diagnoses were in agreement.

Conclusions: The DIP is suitable for use in large-scale epidemiological studies of psychotic disorders, as well as in smaller studies where time is at a premium. While the diagnostic module stands on its own, the full DIP schedule, covering demography, social functioning and service utilisation makes it a versatile multi-purpose tool.
DIMENSIONAL AND CATEGORICAL ASSESSMENT OF AGORAPHOBIA

INSTITUTIONS
1. University of Sydney, Discipline of Psychological Medicine, Sydney, Australia
2. Nepean Anxiety Disorders Clinic, Penrith, Australia
3. Nepean Hospital, Department of Psychological Medicine, Penrith, Australia

AUTHORS
1. Vladan Starcevic1, Dr., starcev@wahs.nsw.gov.au
2. David Berle2
3. Anthony Hannan2
4. Denise Milicevic2
5. Claire Lamplugh2
6. Pauline Fenech3

Aim: To compare categorical and dimensional assessment of agoraphobia, a condition in which there is uncertainty and some disagreement about the extent of avoidance needed to justify the corresponding diagnosis. Dimensional measures assess only agoraphobic avoidance, whereas categorical assessment takes into account the extent of avoidance and endurance of agoraphobic situations with anxiety or distress when there is no avoidance, and allows the diagnosis of agoraphobia to be made on the basis of either of these criteria.

Method: Two patient self-report dimensional measures of agoraphobic avoidance (Mobility inventory and Phobic Anxiety subscale of the Symptom Checklist 90-Revised) were administered to 101 patients diagnosed with panic disorder with and without agoraphobia by means of a categorical instrument, the Mini International Neuropsychiatric Interview. The diagnosis of agoraphobia was assigned only to patients with prominent avoidance behaviour of multiple situations.

Results: Patients with a categorical diagnosis of agoraphobia scored significantly higher on both dimensional measures of agoraphobic avoidance than patients without a categorical diagnosis of agoraphobia. This confirmed the validity of our categorical diagnosis of agoraphobia.

Conclusions: Dimensional and categorical instruments are both useful in the assessment of agoraphobia. Categorical instruments are necessary to formally establish the diagnosis of agoraphobia, whereas this diagnosis cannot be made solely on the basis of a dimensional assessment of agoraphobic avoidance. However, use of dimensional instruments provides the clinically important information on the extent of agoraphobic avoidance without which the categorical DSM-IV-based diagnosis of agoraphobia might not be as meaningful in its own right.

DIAGNOSIS AND ASSESSMENT OF SOMATOFORM DISORDERS: FACTS AND CONTROVERSIES

INSTITUTIONS
1. University of Western Australia, School of Psychiatry and Clinical Neurosciences, Perth, Australia

AUTHORS
1. Aleksandar Janka

Background: From the very moment of their inclusion in the contemporary diagnostic systems in psychiatry, the concept of somatoform disorders became a matter of controversy that created an ongoing debate about their validity, reliability and suitability in clinical and research settings.

Aim and method: This presentation will be based on the analysis of recent studies in the area of somatoform disorders and focus on some controversial issues related to their diagnosis and assessment in particular cultures and settings.

Results and conclusions: Much research has recently been conducted on epidemiology of somatoform disorders, demonstrating their clinical importance, associated health-service burden and economic cost. These conditions are often comorbid with other mental and physical disorders and particularly prevalent in primary care and general medical settings. Although culture-specific manifestations and variations of somatisation occur, it is now accepted that medically unexplained somatic symptoms are a universal phenomenon. The management of somatoform disorders is generally a complex and lengthy process; however, a number of recent studies have demonstrated the effectiveness of short-term treatments such as cognitive behaviour therapy and educational interventions [1]. Despite advances in their understanding and treatment, debate still surrounds the conceptualisation and categorisation of somatoform disorders, with a number of experts proposing a complete re-evaluation and reassignment of this diagnostic classification category [2].

ASSESSMENT OF PERSONALITY DISORDERS: FROM THEORETICAL CONCEPTS TO REAL-LIFE PITFALLS

INSTITUTIONS
1. School of Medicine, Aristotle University of Thessaloniki, 3rd Department of Psychiatry, Division of Neurosciences, Thessaloniki, Greece

AUTHORS
1. Kostas Fountoulakis

The assessment of psychopathology related to personality disorders manifests several pitfalls and problems due to a variety of reasons. A core problem is a problem of definitions. The concept of personality itself and its facets and domains are vaguely defined and under dispute. Much of the related concepts and phenomena are ill-defined, based on vicious cycles of thoughts or are difficult to assess objectively, especially those related to the existential side of being and inner self and values. Social, legislative, political, philosophical, religious and cultural factors further perplex the issue. Most methods and instruments carry an inherent bias; interviews carry the bias of counter-transference, peers might be affected by a social and interpersonal bias, while self-report tests reflect more the way the individual perceives the image the other people have of him/her than true personality. Overall, different methods and approaches often produce conflicting results, frequently making the assessment of personality characteristics difficult and with problematic reliability and validity.

ISSUES IN THE ASSESSMENT OF PSYCHIATRIC DISORDERS IN DEVELOPING COUNTRIES

INSTITUTIONS
1. University of Western Australia, School of Psychiatry and Clinical Neurosciences, Fremantle/Perth, Australia

AUTHORS
1. Mohan Isaac

Background: Most developing countries are constrained by severe shortage of trained mental health professionals. The shortage affects not only mental health service delivery but also research and training in the field of mental health. The quantum of research and publications on various aspects of mental health from developing countries represents only a small fraction of the worldwide research. Difficulty in standardized and acceptable assessment of psychiatric disorders is one among several factors that contribute to the dearth of research and publications from developing countries.

Aim and method: Based on the author’s two decades of experience working at a leading research and training institution in the developing world, the presentation will highlight a variety of issues in the assessment of psychopathology in developing countries.

Results and conclusions: There are various cultural factors and factors related to real life situation in developing countries, which influence the manifestation and measurement of psychopathology. In addition, significant issues exist with regards to the translation, adaptation and standardization of measurement instruments developed in the West, as well as problems in the construction and development of locally relevant and meaningful assessment instruments.

This is a joint session between the Disaster Psychiatry section and the section on Anxiety and OCD, aimed at highlighting new insights regarding effective intervention after disasters. This symposium would be unique, since it encompasses both new diagnostic conceptualization of the psychological response to trauma, as well as new translational insights to intervention, along with a specific focus on children in disasters.

**ANXIETY BY DISRUPTION AND PTSD IN DISASTERS**

**INSTITUTIONS**
1. Maimonides University, Psychiatry and Neurosciences, Buenos Aires, Argentina

**AUTHORS**
1. Gustavo E. Tafet¹, Dr., MD, PhD, psychiatry@maimonides.edu

It has been shown that psychosocial stress is involved in the origin and development of different anxiety disorders. Upon certain environmental conditions, characterized by extreme, unexpected and unwanted, environmental changes, it has been observed a new clinical presentation, which would not be directly related to distressful events but to the disruptive environment, therefore constituting the Anxiety by Disruption Syndrome (ADS).

It has been shown that under distressful environmental conditions, people exposed to a potentially traumatogenic environment may develop different clinical conditions, including PTSD, GAD and ADS. In this regard, we observed clear differences between these syndromes, both at the clinical and the psychoneuroendocrinological levels, particularly focusing on the HPA axis.

According to our observations, the ADS represents a clearly different anxiety disorder, therefore allowing more accurate diagnosis and more adequate treatments for the suffering patients and their psycho-social environment.
TRANSLATIONAL RESEARCH: AN INNOVATIVE APPROACH TO INTERVENTION RIGHT AFTER EXPOSURE

INSTITUTIONS
1. Chaim Sheba Medical Center, Psychiatry, Tel Hashomer, Israel
2. Tel Aviv University, Sackler School of Medicine, Tel Aviv, Israel

AUTHORS
1. Joseph Zohar1,2, Prof., MD, jzohar@post.tau.ac.il

PTSD is unique among anxiety disorders, as there is a clear point of onset. Since the symptoms are often expressed right away, theoretically there is a “window of opportunity” to intervene. The challenge is to find out if and what early intervention at this point is effective.

Cortisol - the “stress hormone” is a cornerstone in the normal response to trauma. The importance of an intact HPA axis in regard to vulnerability to PTSD was tested in an animal model of PTSD using rats with hyper- (Fischer), or hypo- (Lewis) reactive HPA axis. The study showed that plasticity of the HPA axis is critical for recovery from trauma.

Along those lines, the potential usefulness of an early administration of cortisol as a potential therapeutic tool after exposure to trauma will be presented.

EURO-MEDITERRANEAN NETWORK FOR PSYCHOLOGICAL SUPPORT TO TRAUMATIZED CHILDREN BY DISASTERS OR WAR

INSTITUTIONS
1. Hospital Necker, SAMU, Paris, France

2. Juan J López Ibor2, Dr., MD, PhD

The “Child Trauma Network” is a consortium of psychiatrists and psychologists of ten Euro-Mediterranean countries (Algeria, Belgium, Egypt, France, Italy, Lebanon, Morocco, San Marino, Spain, Tunisia and Palestine) with the purpose of exchanging knowledge in order to better identify the clinical manifestations of children traumatized by disasters or war and to improve the examination procedures and the evaluation instruments scales. The final aim is to reinforce cooperation and support needed when confronted by such events.

Throughout two years of several joint meetings, the consortium has analysed the scientific evidence, made the record of the different clinical manifestations and selected specific tests and scales for clinical evaluation, in order to elaborate an instrument for teaching and practice. This tool has the format of a handbook for the interview, the evaluation and the psychological support of traumatized children. This material has been tested by a group of young psychiatrists and psychologists before reaching its final form.

The consortium has taken care of intercultural differences and ethical issues, with special consideration on the equality in access to care of girls and boys.

Lastly, the consortium has created a web-site in order to facilitate the communication between partners and is preparing the dissemination of the experience through a program of e-learning.

The “Child Trauma Network” has been involved in teaching or in psychological intervention, in several events as earthquakes in Algeria and Morocco, wreck in Egypt, terrorist attempts in Algeria, Egypt, Morocco, Tunisia and Spain, and war in Lebanon and Palestine.

In the last decades we witnessed major advances in the scientific knowledge about psychiatric disorders and their psychophysiological manifestations. The symposium will provide an update of psychophysiological findings in schizophrenia, and discuss their contribution to the understanding of neural mechanisms underlying the syndrome.

GATING MECHANISMS AND SCHIZOPHRENIA PSYCHOPATHOLOGY

INSTITUTIONS
1. Wayne State University School of Medicine, Department of Psychiatry and Behavioral Neurosciences, Detroit, United States

AUTHORS
1. Nash Boutros¹, Dr, MD, nboutros@med.wayne.edu
2. Darren Fuerst¹, Dr, MD

Background: The clinical correlates of sensory gating deficits in schizophrenia have eluded identification. This may have resulted from small sample sizes and limiting the examination to gating of the P50 auditory evoked response (AER).

Methodology: Fifty four chronic schizophrenia patients and 54 matched healthy controls, were included. All patients were stable on atypical antipsychotic medications. Patients were administered the SCID and PANSS interviews as well as the Wisconsin Card Sorting Test (WCST). All subjects had the standard paired-click paradigm (i.e, two identical 4ms clicks [S1 and S2] with 500 ms between stimuli and 8 seconds between the pairs of stimuli). Sensory gating was calculated for each evoked response as the ratio of S2/S1 and as the difference of S1-S2 amplitudes.

Results: The N100 ratio was significantly higher in schizophrenia patients. When covaried with the amplitude of the N100 S1 response, the abnormality remained significant. Neither the P50 nor the P200 gating indices survived the covariance with S1 amplitudes. The elevated N100 S2/S1 ratio correlated mainly with negative symptoms (e.g., decreased volition and motor retardation). For the WCST, the number of total correct responses correlated positively with amplitude of the P50. The number of perseverative errors correlated with decreased gating of the P200.

Conclusions: The data suggest that N100 gating is abnormal in schizophrenia patients even when stable on medications and that the abnormality is not secondary to an abnormal response to S1 stimuli. The data also suggest a correlation between negative symptoms and N100 gating deficit.
THE ROLE OF LANGUAGE IN SCHIZOPHRENIA

INSTITUTIONS
1. University of Bern, Department of Psychiatry, Bern, Switzerland

AUTHORS
1. Werner K Strik, Dr, MD, werner-konrad.strik@puk.unibe.ch

Many of the most typical symptoms of schizophrenia are language related. In particular, formal thought disorders can be understood as errors in logical, semantical and associative language processing. Further, the typical schizophrenic hallucinations are language related. Several recent studies pinpointed the functional and neuroanatomical correlates of language related symptoms in terms of regional activity and structural changes of the left hemispheric language circuit.

An overview of these results based on different methods including structural and functional MRI, DTI, ASL and evoked potentials will be presented showing that there is not one single local alteration explaining all language related symptoms. Rather the symptoms can be best explained by a distinct pattern involving structural deficits and signs of a functional imbalance. The available evidence allows to formulate an integrative model of formal thought disorders and hallucinations in schizophrenia and also to provide a psychobiological rationale for subtyping of schizophrenia.

SCHIZOPHRENIA AND MISMATCH NEGATIVITY IN THE VISUAL DOMAIN

3. Jan Kremláček, Dr, PhD, jan.kremlacek@lfhk.cuni.cz

Introduction: The advance in methods of biological psychiatry is being used in an attempt “to deconstruct” schizophrenia either into a number of separate nosological units or into processes that in combination bring about the clinical presentations of schizophrenia. The important position in this effort may have the evaluation of the nature of the impairment of information processing and the significance of cognitive dysfunction in schizophrenia. The Mismatch negativity (MMN) is a negative deflection of amplitude in the course of an auditory event related potentials (ERPs), that is elicited by a deviant stimulus in a repetitive sequence of standard stimuli. Among patients with schizophrenia the MMN is smaller than in controls and associated with chronicity, deficits in functioning and morphological brain changes.

Methods: We investigated the ERP to visual motion stimuli in a group of 24 patients with schizophrenia or schizoaffective disorder and matched healthy controls. The standard and deviant stimuli were presented as fast motion (50 deg/s) in the peripheral visual field. The standard stimulus consisted of 200 ms of upward motion, the deviant stimulus was the downward motion of the same duration. Four recording sessions, each consisting of 170 stimulus presentations; 150 standard, 10 deviant and 10 target were run.

Results: A significant MMN reduction was present in the subgroup of patients with the deficit syndrome of schizophrenia.

Conclusion: Our findings support the hypothesis that a disturbance of early (preattentive) cognitive processes among patients with schizophrenia is present also in the visual modality.
EVENT-RELATED POTENTIALS IN SCHIZOPHRENIA

INSTITUTIONS
1. University of Naples SUN, Department of Psychiatry, Naples, Italy

2. Silvana Galderisi1, Dr, MD, sgalderi@tin.it
3. Mario Maj1, Dr, MD, majmario@tin.it

Aims/Objectives: Abnormalities of the event-related potentials (ERPs) were consistently found in schizophrenia and thought to reflect a disturbance of brain integrative functions. The influence of several clinical features, including negative symptoms, thought disorder, illness duration and age of onset, remains controversial. The presence of enduring, primary negative symptoms might identify a separate disease entity within schizophrenia, the deficit schizophrenia (DS). We tested the hypothesis that patients with DS differ from those with nondeficit schizophrenia (NDS) relative to different ERP components.

Methods: ERPs were recorded during a three-tone oddball task in clinically stable patients with DS or NDS and matched healthy controls (HCS). Scalp topography and cortical sources, as assessed by low-resolution electromagnetic tomography (LORETA), were measured for N1 and P3 ERP components. The amplitude and latency of the mismatch negativity (MMN) were also measured from the difference waveforms (Target - Standard and Novel - Standard).

Results: For N1, only patients with DS showed amplitude reduction and reduced current source density. For P3, only patients with NDS showed a lateralized amplitude and current source density reduction. The MMN was reduced for attended Targets in DS vs. HCS. The two patient groups differed significantly with respect to N1 and MMN amplitude, N1 topography, as well as P3 amplitude and cortical sources.

Conclusion: Our results support the view that deficit and nondeficit schizophrenia represent different disease entities. According to our findings, N1-related processes are affected in DS, while P300-related processes are disturbed in NDS.

ELECTROPHYSIOLOGICAL ENDOPHENOTYPES IN THE STUDY OF SCHIZOPHRENIA

INSTITUTIONS
1. Ludwig-Maximilians-University of Munich, Department of Psychiatry, Munich, Germany

A considerable number of brain neuroelectric parameters are highly heritable, which is especially true for event related potentials (ERP) such as the P300. Abnormalities have been reported in various psychiatric disorders, and consequently the P300 has been suggested as a promising endophenotype for genetic research. Although there is increasing evidence favoring the recognition of psychiatric disorders such as schizophrenia as hereditary disorder, the identification of genes involved, however, is challenging, probably due to the biological heterogeneity of clinical psychiatric diagnoses. Endophenotypes or intermediate phenotypes might provide distinct, objective biological measures for identifying traits or facets of clinical phenotypes, as well as presumable consequences of genetic aspects.

Numerous studies using EEG/ERP recordings revealed differences between healthy subjects and patients with schizophrenia in terms of brain information processing. Electrophysiological data will be presented and discussed with respect to their use as potential candidates for an “endophenotype approach” to this major psychiatric disorder. Genetic aspects presumably associated with both the diagnosis of schizophrenia or the generation of electrophysiological measures, such as event related potentials, will be taken into account.
ON THE RECEPTION OF BLEULER’S CONCEPT OF SCHIZOPHRENIAS IN EUROPE

FROM DEMENTIA PRAECOX TO THE GROUP OF SCHIZOPHRENIAS: KRAEPELIN, BLEULER AND 21ST CENTURY PSYCHIATRY

INSTITUTIONS
1. University of Zurich, Dept. of Social and General Psychiatry, Zurich, Switzerland

AUTHORS
1. Paul Hoff1, Prof., MD PhD, paul.hoff@puk.zh.ch

Emil Kraepelin’s and Eugen Bleuler’s concepts of severe psychotic disorders are often regarded as mainly opposing each other. Although there was, on the one hand, a lot of competition, there also are, on the other hand, remarkable similarities between both authors, e.g. the theoretical framework of naturalism. This paper will elucidate the main ideas of both concepts and compare them with each other. Apart from this historical aspect, the relevance of Kraepelinian and Bleulerian arguments for the present day debate on schizophrenia will be discussed. The focus herein will be on the fact that - disregarding the different kind of scientific language being used 100 years ago - many of Kraepelin’s and Bleuler’s central questions are still of crucial importance for the ongoing debate on the “nature” of schizophrenic disorders at the beginning of the 21st century.
EUGEN BLEULER’S CONCEPT OF SCHIZOPHRENIAS AND PSYCHIATRIC CLINICS IN PRAGUE

INSTITUTIONS
1. Charles University Medical School, Psychiatric Department and Clinic, Prague, Czech Republic

AUTHORS
1. Jan Libiger¹, Prof., MD, libigerj@lfhk.cuni.cz
2. P Baudis¹, MD

Early in 1926 the meeting of the Czech Society for Study of the Mind and Nerves in Brno focused on the subject of Schizophrenia. As Prof. Vondrácek recollects, the meeting reached the conclusion to support the usage of the term schizophrenia in the sense of Eugen Bleuler instead of the still frequent Kraepelinian term Dementia praecox. However Prof. Heveroch warned that the clinical aptness of dementia praecox will be missed by everyone with a clinical intuition and warnings were spelled out to prevent using the schizophrenia term without careful analysis to avoid diluting its significance. Prof. Karel Kuffner on the other hand suggested a wide application for the term schiziform disorder. At the time, psychiatry in Prague was bilingual, the German Psychiatric Clinic and Czech Psychiatric Clinic shared the same building, that was dedicated to clinical psychiatry in 1848 and has been in service ever since, until today. Czech and German Clinics took turns in securing Sunday emergency admissions in Prague. The comparatively early acquisition of Bleuler’s concept of schizophrenia was parallel and bilingual in former Czechoslovakia. Among the German professors were the personalities who had a shaping influence on world’s psychiatry, like Arnold Pick and personalities who maintained the psychiatric links between Prague and Vienna, like Otto Pötzl. Their Czech counterparts Karel Kuffner and Antonín Heveroch had opposing temperaments and a background that relied also on the French tradition in psychiatry. This presentation traces how mutual influences of German and Czech psychiatric community participated in spreading the Bleulerian concept of Schizophrenia.

THE EARLY RECEPTION OF BLEULER’S CONCEPT OF SCHIZOPHRENIAS IN VIENNA

INSTITUTIONS
1. Otto Wagner Hospital, Vienna, Austria

AUTHORS
1. Eberhard Gabriel¹, Prof., MD, eberhard.gabriel@wienkav.at

As early as in January 1912 Erwin Stransky (1877-1962) told the audience about Bleuler’s concept on the group of schizophrenias in a meeting of the Association of Psychiatry and Neurology in Vienna (founded in 1867/68, the then representative psychiatric association in Austria). Julius Wagner-Jauregg (1857-1940), then holding the chair of psychiatry and neurology in the Vienna University Medical School, and Josef Berze (1866-1957) were the discussants whose extensive remarks were published together with the lecture of Stransky in the official journal of the association: the Jahrbücher für Psychiatrie und Neurologie (vol. XXIII, 1912). Stransky and Berze were - and went on to be - known for their contributions to the teaching about dementia praecox and later on schizophrenia. The remarks of Wagner-Jauregg are among the few witnesses of his psychiatric nosological teaching and therefore of special interest with regard to nosography as the understanding of the disorders as well. The reception of Bleuler’s concept was a critical one, not at least with regard to his psychodynamic understanding of the disorders. Nevertheless the common use of the term (if not: of the notion) was growing after World War I, see Berze (then directing the psychiatric hospital in Vienna, and H.W. Gruhle): “Psychologie der Schizophrenie” of 1929 and the decline of ‘dementia praecox’ in its use in psychiatric practice.
THE INFLUENCE OF BLEULER’S CONCEPT OF SCHIZOPHRENIA ON SCANDINAVIAN PSYCHIATRY

INSTITUTIONS
1. University of Oslo, Department of Psychiatry, Oslo, Norway

AUTHORS
1. Stein Opjordsmoen, Prof., MD, o.s.e.ilner@medisin.uio.no

The influence of the work of Eugen Bleuler in Scandinavia has been considered based on clinical experience, scientific articles, monographs and textbooks. In Scandinavia the opinion has been held that Kraepelin’s concept of “dementia praecox” described a serious mental disorder with bad prognosis. Bleuler (1911) widened the concept by introducing his term “the group of schizophrenias” and thereby pointed to the diversity of the disorder. Langfeldt’s concept of schizophreniform psychosis as different from core schizophrenia, reactive psychosis, paranoia, and manic-depressive illness was in line with this notion. Research has shown that there are roughly still four different outcome groups of schizophrenia according to modern diagnostic criteria. Moreover, in spite of the common use of ICD-10 and DSM-IV, Bleuler’s syndromatological description of schizophrenia with essential symptoms (association (thought) disturbance, autism, affective flattening, ambivalence) and accessory symptoms (hallucinations, delusions) is still central in Scandinavian textbooks of psychiatry. His description has been taken as more in line with psychodynamic theory than earlier concepts which has been welcomed in most parts of Scandinavia. Bleuler’s statement of schizophrenia as a heterogeneous disorder with typical symptoms is still alive in Scandinavia today.

The evolution of contemporary psychiatry is moving towards the integration of a variety of diverse disciplines, towards the integration of various professionals and other therapists in the field of care. This approach carries the risk of watering-down any consensus and therefore the challenge is to set up a structure based on modern thinking and to open up to new practices. With the other participants we would like to reflect on this challenge and demonstrate how - in certain conditions and with a resolutely modern view - psychoanalysis can hugely and usefully contribute to this renaissance in psychiatry. We will diverge from our normal practice to share with you our current idea of an integrative approach that we see as a truly constructive process: from the moment of the evaluation and pronouncing a diagnosis, but also throughout the whole course of treatment for long-term patients.
DIAGNOSIS AS A JOINT RE-CONSTRUCTION PROCESS

INSTITUTIONS

AUTHORS
1. Ayça Gürdal Küey¹, Dr, MD, aycagurdal@yahoo.com
2. Levent Küey², Associate Professor, MD, kueyl@superonline.com

Diagnosis in psychiatry, as a formulation and as a joint re-construction process between the clinician and the patient, is essential in clinical care. Consequently, a two-fold task is faced. On one hand, the clinician is in need of making a comprehensive diagnostic assessment to construct a valid and working formulation of the patient's situation and a treatment plan, and on the other, the bases for a psychotherapeutic alliance should be established. Besides being one of the primary paradigms in psychiatry, the theory and practice of psychoanalysis, offer considerable contributions to the clinician in managing these tasks.

Understanding the meaning of the human suffering through empathy in a judgment free milieu is essential in the establishment of rapport, compliance and for a better clinical outcome. Basic concepts of psychoanalysis, with particular attention to intrapsychic and interpersonal conflicts, and the related psychotherapeutic skills could be useful for mental health professionals in various clinical settings, especially in an era of algorithmic treatment guidelines.

As a part of this workshop, this presentation will discuss the complexity of diagnostic process in psychiatry and emphasize the contributions of psychoanalysis in this process. Brief clinical vignettes from the authors' clinical practice will be used to broaden the scope of discussion. Such a discussion on integrative approaches may be appealing, especially to young psychiatrists.

INTEGRATION FOR WHOM? FOR WHAT REASON?

The present trend towards an integrative type of psychiatry gives rise to much reflection. We will see here how psychoanalysis can play an important role in this debate: used in a contemporary manner it becomes the guarantor of the complexity of psychopathology and can be a factor for coherence. Although the bio-psychosocial model described by Engel is widely used in the domains of medicine and psychiatry, in today's world it appears to lack a solid theoretical basis.

It has been useful for drawing up out-patient guidelines, which at the time appeared to represent a profound change in the world of psychiatry. However, in view of the progress of our knowledge, the explosion of care and the multiplicity of social approaches, we now need to completely rethink the links between the biological, the psychic, the social and the political. How do we ensure we don't get lost? How can we give to the patient the desire and the chance to be in the centre of the treatment, to be fully the person he really is? How can we build up a strong identity for psychiatry? How can we avoid splitting the objective aspects of psychopathology from those which inspire the therapist to become involved as a person? How can we keep going during treatments that can be long and difficult with sometimes thankless results for the patient but which can be passionately interesting for the therapist?

We offer these suggestions to give a partial response to these questions and open the debate.

The clinical presentation of the obsessive-compulsive disorder (OCD) varies considerably. This diversity reflects different etiologic mechanisms and may have important treatment implications.

The goal of this presentation is to describe some existent strategies to deal with OCD heterogeneity such as identifying more homogeneous phenotypical categories and using dimensional measures and its treatment implications.

Under the categorical approach we will present recent findings of the phenotypic expression of OCD patients subdivided according to gender, age of onset of obsessive-compulsive symptoms, or presence of tics, and their specific response to different treatment approaches (group behavior therapy, serotonin reuptake inhibitors or neurosurgery). Likewise, we will show demographic data, the comorbidity expression and the treatment response (group behavior therapy, serotonin reuptake inhibitors or neurosurgery) of OCD patients when dimensional measures are used.

The optimal subdivision will be achieved only with the discovery of the etiology of the different components of what today we call OCD. As these etiological mechanisms associated to the expression of OCD are still unknown, there is probably not just one, but several good strategies that in combination may provide the best way to subgroup and treat OCD.
ADDICTION, IMPULSIVITY AND OCD - THE DIMENSIONAL SPHERE

INSTITUTIONS

2. University of Florence, Italy

AUTHORS
1. Stefano Pallanti1, Dr, stefano.pallanti@mssm.edu
2. Silvia Bernardi2, Dr, silvia.bernardi@gmail.com

As part of the Research Planning Agenda for the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition in obsessive-compulsive-related disorders, experts from academic medical centers around the world suggest the creation of a new diagnostic category that includes the behavioral and substance addictions. Chemical Addictions and Behavioral Addictions, characterized by impulsive choice, reward sensitivity, and fronto-striatal brain circuitry, with frontal lobe deficits, are conceptualized as a parallel category to OCD spectrum category.

Craving and Impulsivity, in fact, are complex phenomena that involve different brain circuitries and neurobiological factors. Both are present in different psychiatric disorders, with different clinical presentations and phenomenologies.

OCD TOWARDS ICD 11 – WHAT MAY REMAIN? WHAT MAY CHANGE? – DISCUSSION

INSTITUTIONS

### COERCION IN PSYCHIATRY

**INSTITUTIONS**
1. Queen’s University, Canada

**AUTHORS**
1. Julio Arboleda-Flórez, Prof.

In Ontario, Canada, a person can be committed involuntarily to a psychiatric facility if a physician is of the opinion that the person is mentally ill, dangerous to self or others or in need of treatment. Within the parameters of the law a person meeting these parameters can be committed involuntarily for 24 hours and up to 30 days with extensions if necessary. Commitment is highly regulated within the Law that stipulates not only the parameters, but the length and the controls to be applied to this highly controversial social control mechanism. This presentation will review findings from an analysis of a large data set of cases of civilly committed mentally ill patients. The analysis will focus on the demographic characteristics, clinical elements and length of commitment and legal peculiarities including legal decisions.
RECENT ADVANCES ON PSYCHOPHARMACOLOGICAL MANAGEMENT OF VIOLENT OFFENDERS

INSTITUTIONS
1. Belleville General Hospital, Academic Psychiatric Unit Queens University, Canada

AUTHORS
1. A. N. Singh

At present there is a remarkable lack of controlled and sophisticated drug studies for the management of selective target symptoms like violent behaviour, aggressiveness, anger or hostility. The sources of violent behaviour are multiple.

The recent advances in biological areas relevant to the management of violence in offenders include the a) limbic system, b) hypothalamus, c) the reticular information, d) the raphe system, and e) nigrostriatal systems. The effect of psychotropic drugs on the above systems has been the starting base of much of the past and present work. The philosophy for treating the violent offenders by drugs lies in accepting that symptoms are the first ones to be controlled but the aim is to treat the underlying etiology of aggressive behaviour. The effect of psychopharmacological agents on the above underlying etiologies of violence and aggressive behaviour usually lies in diseases of mostly a psychiatric nature or in personality disorder or in a combination of both.

Psychopharmacological agents have achieved marked success in controlling symptoms thought underlying etiological factors require further treatment depending upon the discovery of factors. These etiological factors might be independent of symptoms, disorders seen in patients or might have direct bearing to violence.

However, such treatment should neither be used for social control nor for the service of society. It is the individual patient whose benefit should be adhered to and it is his rights which we should respect.

CONFIDENTIALITY AND RISK-MANAGEMENT WITH VICTIMS OF INTIMATE PARTNER VIOLENCE

INSTITUTIONS
1. Universidad Complutense de Madrid, Spain

AUTHORS
1. Alfredo Calcedo
2. M. DE ICETA
3. D. ARBULO

Programa Atiende is a mental health team that attend victims of intimate partner violence (IPV) referred from the social services from all the Community of Madrid (6 millions). We have 400 new referrals every year including assessment of children of the women. Spanish society is highly sensible to IPV and very advanced legislation has been enacted in the last 5 years. However we have come across an ethical problem while treating our patients. There is a strong pressure on all health professionals when there is a suspicion of IPV to report to the police the situation, regardless the opinion of the patient. Feminist groups claim that victimised women suffering IPV find extremely difficult to have the strength to go to the police. Also the identification with the aggressor mechanism of defense prevents them from acting to defend themselves with the assistance of the authorities. On the other hand a significant number of professionals consider that the victimised women still are autonomous and retain the right to make a decision on such a delicate issue. The implications of both approaches will be discussed.
SELF-DESTRUCTIVE BEHAVIOR IN CRIMINAL POPULATIONS

INSTITUTIONS
1. Psychiatric Hospital Dr. Maurício Cardoso, Brazil

AUTHORS
1. Vivian Peres Day
2. A. Cataldo Neto
3. L. E. de Borba Telles

As usual, the researchers' focus of study concerning aggressive perpetrators, especially in prison or in psychiatric facilities is the violence risk and criminal recurrence. Nevertheless, it is observed different forms of aggressive behavior, is not rare self-destructive acts. It will be presented some data concerning findings, suicide rates, involving individuals under commitment or in prison, in both forensic institutions located in the very south of Brazil. It will be considered risk assessment, diagnosis and other characteristics involved.

VIOLENCE RISK ASSESSMENT: THE OTHER SIDE OF THE COIN IN BRAZIL

INSTITUTIONS
1. Universidade de Brasília, Brazil

AUTHORS
1. E. Abdalla-Filho

Earlier studies on violence risk assessment have focused on the potential violence of the patient/prisoner against society. Many checklists have been developed in order to enhance this kind of assessment and protect society more efficiently. While society must certainly be protected from criminals, the latter also deserve respect. Otherwise, society may be violent against them too. The author intends to highlight the forms of violence suffered by patients/prisoners in Brazil. For example, they may not receive suitable or adequate treatment; families may deny their support to criminal relatives; social or professional support may be insufficient or even absent. All these and other forms of violence may reinforce the possibility of reoffending.
FORENSIC PSYCHIATRY IN LATIN AMERICA

In the last years, Forensic Psychiatry made an enormous progress in Latin America. This symposium will deal with actual developments.

CURRENT CIVIL COMPETENCE EVALUATIONS IN PARAGUAY: TRYING TO SOLVE DIFFICULTIES FOUND IN INTERDICTION AND INHABILITATION TRIALS

The practice of forensic psychiatry must be developed and updated in Paraguay. With a recent tragically history, several applications of current laws need revision. All professionals, lawyer and mental health ones have its own misunderstandings, some of which are treated in this paper. Possible solutions for the misunderstandings are proposed.
TREATMENT OF SEX OFFENDERS IN LATIN AMERICA: UTOPIA?

INSTITUTIONS
1. Universidad Central, Venezuela

AUTHORS
1. R. Hernandez-Serrano

This is a very important topic especially in Latin America and many other parts of the world. However, very few prisons or correctional services do anything in relation with it. Except to allow an unofficial death penalty carried on for the prisoners. Chuni Roy (+) did a book on this: Hospital or Prison. Caracas. 1998. We will present a short case history of 3 cases that shocked Colombia and Venezuela, to illustrate what is going on in the XXI century. We carried on psychiatric and sexological treatment and show what we can do despite the fact that we do not have an institutional program and very few resources are allocated to deal with sex offenders. In general we have an incidence of 30% of child sexual abuse, and black data on violations. Only an estimated of 10% are denounced to the police. Arboleda, Lucatelli and Hernandez presented the Declaration of Mar del Plata, but very few people and institutions gave importance to these Rights. World Association for Sexology presented the Declaration of Human Sexual Rights, www.worldsexology.org in 1997 (Valencia, Spain), but we have to do a lot to implement it. Our politicians gave too much importance to laws on violence, especially against the women, but the problem is increasing everywhere. Death penalty is a “solution” in many countries, including developed ones. How to change this? Treatment or Punishment: What a dilemma.

HOMICIDE ATTEMPT, CHRONIC SCHIZOPHRENIA AND IMPUTABILITY: CONTROVERSIAL ASPECTS, CASE ANALYSIS, IN THE CONTEXT OF THE CHILEAN PENAL PROCESS REFORM

INSTITUTIONS
1. Santiago, Chile

AUTHORS
1. E. Sepulveda

A 49-year-old subject, single, orphan, with a history of multiple hospitalizations without the support of treatment, diagnosed with schizophrenia and drug addiction, resident of San Antonio, Region V, attacked a younger subject hurting him with a blade in the abdominal region. Three psychiatrists participated in the process, one from the SML Valparaiso, another from the SML Santiago, and the third for the defense. The psychiatrist for the defense supported the theory that the accused suffered from schizophrenia, and that the aggression was departing from an unmotivated, pursuit delusion, and that therefore the accused was inimputable. The expert from Valparaiso (SML) diagnosed a personality disorder, emphasizing the manipulative capacity of the evaluated, and alleged that the accused’s fundamental problem was drugs and conduct disorders, and therefore their imputability was preserved. The expert from Santiago, diagnosed chronic defective schizophrenia, and considered the crime a motivated act and not a delirious one, so diminished imputability was the consideration that the act responded to a relative incapacity to adjust oneself to a legal and organized, proportioned response to challenges, without a radical alteration of his ability to understand the nature of their conduct, or their consequences. In the sentence, the court sided with the third hypothesis, without giving significant priority to the recommendations on treatment measures and risk prevention provided by the experts, which were so important in this case (social support, continuity of treatment, control of drug consumption, day hospital care).
VIOLENCE RISK ASSESSMENT IN A BRAZILIAN FORENSIC MENTAL HOSPITAL

4. V. Peres Day

Violence Risk Assessment (RA) of forensic mental patients in Brazil used to be carried out on clinical grounds only. Aiming at improving the RA process, the authors evaluate the predictive effectiveness of an objective instrument, the Brazilian version of HCR-20. The sample was composed by 68 male in-patients at Forensic Psychiatric Hospital Dr. Maurício Cardoso (Porto Alegre, RS, Brazil). Sociodemographic variables, as well as HCR-20 and PCL-R scores, were collected on May 2007. PCL-R has already been validated for Brazilian samples. The hospital files were reviewed on a daily basis and all violence and antisocial acts were registered. The end of the observation period is on May 2008.

THERAPEUTIC JUSTICE: A PROGRAM FOR YOUNG OFFENDERS WITH PROBLEMS OF DRUGS USE, ABUSE OR DEPENDENCY IN BRAZIL

INSTITUTIONS
1. Universidade Federal Fluminense, Brazil

AUTHORS
1. J. Werner

"Therapeutic Justice" represents an innovative care modality directed for young offenders with problems of drug use, abuse or dependency, that can effectively contribute to reduce the practical act of infraction and delicts. The data of the National Mapping of the Situation of the Units of Execution of Measure of Privation of Freedom to the Adolescent in Conflict with the Law (in Brazil) serve to reveal the gravity of the problematic of the use of drugs between adolescent infractors: 85.6% used drugs before going for a unit of freedom privation. In this context, Therapeutical Justice pretends to be combination the most adjusted therapeutical boarding with the effective judiciary supervision, demanding, for that judges, prosecutors, defenders, lawyers, forensic child and adolescent psychiatry and others psychosocial professionals are sensitized, especially prepared and compromised with the issue. Therapeutic Justice must provide ample social support to the participant and its family, through the access the set of services and gratuitous and quality actions. Among the changes and truly attitudes expected from the participants, we prioritize those related to lifestyle, particularly the significant decreasing statistics of the following indicators: violent death; behaviour that results in individual or social harm, including offenses; alcoholism and the use of other drugs; HIV infection; sexually transmitted diseases (VD), undesirable pregnancy and school drop-outs. Therapeutic Justice can contribute accomplishing the process of recovery to the measure that makes possible the meeting of the adolescent and the therapist - it materialize, thus, the possibility of restoration of the self-confidence and the hope.

AUTHORS
1. Vladan Starcevic

Symposium of the WPA Section on Measurement Instruments in Psychiatric Care

Objectives:
1) To present the concepts that challenge the prevailing models in psychopathology and may represent an alternative for better understanding of the relationships between various domains of psychopathology.
2) To present how some of these relatively novel concepts can be measured.

A DIAGNOSTIC PROPOSAL FOR MIXED ANXIETY-DEPRESSIVE DISORDERS

INSTITUTIONS
1. Imperial College London, Department of Psychological Medicine, London, United Kingdom

AUTHORS
1. Peter Tyrer

Background: Mixed anxiety-depressive disorders are almost certainly the most common conditions in mental health practice but are not recognized in formal classifications except as sub-syndromal disorders. This is a major omission in nosology.

Aim: To demonstrate the value of a diagnosis of cothymia, a diagnosis of combined anxiety and depressive disorder with equal hierarchy, in formal classifications.

Method: Systematic review of literature.

Results: Preliminary findings suggest that a diagnosis of cothymia is easy to generate using a standard description, can be separated from mild disorders such as sub-syndromal and adjustment disorders at the milder end of the spectrum, and from melancholia, major depressive disorder, panic and agoraphobia at the more severe end, and is associated with a relapsing outcome.

Conclusions: DSM-V and ICD-11 should include this new diagnosis.
A DIMENSIONAL VIEW OF MOOD DISORDERS

INSTITUTIONS
1. University of California I.M.C., San Diego, United States
2. Hecker Psychiatry Research Center, Forli, Italy
3. University of Szeged, Szeged, Hungary
4. National Health Service, Department of Psychiatry, Forli, Italy

AUTHORS
1. Franco Benazzi1,2,3,4

Background: The DSM-IV/ICD-10 bipolar-unipolar splitting of mood disorders, based on polarity of episodes, is questionable. This categorical division was mainly based on differences in age at onset, recurrences, and family history of mania. However, these diagnostic validators do not follow a bi-modal distribution (required for a categorical division) between bipolar and unipolar disorders.

Objective: To present a dimensional conceptualisation of mood disorders.

Results: Bipolar depressions are often mixed (i.e., have concurrent manic/hypomanic symptoms), as are also mania/hypomania. A significant subgroup of unipolar depressions is mixed and close to bipolar disorders on bipolar family history and age at onset. A dose-response relationship exists between the number of co-occurring manic/hypomanic symptoms of mixed depression and bipolar family history loading. The co-occurring manic/hypomanic symptoms do not have a bi-modal distribution between and within bipolar and unipolar depressions. Finally, the co-occurring hypomanic symptoms have a factor structure similar to that of hypomania (apart from elevated mood).

Conclusions: The non-bimodal distribution of diagnostic validators between bipolar and unipolar disorders, and the finding that most episodes of mania/hypomania and depression are mixed, suggest a need for different phenotyping of mood disorders beyond the current polarity approach. Phenotyping mood disorder by recurrences and age at onset has been suggested, also by genetic studies.

DYSPHORIA AS A COMPLEX EMOTIONAL STATE

INSTITUTIONS
1. University of Sydney, Discipline of Psychological Medicine, Sydney, Australia

AUTHORS
1. Vladan Starcevic1

Background: Definitions of dysphoria have been vague, encompassing different emotional states, patterns of thinking and behaviours. Terms “dysphoria” and “dysphoric” are sometimes treated as synonyms for depression, but have been used to denote mood disorders more broadly (e.g., “premenstrual dysphoric disorder”), mixed states of bipolar disorder (e.g., “dysphoric mania”), mixed anxiety-depressive disorder, personality disorders (e.g., “hysteroid dysphoria”), gender identity disorder (“gender dysphoria”), and adverse effects of antipsychotic medications (“neuroleptic dysphoria”). Dysphoria was also believed to be characterised by tension, irritability, hostility, proneness to aggressive acting out and suspiciousness, and was presumed to be important in the development of mood and personality disorders, affective psychoses and even delusional states.

Objective: To present a novel concept of dysphoria.

Results: On the basis of disparate theoretical considerations and empirical findings, an integrative concept of dysphoria has been proposed and dysphoria defined as a complex emotional state, consisting of discontent, sense of defeat, inner tension and irritability, along with frequent manifestations of externalising tendencies (e.g., blaming others) and agitation. An instrument was developed with the aim of assisting in the validation of this concept of dysphoria.

Conclusions: The preliminary results suggest that dysphoria may be a useful concept to describe emotional states encompassing both the internalising (anxiety, depression) and externalising (impulsivity, irritability) aspects of psychopathology. These complex states are not easy to classify and defy categorical approaches to mood, anxiety and personality disorders.

THE CONCEPT OF OBSESSIONALITY AND COMPULSIVITY IN OBSESSIVE-COMPULSIVE DISORDER

INSTITUTIONS
1. University of Amsterdam, Academic Medical Center, Amsterdam, The Netherlands

AUTHORS
1. Damiaan Denys

Background: In the research planning agenda leading up to DSM-V, two topics are being discussed that will influence the way that impulsive and compulsive disorders are perceived. First, there is the idea of removing obsessive-compulsive disorder from the anxiety disorders and creating an obsessive-compulsive behaviours spectrum. Second, there is a proposal to expand the impulse control disorders not otherwise specified, which will be called impulsive-compulsive disorders.

Methods: The presentation offers a phenomenological analysis of the concepts of obsessionality and compulsivity, and reviews their neurobiological underpinnings.

Results: The existence of the group of obsessive-compulsive spectrum disorders, including obsessionality as well as compulsivity, will ultimately be determined by demonstrating a shared endophenotype and underlying pathophysiology.

Conclusion: Changes are proposed to the conceptualisation of obsessionality and compulsivity that might have important implications for the way clinicians recognize and treat obsessive-compulsive disorders.

CIRCULAR CONCEPT OF TIME AND ASSESSMENT OF ABORIGINAL PSYCHOPATHOLOGY

INSTITUTIONS
1. University of Western Australia, School of Psychiatry and Clinical Neurosciences, Perth, Australia

AUTHORS
1. Aleksandar Janca

The Aboriginal concept of time differs from the Judeo-Christian perception of time in that Aboriginal people do not perceive time as an exclusively "linear" category (i.e., past-present-future) and often place events in a "circular" pattern of time. According to this pattern, an individual is in the centre of "time-circles", and events are placed in time according to their relative importance for the individual and his or her respective community (i.e., the more important events are perceived as being "closer in time"). Such an important difference in the perception of time contributes to the limited applicability of currently used diagnostic and assessment procedures in psychiatry and creates numerous difficulties in providing culturally appropriate mental health services to Aboriginal people in Australia.

This presentation will review methods and results of an ongoing project, which aims to develop novel and culturally appropriate screening and assessment tools suitable for the assessment of psychopathological phenomena in Aboriginal people.

FIGHTING STIGMA AND DISCRIMINATION: VIEWS FROM GERMANY, CANADA, AND JAPAN

INSTITUTIONS
1. World Psychiatric Association, Canada

AUTHORS
1. Stigma and Mental Disorders Scientific Section

Stigma and discrimination because of mental disorders are attracting increasing public health attention. Many countries have launched anti-stigma efforts and research into factors that predict and deter stigma is increasing. This symposium, offered on behalf of the Stigma and Mental Disorders Section, will examine nationally oriented anti-stigma efforts from the perspective of three countries in different stages of program development with three different approaches that have been influenced by different cultural realities and national contexts. The objective of this session is to foster reflection and discussion about the practical aspects of stigma reduction efforts, ranging from implementation to evaluation. A senior member of WPAs Global Anti-stigma program will act as the discussant to place the main challenges experienced by these countries in the context of the knowledge base gained from the WPAs Global program.

TACKLING THE STIGMA OF MENTAL ILLNESS: THE GERMAN ALLIANCE FOR MENTAL HEALTH

3. Harold Zaske

In the year 2000, one year after the XI. WPA World Congress in Hamburg, a society was set up to implement the WPA Global Antistigma Programme "Open the Doors" in Germany. Initially, seven local antistigma projects were founded which organized interventions to reduce the stigma of mental illness. In cooperation with service users, target groups (e.g., the general public, school children, police officers) were addressed with specific interventions. Some of the interventions were evaluated, yielding positive feedbacks from the target audiences. Furthermore, two representative telephone surveys were conducted in the years 2001 and 2004 to evaluate the programme's effect on national level. The results showed a small but significant reduction of stigmatizing attitudes in the general population which could partially be ascribed to the work of the antistigma initiatives. These positive results supported the idea to form a national federation where different social organizations could bundle their common efforts to reduce the stigma of mental illness. For this purpose, the German Alliance for Mental Health was founded in 2004 by the German Open the Doors Society and the German Society for Psychiatry, Psychotherapy and Nervous Diseases, in cooperation with the German Federal Health Ministry. In the meantime, more than 30 organizations, associations and initiatives have joined the alliance. In autumn 2007, a startup congress "Education - Prevention - Integration" was organized with special focus on the topics "Mental Health and Work", "Mental Health in the Youth", "Antistigma Research and Practice", and "Prevention and Early Recognition".
A NEW AWAKENING: FIGHTING STIGMA AND DISCRIMINATION IN CANADA

INSTITUTIONS
1. Queen's University, Canada

AUTHORS
1. Heather Stuart¹, Professor, PhD, heather.stuart@queensu.ca

Although it has been over ten years since Canadians piloted the World Psychiatric Associations Global Program to Fight Stigma because of schizophrenia, Canadian policy makers are only now recognizing the importance of national anti-stigma efforts. This comes as a result of recommendations made by a Senate appointed committee to examine the state of the mental health system in Canada. The Senate Committee was the first parliamentary interest displayed in mental health since a Royal Commission investigated the state of mental hospitals in Canada in the early 1950’s. While Canadians pride themselves on their universally accessible health care system, results from the Senate Committee’s work highlighted the scope of the unmet need for mental health care and the many structural and attitudinal barriers that impeded mental health reform.

ANTI-STIGMA APPROACH TO THE YOUTH: DEVELOPMENT OF SCHOOL-BASED EDUCATIONAL PROGRAM IN JAPAN

4. Mitsumoto Sato⁴, Dr.

Japan has taken various avenues for anti-stigma efforts of people with mental illness along with the WPA global program. One such effort includes the change of the Japanese term for “schizophrenia” in 2002. Many people with schizophrenia experience their onset in their teens when there is limited opportunity to obtain information on the illness and open a discussion regarding living together with those with mental illness in Japanese junior or high-school curriculum. With these facts in mind, we developed an educational program for junior- and high-school students to increase knowledge and improve attitudes toward people with mental illness, particularly schizophrenia. This presentation will describe development of an educational program for students in junior and high school in Japan. A DVD containing a first account of a person with mental illness and an animated explanation of the scientific facts of schizophrenia by a mental health professional was used in the context of an educational program to deliver three messages: 1) anyone can have the mental illness, 2) mental illness is treatable, 3) people with mental illness can recover and reintegrate into age-appropriate social and occupational roles. The program was piloted in several schools in Japan and evaluated using a pre/posttest design. Fostering de-stigmatizing attitudes toward mental illness is essential in this time of preventive early intervention and recovery-oriented movements. Results showed that school-based educational program is feasible even in the absence of ministerial teaching curriculum guidelines in Japan.
THE SCOPE AND BURDEN OF STIGMA: IMPLICATIONS FOR CHANGE

INSTITUTIONS
1. World Psychiatric Association, Canada

AUTHORS
1. Stigma and Mental Disorders Scientific Section

This symposium, offered on behalf of the Stigma and Mental Disorders Scientific Section will review stigma and discrimination experienced by family members and examine the role played by medical professionals (specifically medical students) in the creation and maintenance of stigma and as an important target for stigma reduction efforts. A senior member of WPA’s Global Anti-stigma program will act as the discussant to examine the implications of these presentations for future stigma reduction and management strategies.

EXperienced stigma AND THE EFFECTIVENESS OF STIGMA COPING ORIENTATIONS: COMBINING QUALITATIVE AND QUANTITATIVE FINDINGS

INSTITUTIONS
1. University of Zurich, Switzerland

AUTHORS
1. Beate Schulze
2. Martina Scherrer
3. Mayo Janeiro
4. Helena Kiss

Objective: Research on mental health-related stigma has been criticized for excluding the views of those exposed to stigmatising reactions. This changed with the advent of qualitative stigma research. However, population-based data on the prevalence, severity and consequences of users’ stigma experiences is still lacking.

Methods: Using the German version of the Inventory of Stigmatising Experiences (ISE), a survey was carried out among people with schizophrenia (n=50), borderline personality disorder (n=50) and affective disorders (n=20) in Switzerland. The instrument was developed by Stuart et al. (2005), aiming to facilitate the collection of epidemiological data on experienced stigma. The ISE is a semi-structured questionnaire that measures three constructs: (1) the scope of stigma experienced in different life domains, (2) stigma coping reactions, (3) and stigma’s psychosocial impact. Coping strategies were assessed with 3 items reflecting Link et al’s (1991) basic stigma coping orientations: secrecy, withdrawal/avoidance, and education, as well as through qualitative analysis of verbatim field notes.

Results: Field-testing of the German version of the ISE showed good reliabilities for the stigma experiences (SES) and stigma impact (SIS) scales (Cronbach’s α = .74 and .86, respectively). An average of 54% of Swiss service users report stigma experiences across the SES. Most stigma experiences are recent and thus susceptible for interventions. Stigma coping orientations, including those commonly held to be “negative coping”,
PREDICTORS OF CAREGIVERS' BURDEN AND QUALITY OF LIFE IN FAMILIES OF PATIENTS WITH SCHIZOPHRENIA IN THE REPUBLIC OF BELARUS

INSTITUTIONS
1. Belarusian Medical Academy, Belarus

AUTHORS
1. Kate Mironova 1, Dr.

Purpose: The study was carried out at the Department of Psychiatry and Narcology of the Belarusian Medical Academy of Post-Graduate Education. The purpose was to define predictors of caregivers’ burden and quality of life in families of patients suffering from schizophrenia.

Method: Study participants were 102 caregivers of patients with schizophrenia admitted to the Republican Clinical Psychiatric Hospital. Measures included: the Medical Outcomes Study Short-Form 36 (SF-36) survey; Family Experiences with the Stigma of Mental Illness Questionnaire, the Coping Strategies Questionnaire; the Questionnaire of Family Burden according to the WHO «Quality Assurance in Mental Health Care».

Results: We estimated burden, quality of life, stigma and coping-strategies of family members caring for a relative with schizophrenia. We defined three groups of caregiver’s burden predictors. First, factors associated with socio-demographic characteristics of caregivers (gender, age, family relationship, education, level of income). Second, patient factors (diagnosis, gender, duration of mental illness, aggressive behaviour). Third, caregiver factors (high expectation of stigma, experienced stigma by association, inadequate coping-strategies, lack of knowledge about psychiatric disorders).

Conclusion: This study underlines the importance of assessing specific family needs in caring for a relative with schizophrenia. Understanding factors associated with caregiver’s burden and QoL can help health professionals to develop the psychosocial intervention for caregivers of patients with schizophrenia. Having influenced the factors connected with stigma mental illness, we’ll be able to improve the QoL and satisfactions of caregivers’ lives.

SCHIZOPHRENIA AND STIGMA AMONG MEDICAL STUDENTS -- A PROPOSAL FOR CHANGE

INSTITUTIONS
1. Sao Paulo Federal University, Brazil

AUTHORS
1. Thiago Marques Fidalgo 1, Dr.
2. Cecilia Villares 1, Dr.
3. Miguel Jorge 1, Dr.

Stigma related to patients diagnosed with schizophrenia is an important public health issue. All the social limitations that it carries are related to prejudice and lack of knowledge. Even more relevant is the fact that among health professionals a stigmatizing behavior is the rule. This problem can be better faced if interventions are made still during undergrad courses. This paper presents an educational initiative for changing this attitude developed at São Paulo Medical School - Federal University of São Paulo.

Since July 2006 the Schizophrenia Program of the university (PR-ESQ) and the Brazilian Anti-Stigma Project (S.O.esq.) coordinate an elective discipline named "Schizophrenia: Widening Concepts". The program of the discipline includes discussions about historical, epidemiological and clinical aspects of the disease. A medical approach is presented to the Medical School students. On the following classes, new ideas are introduced and discussed. The importance of the multiprofessional team and the need of a holistic view of the patient are the focus on this second part. Finally, a patient presents his own experience with the disease, from the first impact of being diagnosed to the strategies of coping with prejudice, and striving for recovery.

With this presentation, we aim to clarify the importance of a professional attitude free of prejudice. This can result in benefits not only for patients with schizophrenia, but also for all patients with mental disorders.

TRANSITION AND MENTAL HEALTH PROBLEMS FOR PWID

INSTITUTIONS
1. WPA Section Psychiatry of Mental Retardation/ Intellectual Disability, Italy

AUTHORS
1. Marco Bertelli

Transition experiences are much more difficult for people with intellectual disabilities than for the general population and are often related to the development of mental health problems. After a brief review of the issues and policies over the past 30 years that have affected the development of services, the symposium offers some guidelines for better assessment and support.

YOUNG PEOPLE WITH INTELLECTUAL DISABILITY & MENTAL HEALTH PROBLEMS IN TRANSITION: A UK PERSPECTIVE

INSTITUTIONS
1. Kings College London Institute of Psychiatry, Estia Centre, Marmo-Gays Hospital, London, United Kingdom

AUTHORS
1. Jane McCarthy, Dr., MD, jane.m.mccarthy@kcl.ac.uk

Aims: To review the evidence base on the needs of young people with intellectual disability and mental health problems in transition.

Method:
A brief introduction of the issues and policies over the past 30 years that have affected the development of services for young people with intellectual disability in United Kingdom will be outlined. The mental health care needs of young people with intellectual disability in transition will be presented including the evidence base for interventions.

Results: The types of models of services that have developed across England will be discussed with a description of a Specialist Team for Young People given as an example of one model. Case examples will be described of young people with mental health problems in transition.

Conclusion: To summarise the principles of good practice with reference to national guidelines for United Kingdom.
GUIDELINES FOR TRANSITION SERVICES FOR YOUNG PEOPLE WITH INTELLECTUAL DISABILITIES

INSTITUTIONS
1. University of Birmingham, Division of Neuroscience, Department of Psychiatry, Birmingham, United Kingdom
2. Queen Elizabeth Psychiatric Hospital, Birmingham, United Kingdom

AUTHORS
1. Shoumitro Deb1,2, Prof., MD, s.deb@bham.ac.uk
2. Gemma L. Unwin1,2, Miss, g.l.unwin@bham.ac.uk

Aims: To develop an evidence and consensus based national guide in the UK for services involved in the transition of young people with intellectual disabilities (ID) and mental health problems and challenging behaviours.

Methods: A guideline development group (GDG) comprising individuals from a wide range of relevant backgrounds (including carer and person with ID) developed the recommendations. The GDG considered evidence from a comprehensive research programme including systematic reviews, focus group interviews and stakeholder consultations.

Results: Three guides were produced including a quick reference guide and an accessible version. Some important recommendations are: a) persons with ID and their carers should be at the centre of the transition planning process, b) the adult services should lead the transition planning process long before the person with ID reaches adulthood, c) people with ID and their carers should be empowered by providing them appropriate information, in an appropriate way at the right time, d) it is essential to collect good quality population-based data for forward planning, e) provide continuity of care by providing a key professional contact throughout the transition process, and f) encourage common understanding of planning processes among different agencies.

Conclusion: Young people with ID and their carers face complex problems during transition. Those with additional mental health needs require substantial support to achieve good quality of life. However, they are often poorly served by a lack of effective multi-agency service planning. The guideline provides advice to professionals with the aim to improving the transition experience of this group.

LIFE EXPERIENCES AND ADDITIONAL TRANSITION IN ID: AN ITALIAN SURVEY

INSTITUTIONS
1. Italian Society for the Study of Mental Retardation, Firenze, Italy
2. AMG della Misericordia di Firenze, CREA (Centro di Ricerca ed Evoluzione AMG), Firenze, Italy
3. IRCCS San Giovanni di Dio Fatebenefratelli, Brescia, Italy

AUTHORS
1. Marco Bertelli1,2, Dr., MD, bertelli.fi@tiscali.it
2. Giampaolo La Malfa1, Dr., MD, gplamalfa@videosoft.it
3. Giovanni Giambalvo Dal Ben2, Dr., MD, giambalvo@tin.it
4. Sergio Monchieri3, Dr., MD, smonchieri@fatebenefratelli.it

OBJECTIVE: Though the applications of new European and national directives are bringing some improvements, Italian people with ID are still experiencing a lot of external difficulties in transition phases and stages of life. Most of the inclusion, support and care interventions they receive actually remain fragmented and based upon a concept of normalisation. The application of individualised life-span managements founded on a quality of life approach, which could bring better outcomes, seems to be far to be realised.

METHODS AND RESULTS: First results of an Italian survey programme (ISTORIA) for the study of the relationship between social-environmental variables throughout the life-span, life-events and mental health outcomes confirm that individuals with ID have experience of transition qualitatively quite different from that experienced by other people of the general population, they are also more likely to be subject to adverse life experiences and more likely to undergo to additional transitions due to frequent co-existence of psychiatric or other medical conditions.
SECTION SYMPOSIA

PSYCHOANALYSIS (AND PSYCHODYNAMIC PSYCHIATRY) AND RELIGION AND SPIRITUALITY: PERSONHOOD AND PERSONALITY DISORDERS

INSTITUTIONS
1. Meerkanten GGZ, Outpatient Clinic, Harderwijk, The Netherlands

AUTHORS
1. Peter J. Verhagen, mr., MD, verhagen.p@wxs.nl

This Section Symposium informs the attendees about the recent developments and current state of affairs with regard to religion and spirituality from a psychoanalytic and psychodynamic psychiatric point of view. The contributors will focus on personality and personality disorders.

Objective
Attendees will better recognize the importance of a comprehensive and integrated view.

THE SCIENCE AND SPIRITUALITY OF WELL-BEING

INSTITUTIONS
1. Washington University, Biology & Biomedical Sciences, St. Louis, United States

AUTHORS
1. Robert Cloninger, dr., MD, PhD, clon@wustl.edu

Psychosocial, biomedical, and spiritual approaches to well-being can now be fully integrated based on a comprehensive model of the psychobiology of well-being. In Feeling Good: The Science of Well-Being (Oxford 2004) Cloninger has presented a holistic approach to understanding health and disease. Every patient can be assessed systematically in terms of a moderate number of variables (three dimensions of character and four dimensions of temperament), each with a distinct psychology, biology, and sociology. In addition, the assessment of psychopathology requires assessment of other variables related to a person’s worldview, serenity, and self-esteem. Well-being only arises when a person learns how to let go of struggles, to work in the service of others, and to grow in self-awareness. As a result, it is important to consider the narrative of a person’s life in helping people to develop well-being. This requires reflection on one’s outlook on life, which can be viewed as a spiritual process or as a way of broadening and expanding the use of all of a person’s intelligences. A psychoeducational program for well-being has been developed, called Voyages to Well-Being (see http://tci.wustl.edu).

Objectives
Attendees will be able: - to describe the personality of themselves and others in terms of the seven dimensions of the Temperament and Character Inventory (TCI) - to use the TCI in diagnosis and treatment planning Attendees will better recognize:
- what practices lead to life satisfaction and happiness, and which lead to vulnerability to distress and mental disorder.
- how genetic and environmental variables influence thought and the development of personality.
PSYCHOANALYSIS, RELIGION, AND SPIRITUALITY

INSTITUTIONS
1. University of Louisville, Department of Psychiatry and Behavioral Sciences, Louisville, United States

AUTHORS
1. Alan Tasman, Dr., MD, PhD, alan.tasman@louisville.edu

Since Sigmund Freud’s first publication on religion and religious practices a century ago, the role and meaning of religious practice and experience for individuals and group has been an ongoing area of enquiry within psychoanalysis. Major contributions have been made to the theorizing about the psychological meaning of religiosity and spirituality as a cultural phenomenon and as a personal experience. While at times the psychoanalytic approach has emphasized pathological mechanisms of religious practice and experience, there has evolved a rich body of work in this area. In addition, there have been contributions from psychoanalysis in relation to various religious traditions, for instance Buddhism and other eastern philosophies. Vital questions include: How do religious stories carry or distort psychological truth? How do religion and spirituality play a role in developing and mature mental functioning? What is the nature of religious and spiritual experience?

In this presentation an overview will be giving of historical developments and the current state of affairs with regard to religion, spirituality and personhood, both about psychotherapy as clinical practice, and also concerning training of psychotherapists.

SELF AND RELATEDNESS: A TAKE ON A FUNDAMENTAL ISSUE AT THE INTERFACE OF RELIGION AND PSYCHIATRY

INSTITUTIONS
1. Meerkanten GGZ, Outpatient Clinic, Harderwijk, The Netherlands

AUTHORS
1. Peter J. Verhagen, Mr., MD, verhagen.p@wxs.nl

Belief systems, religious and spiritual convictions and practices belong to the functions, roles, attitudes and inclinations of a person. Accordingly, religion and spirituality may be investigated in relation to mental health, for a person uses these functions and roles as he uses his religious and spiritual convictions. What can be used can also be pathologically misused, as in the case of religious and spiritual belief systems in relation to personality disorders. According to this approach, religiousness and spirituality can, if necessary, be treated. Does this instrumental approach really work? How do we conceptualize personality and personality disorder? How might religious and spiritual traditions help our understanding as clinicians?

Objective
Attendees should have a better understanding of the concepts of self and relatedness in relation to various religious and spiritual traditions.

THE INFLUENCE OF ECOLOGICAL CHANGES ON MENTAL HEALTH

INSTITUTIONS
1. Catholic University Medical School, Psychiatry, Rome, Italy

AUTHORS
1. Luigi Janiri

Ecological changes in the world include physical environment modifications due to natural or technological factors. These changes may influence the people’s mental health by inducing either the onset of new disorders or the worsening of pre-existing disorders. The effects of ecological changes may vary from country to country depending on the social and cultural framework.

GLOBAL CLIMATE CHANGE: HEALTH AND MENTAL HEALTH CONSEQUENCES

INSTITUTIONS
1. The George Washington University, School of Medicine and School of Public Health, Washington, D.C., United States

AUTHORS
1. Eliot Sorel

Human life has been increasingly affected by the drastic climactic conditions on our planet. Several indices reflect this dramatic shift illustrated by the fact that 1998 was the warmest year and the 1990s were the warmest decade on record as recorded until the year 2000. These record temperatures have not abated.

Vast areas of our planet are experiencing flooding rainfalls alternating with intense and increased droughts in other areas, the latter particularly in Asia and Africa. Additionally, global emissions of carbon dioxide are likely to increase surface temperature by 1.4–5.8 °C. The projected rate of warming is anticipated to be greater than anything experienced in the past 10,000 years with accompanying hurricanes, tsunamis, cyclones, floods with tens of millions affected.

Recent episodes of fatal consequences of such changes include the 10,000 deaths and 10–15 millions affected as a result of the cyclone in Orissa, India in 1999; 30,000 deaths in and around Caracas, Venezuela following floods, in December 1999; more than 27,000 deaths in Europe in the summer of 2003 as a result of very high temperatures; hundreds of thousands affected by hurricane Katrina in the Gulf States of the United States in the summer of 2005.

The author presents health and mental health consequences of global climate change.

ECOLOGY AND MENTAL HEALTH IN THE EASTERN MEDITERRANEAN REGION

INSTITUTIONS
1. Ain Shams University, Institute of Psychiatry, Cairo, Egypt

AUTHORS
1. Tarek Okasha

The Eastern Mediterranean Region (EMRO) of the WHO is composed of 22 countries; all of them speak Arabic except for Iran, Pakistan and Afghanistan although they write in Arabic.

The most volatile region in the world at the moment is the EMRO region, just look at the eternal conflict between Palestine and Israel and the blood shed everyday.

The ecological disaster in Gaza and its consequences on health and mental health in particular. In Iraq; a disaster; where at least 3 million people have been displaced internally and externally due to the occupation, apart from the nearly one million killed and injured during the war. In Darfur there is famine, displacement, housing problems and nutritional problems, what are the mental health consequences of such a problem? Recently, we are hearing about the rising problems in Pakistan and the long lasting problems in Afghanistan over many years.

This presentation will shed light on how the ecological changes have affected mental health in the region as well as the mental health services.

ECOLOGY, MENTAL HEALTH AND RURAL LIFE

INSTITUTIONS
1. St. John of God Richmond Hospital, North Richmond, Australia

AUTHORS
1. Sadanand Rajkumar

Several demographic processes shape the population of rural areas the world over. Fertility, mortality, morbidity, and internal migration factors affect overall quality of life. A major rural transition is taking place due to global climate changes and ecological factors, such as drought; floods and other natural disasters change the very fabric of social life in rural regions.

This presentation highlights the structure and processes within rural areas that impinge on life. Main issues discussed are:
1. Changing age structure, the pattern and level of service needs in the rural areas.
2. Issues relating to indigenous people.
3. Changes within the family structure of diverse remotely based people.
4. Special populations such as Farmers and Farming families.
5. Access to mental health care.
6. Newer models of care in remote areas.

Mental health problems in Farmers impose a significant burden of illness on the community, in particular Depression; suicide and Health related behavioural problems.

Conclusion:
Mental Health is clearly dependent on the socio-cultural milieu. Access and availability of appropriate services must incorporate management of ecological issues, while planning contingencies developing newer models of care.
METEOROPATHY AND METEOROSENSIBILITY IN AFFECTIVE AND ANXIETY DISORDERS

INSTITUTIONS
1. Catholic University Medical School, Department of Psychiatry, Rome, Italy

AUTHORS
1. Marianna Mazza
2. Marco Di Nicola
3. Luigi Janiri

Introduction: The term ‘meteoropathy’ indicates every pathological dimension in some way related to weather conditions. Meteorosensitive are those subjects biologically susceptible to feel the effects of particular atmospheric events, whereas meteoropathics develop a specific illness or a worsening of an existing disease as a consequence of these climatic changes.

Methods: 100 patients with affective and 50 with anxiety disorders were administered a recently formulated questionnaire, the Q-METEO, in order to assess their sensitivity to climate changes. The tool also includes a structured checklist to identify physical and psychological symptoms mainly related to climate variations. All patients were also administered the Temperament and Character Inventory-Revised to evaluate the personality profile. A control group of 100 non-clinical subjects was also evaluated.

Results: Preliminary results have shown a greater presence in the experimental groups of meteorosensitivity and meteoropathy traits compared with the control group. Correlations were found with the phase of disease and temperamental and character traits.

Conclusions: Recently, the hypothesis of a possible interaction between the periodic variations of climatic-environmental factors and the biological systems underlying a variety of disturbances has been developed. This study supports the evidence that physical environmental stimuli may play a role in the pathogenic mechanisms underlying affective and anxiety disorders.

HOT TOPICS IN PHARMACOPSYCHIATRY

INSTITUTIONS
1. University Hospital Munich, Department of Psychiatry, Munich, Germany
2. Rikshospitalet University Hospital, Department of Neuropsychiatry and Psychosomatic Medicine, Oslo, Norway

AUTHORS
1. Hans-Jürgen Möller, Dr., MD, hans-juergen.moeller@med.uni-muenchen.de
2. Ulrik F. Malt, Dr., MD, u.f.malt@medisin.uio.no

Hot topics will be presented in an evidence based state of the art approach. These topics are of high current interest, because either the drug treatment in the respective indication is not well accepted or it is difficult to make the right selection of a drug in the respective indication.
DEPRESSION AND SUICIDALITY: THE BENEFICIAL BUT ALSO POSSIBLY HARMFUL EFFECT OF ANTIDEPRESSANTS

INSTITUTIONS
1. University Hospital Munich, Department of Psychiatry, Munich, Germany

AUTHORS
1. Hans-Jürgen Möller, Dr., hans-juergen.moeller@med.uni-muenchen.de

Several methodological limitations make it difficult to investigate in randomised, controlled studies whether antidepressants increase or decrease suicidality. Different kinds of studies (epidemiological, quasi-experimental interventions, naturalistic follow-ups, etc.) should therefore also be considered in order to obtain the most comprehensive evidence. Taken together, these different approaches supply reasonable evidence that antidepressants are able to reduce both suicidal ideation and suicide in depressive patients.

In the past few years several papers have reported critically about the risk of suicidal thoughts and behaviour associated with antidepressant treatment, primarily SSris. The risk-benefit ratio of AD treatment was questioned, especially in children and adolescents. The critical publications led to warnings being issued by various regulatory authorities such as the FDA, MHRA and EMEA and stimulated new research activities in this field.

Based on a very comprehensive review of all available data it can be summarised that ADs in general, not only SSRIs, have a very low risk of inducing suicidal thoughts and even suicide attempts, especially in age groups below 25. This risk evens out at the age of about 30-40.

In individual decision-making this risk has to be balanced against the well-known beneficial effects of ADs on depressive and other symptoms (anxiety, panic, obsessive-compulsive symptoms) and on suicidality and suicidal behaviour. Decision-making according to the principles of good clinical practice should consider carefully the beneficial effects of AD treatment as well as potentially harmful effects and thus keep the potential risks of AD treatment at a minimum. Especially the lower lethal toxicity profile of most modern antidepressants seems advantageous in cases with severe suicidality where the choice of a less toxic antidepressant helps to avoid the risk of fatality if the patient should misuse the antidepressant for a suicide attempt.

Psychosomatic disorders include somatization disorder, hypochondria, body dysmorphic disorder, somatic complaints and illness behaviour secondary to psychophysiological activation (e.g. irritable bowel syndrome), conversion disorders (e.g. psychogenic non-epileptic seizures) and biomedical unexplained somatic syndromes (e.g. fibromyalgia). A wider concept includes biomedical diseases assumed to be provoked or sustained by psychological factors (e.g. ulcerative colitis) and psychiatric aspects of somatic diseases (e.g. depression and cardiovascular disorders). Psychological interventions have proven efficacy in most psychosomatic disorders. However, the effect sizes are often moderate and drug-psychotherapy studies suggest that psychopharmacological interventions sometimes may achieve results similar to that of psychotherapy and in some cases drug treatment may be crucial for obtaining good functional outcome.

This paper will review the current empirical evidence of the efficacy of psychopharmacological treatment of psychosomatic disorders and identify some key issues for successful drug treatment of psychosomatic disorders. This includes identifying and treating psychosomatic manifestations of some major psychiatric disorders (e.g. bipolar II disorders, panic disorder, borderline personality disorder). In cases where such disorders have been ruled out, psychopharmacological treatment should be individually tailored based on the patient’s symptomatology, personality traits and knowledge about receptor profiles of the different drugs available. The choice of drug should also be beneficial for any concurrent somatic diseases if present. The presentation will include clinical examples to demonstrate the treatment principles.

PHARMACOLOGICAL INTERVENTION IN ACUTE STRESS REACTION: THE GOOD, THE BAD, AND THE UGLY

INSTITUTIONS
1. Chaim Sheba Medical Centre, Department of Psychiatry, Tel Hashomer, Israel

AUTHORS
1. Joseph Zohar^1, Dr., MD, Jzohar@post.tau.ac.il

Acute stress reaction (ASR), the initial response to trauma, is considered normal in the first days. Posttraumatic stress disorder (PTSD) is diagnosed when this response continues for at least a month (only about 20% of cases). PTSD could therefore be seen as a ‘failure to recover’.

This conceptualization has therapeutic ramifications; in the first days (and weeks) after exposure, the focus of treatment would be on how not to interfere with the recovery process. The challenge is to verify if and what type of early intervention during this “window of opportunity” is effective for those at a high risk of developing PTSD.

In the past, benzodiazepines (BZ) were administered to ASR patients, yet research failed to show a significant benefit for this treatment, and some studies noted a worse outcome in these cases.

Plasticity of the HPA axis has been found critical for recovery in an animal model of PTSD, suggesting cortisol as a potential early intervention. An animal model of PTSD has also been used to examine the possibility of erasing traumatic memories, using anisomycin, a protein synthesis inhibitor, which interferes with the consolidation of memory. Indeed, this intervention was successful in reducing PTSD-like symptoms in rats exposed to trauma.

A large prevention study, in which SSRI (in this case, escitalopram) administration is not postponed until there are full-blown PTSD symptoms, but is administered right after the exposure, is currently underway.

COGNITIVE ENHANCEMENT IN SCHIZOPHRENIA WITH PHARMACOLOGICAL INTERVENTIONS

INSTITUTIONS
1. Clinical Neuroscience Research Centre, Department of Psychiatry, Dartford, Kent, United Kingdom

AUTHORS
1. Tonmoy Sharma^1, Dr., MD, tonmoy.sharma@cognitiongroup.com

Cognitive impairment is a central feature of schizophrenia. Most patients have a poor functional outcome, including deficits in social, occupational, and self-care activities. Functional deficits in schizophrenia are most strongly predicted by the current severity of cognitive impairment, followed by the severity of negative symptoms. Severity of positive symptoms is not strongly associated with the level of functional impairments, even in those with very poor outcome schizophrenia. There is thus an urgent need to find strategies for improving cognitive functioning in schizophrenia. It is widely felt by clinicians that conventional antipsychotic drugs have potent therapeutic actions on psychotic positive symptoms, but relatively weak actions on negative or cognitive symptoms. Currently marketed atypical antipsychotics seem to have limited beneficial effects on cognitive function. Facilitation of central cholinergic activity may form another potential treatment strategy for cognitive impairment in this population, since lesion and pharmacological studies in experimental animals and pharmacological probe studies in normal volunteers have repeatedly demonstrated a relationship between central cholinergic activity and cognitive functions, such as learning, memory and attention.

However, the effects of cognitive enhancers that are licensed for Alzheimer's disease have had limited efficacy in treating the cognitive deficits in schizophrenia. This presentation will outline the new strategies that are being followed to assess cognitive enhancement in schizophrenia and will review the results of recent clinical and brain imaging studies in this area along with regulatory guidance about drug development for cognitive enhancement in schizophrenia.
WORLD PSYCHIATRIC ASSOCIATION
PHARMACOPSYCHIATRY SECTION STATEMENT ON
COMPARATIVE EFFECTIVENESS OF ANTIPSYCHOTICS IN
THE TREATMENT OF SCHIZOPHRENIA

INSTITUTIONS

2. Hans-Jürgen Möller, Dr, MD, hans-juergen.moeller@med.uni-muenchen.de

The World Psychiatry Association Section on Pharmacopsychiatry developed this comprehensive update on the comparative effectiveness of different antipsychotic treatments for schizophrenia. Utilizing data from the approximately 1,600 randomized controlled trials of antipsychotic treatment in schizophrenia, we compared the effectiveness currently-available antipsychotic agents. Although subclasses of first-generation and second-generation antipsychotics were both found to be very heterogeneous, second-generation antipsychotic agents were inconsistently more effective in alleviating negative, cognitive, and depressive symptoms with a lower liability for tardive dyskinesia. These modest benefits were principally driven by the ability of second-generation antipsychotics to provide equivalent improvement in positive symptoms with a lower risk of causing extrapyramidal side-effects. Clozapine was more efficacious than other agents in treatment-refractory schizophrenia. There were no consistent differences in efficacy among other second-generation antipsychotic agents; if such differences exist, they are likely small in magnitude. Dosing is a key variable in optimizing effectiveness of both first- and second-generation antipsychotic agents.

There was enormous individual variability in antipsychotic response and vulnerability to various adverse effects. In contrast to their otherwise relatively similar efficacy in treating positive symptoms, there are substantial differences among both first- and second-generation antipsychotic agents with regard to their propensity to cause metabolic and other adverse effects. Based on these data about the comparative effectiveness of different antipsychotic treatment options, we summarized elements of current best antipsychotic practice for the treatment of schizophrenia and discussed the role of government and the pharmaceutical industry in obtaining and disseminating information which can facilitate best practice.

Cross-sectional symposium by section of Intellectual Disabilities (L. Salvador-Carulla) and section of classification (I Salloum)

Background: The classification of Intellectual Disabilities (ID) is similar in ICD and DSM and it remains unchanged since the 1980s. However, the three criteria used in both systems (IQ below 70, impairment in adaptive skills and age of onset below 18 years of age) do not fit current knowledge and developments in this field. In addition to that, the classification of psychiatric disorders in DSM-ICD systems may require specific adaptation to ID. A special focus should be provided on ID both in DSM-V and in ICD-10. A number of national and international organisations have contributed to the improvement of nomenclature and the classification of ID. Aim: to introduce and to update the international classification systems of Intellectual Disabilities and related psychiatric disorders in order to explore links, consensus across different systems, and usefulness in research and clinical practice. Key experts from the main international organisations in this area have been invited to participate.

THE CLASSIFICATION OF INTELLECTUAL DISABILITIES OF AAIDD: AN UPDATE

INSTITUTIONS
1. University of New Mexico, Special Education, Albuquerque, United States

AUTHORS
1. Ruth Luckasson1, Mrs, JD, ruthL@unm.edu

The American Association on Individuals with Intellectual and Developmental Disabilities (AAIDD) has promulgated definitions of intellectual disability (previously mental retardation) since 1921. The 10th edition of the definition manual, Mental Retardation: Definition, Classification, and Systems of Supports (2002), provides one of the most widely used definitions in the US and internationally.

As chair of the AAIDD Terminology and Classification Committee for both the 1992 and 2002 editions, I will explain the AAIDD definition and the five assumptions essential to the definition, show the theoretical framework that underlies it, present the unique classification system based on intensity of needs for supports (rather than the IQ-based previous system of mild, moderate, severe and profound), and participate in comparisons to other international definitions. This presentation is part of a panel in which the various international definitions are explained and the group explores areas of consensus.

ICD AND INTELLECTUAL DISABILITY

INSTITUTIONS
1. Institute of Psychiatry, Child Psychiatry, London, United Kingdom
2. Lancaster University, Institute for Health Research, Lancaster, United Kingdom

AUTHORS
1. Emily Simonoff1, Dr, MD, e.simonoff@iop.kcl.ac.uk
2. Eric Emerson2, Mr, PhD, eric.emerson@lancaster.ac.uk

This presentation will address two issues. First it will consider the current approach to defining intellectual disability in ICD in light of the continuing development of the ICF evidence of the relationship between cognitive functioning in childhood and psychopathology. These considerations will raise questions about: (1) the continuing role of adaptive behaviour as a component of the formal definition of intellectual disability in ICD; and (2) the current use of IQ<70 to define intellectual disability. Second, it will explore the evidence for maintaining the same classification system and diagnostic criteria for Axis One across the IQ range. Specific attention will be given to differences in symptom patterns and associations between psychiatric disorder and psychosocial impairment in those with and without intellectual disability.
DIAGNOSTIC MANUAL - INTELLECTUAL DISABILITY (DMM-ID): A TEXTBOOK OF DIAGNOSIS IN PERSONS WITH INTELLECTUAL DISABILITY

INSTITUTIONS
1. National Association for the Dually Diagnosed, Kingston, NY, United States
2. University of Ottawa, Department of Psychiatry, Ottawa, Canada

AUTHORS
1. Robert J. Fletcher¹, Dr., rfletcher@thenadd.org
2. Chrissoula Stavrakaki², Dr., MD, Ph.D.

This presentation will describe the key components of the DMM-ID, which has been published by NADD in association with the APA. The presentation will include the rationale for development of the DMM-ID, the major categories included in each chapter, and how the DMM-ID can be of clinical value in conducting an assessment and making a diagnosis in persons who have Intellectual Disabilities. All major diagnostic categories of mental disorders, as defined in the DSM-IV-TR, are covered in the DMM-ID. The DMM-ID does not follow the arrangement of mental disorders, as mentioned in the DSM-IV-TR for Obsessive Compulsive Disorders and Post Traumatic Stress Disorders. It was felt important that these two entities be discussed separately from the Anxiety Disorders, as they are frequently under-diagnosed in persons with Intellectual Disabilities. Chapter guidelines have been developed to allow for clarity and uniformity. An expert consensus model was employed, whereupon each chapter grew. An evidence-based approach was also employed for evaluation of diagnostic and treatment practices (The Cochrane library, 2001). A uniqueness to the development of the DMM-ID has been field trials during the summer of 2006. Based on these trials, an abridged version of DMM-ID was developed. Several different diagnostic adaptations will be illustrated using diagnostic-specific examples, such as Obsessive Compulsive Disorders, Adjustment Disorders and Autistic Spectrum Disorders.

CLASSIFICATION, INTELLECTUAL DISABILITIES, AND PROBLEM BEHAVIOURS

INSTITUTIONS
1. University of Glasgow, Section of Psychological Medicine, Division of Community Based Sciences, Glasgow, United Kingdom

AUTHORS
1. Sally-Ann Cooper¹, Professor
2. Elita Smiley¹, Dr

Aims/Objectives
To consider utility of classification systems for problem behaviours experienced by adults with intellectual disabilities, via:
1. comparison of criteria;
2. population-based study of presentation and aetiology.

Methods
2. Comprehensive psychiatric assessment of all adults with intellectual disabilities in a defined location, classification of problem behaviours, and measurement of putative aetiological factors.
3. Two years later, repeat psychiatric assessments and classification. Analysis of incidence, remission, and factors predicting incidence.

Results
1. ICD-10-DCR and DSM-IV-TR do not include most problem behaviours, are inconsistent in classification, and lack operationalization. DM-ID follows DSM-IV-TR classification and criteria. DC-LD classifies problem behaviours as psychiatric disorders, or symptoms of other disorders, provides operationalized criteria, and rules regarding behavioural phenotypes and organic disorders.
2. 1,023 (65.5%) participated. Clinically significant problem behaviours had point prevalence of 22.5%, or 18.7% (DC-LD), 0.1% (ICD-10-DCR), 0.1% (DSM-IV-TR).
3. Two years later 651 (69.6%) participated. Incident clinically significant problem behaviours was 4.6%, or 3.5% (DC-LD), 0% (ICD-10-DCR), 0% (DSM-IV-TR).

DC-LD remission was 38.2% (self-injurious behaviour), 27.7% (aggression). Incident problem behaviours were predicted by not living with a family-carer, lower ability, divorce of parents in childhood, and more preceding life events.

Conclusions
Problem behaviours may be episodic with a relapsing-remitting course; aetiology may be psychological, social, developmental, as well as biological. Hence, they share characteristics with other psychiatric disorders, but are mostly not included/inconsistently addressed in the standard manuals. This detriment to future research should be addressed. DC-LD criteria might benefit from further refinement.
In the last years, the interdependence of mental disorders and work has been recognized as being of outstanding importance. This symposium will give an overview of the recent research in this area and will consider clinical relevant aspects.

**WORKPLACE-RELATED ANXIETY AND WORKPLACE PHOBLIA**

**INSTITUTIONS**
1. Charité, Research Group for Psychosomatic Rehabilitation, Berlin, Germany

**AUTHORS**
1. Michael Linden, Prof., MD, michael.linden@charite.de
2. Beate Muschalla, PhD, fpr@charite.de

Objective: Anxiety in the workplace is a special problem as workplaces are especially prone to provoke anxiety. Anxiety in respect to the workplace has to be differentiated from conventional anxiety disorders.

Methods: 230 inpatients from a psychosomatic rehabilitation hospital were investigated with a structured diagnostic interview and a self-rating Job-Anxiety-Scale concerning mental disorders and workplace-related anxieties.

Results: Workplace-related anxieties occurred together with conventional anxiety disorders in 35% of the patients, but they were occurring as a single anxiety phenomenon in 23%. Different qualities of workplace-related anxieties lead to a different amount to participation disorders like sick leave and loss or change of the workplace. Workplace phobic patients had the highest scores in job-anxiety.

Conclusions: Workplace phobia is a measure for the severity of emotional burden and work participation disorder. Workplace-related anxieties and workplace phobia have an own clinical value which is mainly defined by severe consequences in professional and social life participation. They require special psychotherapeutic treatment instead of sick leave.
WORK PROBLEMS OF PATIENTS IN PRIMARY HEALTH CARE?

INSTITUTIONS
1. Charité, Research Group for Psychosomatic Rehabilitation, Berlin, Germany
2. Deutsche Rentenversicherung, Berlin, Germany

AUTHORS
1. Beate Muschalla¹, PhD, fpr@charite.de
2. M Vilain¹, Mrs, michael.linden@charite.de
3. Michael Linden¹, Prof, MD, michael.linden@charite.de
4. C Lawall², Mr, fpr@charite.de
5. M Lewerenz², Dr., fpr@charite.de

Background: Problems at work and requests for sick leave certificates are a daily topic in outpatient care. Return to work management is a special problem in patients with long-term sick leave. In this respect, psychological problems play a central role.

Method: 19 primary health care physicians of different specialties were interviewed and 382 of their patients, who were at present at work, filled in a questionnaire concerning health status, workplace problems and their relation to participation problems.

Results: 27% of the patients stated that they currently have problems at the workplace. Patients with workplace problems had significantly longer durations of sick leave in the past 12 months and they consulted more physicians than the group without workplace problems. They also had disorders of participation in respect to daily duties, housework, family and social activities, or leisure time. 80% of the physicians said that they were dealing with workplace problems of their patients several times a week. Psycho-social problems were most frequent, followed by orthopedic and other somatic problems.

Workplace characteristics were of minor importance. To help their patients, physicians contacted employers but also health insurance or other institutions which provide rehabilitations services.

Discussion: Health-related job problems and especially long term sick leave or of great importance in the daily work of primary care physicians. Psychological aspects are of greater importance than somatic aspects. Workplace related problems of participation are an indicator for a wider spectrum of participation disorders.

WORKPLACE STRESS AND DEPRESSION: THE CASE FOR RESILIENCY BUILDING IN A BRAIN-BASED ECONOMY

INSTITUTIONS
1. The Johns Hopkins Hospital, Workplace Psychiatry, Baltimore, United States

AUTHORS
1. Alan M Langlieb¹, MD, MPH, MBA, alanglie@jhmi.edu
2. M Kaminsky¹, MD, alanglie@jhmi.edu
3. L Everly¹, PhD, alanglie@jhmi.edu

This report will introduce a new paradigm on workplace stress and crisis intervention. Psychological intervention subsequent to workplace stressors and trauma has historically been characterized by reactive, event-centered practices with little or no appreciation for the temporal trajectory of the human response.

A growing critique of this strategy is that not everyone exposed to stress will require assistance and not everyone will benefit from the same type of assistance. In addition to providing an historical context for why a new vision is necessary, we will present a newly developed tri-phasic, outcome-oriented model that uses resistance, resilience, and recovery as a basic framework for organizing care and opportunities around prevention.
EMPLOYMENT STATUS AND VOCATIONAL REHABILITATION OF SCHIZOPHRENIC PATIENTS

INSTITUTIONS
1. Landes-Nervenklinik Wagner Jauregg, Dept. for Psychiatry, Linz, Austria

AUTHORS
1. Hans Rittmannsberger, Prof., MD, hans.rittmannsberger@gespag.at

Work has been an important therapeutic strategy to improve psychopathology of psychiatric, especially schizophrenic patients in the pre-neuroleptic era. Unfortunately the number of schizophrenic patients holding a regular job is rather small these days. There is some evidence, that the rate of unemployment in psychiatric patients has increased in the past decades and that this is not just a byproduct of increasing rates of unemployment in the general population, since employment rates of schizophrenic patients decreased seemingly independent of the situation on the labor market. So it might be for other, mainly structural changes of the working situation which make it increasingly difficult for patients to (re)enter the working force.

On the other hand there are a considerable number of patients willing to work and also being able to work under appropriate working conditions, taken their disabilities into account. This presentation gives an overview about the employment situation of schizophrenic patients, the results of measures of occupational rehabilitation and recent developments in this field.

ECONOMICS OF MENTAL DISORDERS

INSTITUTIONS
1. London School of Economics and Institute of Psychiatry, London, United Kingdom
2. Agency for Healthcare Research and Quality, Rockville, United States
3. Center for Addiction and Mental Health and Dept. Psychiatry, University of Toronto, Toronto, Canada

AUTHORS
1. Martin Knapp
2. Samuel H Zuvekas
3. Carolyn S Dewa

Mental health economics research provides crucially needed information on the socio-economic burden of mental and addictive disorders on patients, family caregivers, workplace and society. This research also analyzes the impact that clinical, social, and financial interventions aimed at psychiatric prevention, care and rehabilitation have on the health, quality of life and economic well-being of the affected populations, and on the society as a whole. The research information on the socio-economic impact of the disorders referring to psychiatry and on the socio-economic impact of the interventions that the specialty is able to offer to society for the care of mental and addictive disorders is fundamental for enabling psychiatrists to advocate properly the needs of the mental health sector and the financing of psychiatric services.
WHAT IS THE ECONOMIC CASE FOR PREVENTION STRATEGIES IN MENTAL HEALTH?

INSTITUTIONS
1. London School of Economics, London, United Kingdom
2. Institute of Psychiatry, London, United Kingdom

AUTHORS
1. Martin Knapp¹,²

Increasing policy attention is being given to the prevention of mental health needs emerging and to the promotion of mental wellbeing more generally. This was a theme of the European Commission’s Green Paper 2005, for example, and is prominent in some national policy strategies. This presentation will offer evidence on whether there is an economic case for investment in preventive programmes, drawing examples from early detection and intervention in relation to psychosis, and from interventions for childhood mental health problems.

THE SHAPE OF DEMAND: WHAT DOES IT TELLS US ABOUT DIRECT-TO-CONSUMER MARKETING OF ANTIDEPRESSANTS?

INSTITUTIONS
1. Agency for Healthcare Research and Quality, United States

AUTHORS
1. Samuel H Zuvekas¹

Much of the debate surrounding Direct-to-Consumer Advertising (DTCA) of pharmaceuticals centers on whether DTCA conveys useful information to consumers or indiscriminately increases requests for the advertised medication. By identifying how DTCA changes the shape of the demand curve for antidepressants, we seek to infer the promotional objectives of manufacturers. Using data from the 1996-2003 Medical Expenditure Panel Survey (MEPS), we find that advertising shifts the demand curve for antidepressants outward and rotates it counter-clockwise. DTCA increases the probability that an individual will initiate use of antidepressants, particularly when out-of-pocket medication costs are low, but does not necessarily increase utilization levels among those already taking antidepressants if prices are high. This is consistent with a promotional campaign that seeks to alert consumers to the product’s existence, but conveys no real information that would allow them to learn their true match with the product.
WORKER MENTAL HEALTH PROBLEMS: WHO BEARS THE BURDEN AND HOW COSTS BE ADDRESSED?

INSTITUTIONS
1. Centre for Addiction and Mental Health, Toronto, Canada
2. University of Toronto, Department of Psychiatry, Canada

AUTHORS
1. Carolyn S Dewa

In this presentation, we will take an international perspective to discuss the burden of poor worker mental health, who currently bears it and how the associated rising costs are being addressed, using an international perspective. In this discussion, we will point out that mental illness is associated with a wide range of costs distributed across multiple stakeholders including government, employers, workers and their families and the healthcare system. The costs incurred by the groups are interrelated; an attempt to decrease the burden for one group of stakeholders will inevitably affect other stakeholders. Thus, the answer to who bears the costs of poor mental health is: Everyone.

CONSENSUS GUIDELINES FOR INDEPENDENT MEDICAL EXAMINATIONS

INSTITUTIONS
1. Melbourne, Australia

AUTHORS
1. Alan D. Jager

Background and Aims: Ethical Guidelines exist to help guide the practice of practitioners. Specialist practice demands that generic ethical guidelines require tailoring to suit the needs of a particular specialty. Subspecialty guidelines are now being developed in psychiatry. This paper examines the process undertaken by the Forensic Section of the World Psychiatric Association in developing a consensus paper for the conduct of Independent Medical Examinations.

Methods: At the XIIith World Congress of Psychiatry in Cairo in September 2005, the Forensic Section Committee of the WPA decided to develop consensus papers in 5 key areas. One of those areas is the subject of this paper. The author was given the task of developing the structure of the guidelines and then consulting widely before final drafting of the consensus paper for wider dissemination.

Results: The guidelines describe the special process of independent medical examination and report writing. They describe the way the psychiatric report should be assembled and examine ethical issues surrounding the preparation of the report. The differences between treating and independent psychiatrist reports are discussed, and emphasis is placed on the need for transparency and for the reporter to be unbiased. The essential components of the report are described and the need for facts to be clearly separated from opinion is emphasized. Finally, advice is provided on how to avoid ethical breaches.

Conclusions: Psychiatric reports need to be undertaken in an ethical manner, include all pertinent information and be presented in plain language.

WHO IS ILL ANYWAY? LEGAL FRAMEWORKS AND PROFESSIONALS’ ATTITUDES ON MENTAL ILLNESS IN ENGLAND & WALES

INSTITUTIONS
1. University of Manchester, United Kingdom

AUTHORS
1. Birgit Vollm

Legal frameworks for the mentally ill or disordered vary widely even across Europe. Of particular relevance are concepts of mental disorder within these frameworks as they determine who may be subject to compulsory measures but also who has access to care.

The definition of mental disorder in the current mental health legislation in England & Wales differs in two important aspects from that of other European countries: Firstly, it is one of few frameworks within the EU which explicitly excludes individuals with drug and alcohol problems from its definition of mental disorder. Secondly, the definition of personality disorders requires “abnormally aggressive or seriously irresponsible conduct” in order for the Mental Health Act to be applicable. These restrictive definitions result in the exclusion of large numbers of patients not only from compulsory measures but also from voluntary treatment due to a lack of service provision.

The underlying assumptions of law and medical professionals resulting in these concepts of mental disorder as well as their ethical and legal consequences will be discussed.
INCONSISTENCY OF NCR ASSESSMENT ON INTOXICATION RELATED MURDER CASES

INSTITUTIONS
1. University of Calgary, Canada

AUTHORS
1. L. Xie

It is noted that there has been inconsistency among forensic psychiatrists in the assessment of criminal responsibility, particularly in the cases of substance intoxication and automatism related cases. This article analyzes the criteria for NCR (not criminally responsible) defense in substance intoxication related issues by reviewing the relevant cases that writer has experienced in Canada, Japan and China. To highlight the point writer presented several cases of first-degree murder for which the defendant applied for NCR defense in Canada, Japan and China. To improve consistency of NCR assessment, we should analyze the timing of the onset of psychotic symptom in relation to substance intoxication, the persistence of psychotic symptoms resulting from substance abuse beyond acute intoxication, the defendant's capacity of appreciating the nature and quality at the time of the offenses, whether the defendant is permanently out of his mind and so entirely incapable of reasoning, and what kind of treatment is available. It is recommended that WPA Section Forensic Psychiatry create some landmark case examples to help psychiatrists from different countries determine the criteria for the insanity defense on substance intoxication related NCR cases.

PSYCHOPATHY AND FRONTAL DYSFUNCTION IN MURDERERS - A STUDY IN BRAZIL

INSTITUTIONS
1. Institute of Psychiatry, Rio de Janeiro, Brazil

AUTHORS
1. F. Jozef
2. R. Adelino Rodrigues da Silva
3. M. E. Delgado Leite

We examined a random sample of 29 normal (non-psychotic) murderers detained on remand and classified them in two groups, using the PCL-R and PCL:SV: Psychopaths (n = 15) and Non-Psychopaths (n = 14). The whole sample of 29 was submitted to neuropsychological tests (Trail Making Test A and B and the WAIS subtests Block Design, Similarities and Digit Symbol) and the Hare PCL-R. The WAIS subtest Block Design was a discriminator between the subgroups of this sample, with the Psychopaths scoring significantly better than the Non-Psychopaths (X² = 5,37; DF = 1; P < 0,05). As Psychopaths had a higher alcohol / drugs dependence/ abuse diagnosis prevalence than Non-Psychopaths in our sample, this factor does not seem to account for the worse neuropsychological performance found in Non-Psychopath Murders. There is evidence that Frontal Lobe Dysfunction correlates positively with homicidal behaviour in Non-Psychopaths. We recommend a better forensic psychiatric evaluation of murderers in our country and the routine use of the PCL-R as a clinical and research tool in Forensic Psychiatry.
CONSENSUS GUIDELINES IN PRISON PSYCHIATRY

INSTITUTIONS
1. Institute of Forensic Psychiatry, Charite University Medicine Berlin, Germany

AUTHORS
1. Norbert Konrad

In some regions of the world mentally ill prisoners are a growing population. Whether or not mentally disordered persons "belong" in prison is primarily a legal philosophical and political problem. The presentation aims to discuss a consensus paper on prison psychiatry. International resolutions and publications from important medical and psychiatric associations are searched for guidelines on prison psychiatry. The United Nations International Resolutions, the Council of Europe, the World Medical Association, the World Psychiatric Association as well as the Oath of Athens (International Council of Prison Medical Services) have addressed prison psychiatry but lack more detailed guidelines in dealing with mentally disordered prisoners.

IMPULSE-CONTROL DISORDERS AND THE LAW

INSTITUTIONS
1. Melbourne, Australia

AUTHORS
1. Alan D. Jager

Introduction: Impulse dyscontrol is a feature of several psychiatric conditions. It is also a variant of normal human behaviour. Many criminal offences result from impulse dyscontrol. The question of how courts deal with impulse dyscontrol is discussed in this presentation.

Method: 264 judgements using the term “impulse control” were examined, and criminal cases were selected from that group and the data analyzed for diagnosis, offence type and the effect of impulse dyscontrol and diagnosis on outcome.

Results: Impulse control disorders are infrequently raised as mitigating or exculpatory factors, but impulse dyscontrol is often raised, either in the presence or absence of a formal psychiatric diagnosis. Judges sometimes find the presence of impulse dyscontrol to be a mitigating factor and sometimes an aggravating factor.

Conclusion: The presence of impulse dyscontrol is a medical concept used in a forensic setting to help explain bad behaviour. The presence of impulse dyscontrol can be a mitigating factor in sentencing, but can also be viewed as a negative prognostic indicator and trigger harsher sentencing. Judges are receptive to the notion that offenders who act impulsively should be allowed some leniency but that attitude does not consistently extend to individuals with mental illness or personality disorders, possibly indicating stigma against those with such conditions.

FORENSIC ASPECTS IN SCHIZOPHRENIA PATIENTS - THE SECURITY MEASURES IN PORTUGAL

INSTITUTIONS
1. Oporto Faculty of Medicine, Portugal

AUTHORS
1. S. Cunha
2. A. Palha

BACKGROUND AND AIMS: The present study was designed to investigate the aggressive behavior in a population of offenders with schizophrenia adjudicated as not guilty by reason of insanity and mandated to receive treatment in a Psychiatric Clinic of a Security Male Prison as a condition of release.

SAMPLE AND METHOD: A retrospective chart review was conducted for 31 offenders. A structured interview was conducted and the psychopathology was assessed using the PANSS. Aggressive behavior was evaluated the week before the crime and the year before the study, using the Overt Aggression Scale - Modified (OAS-M).

RESULTS: A violent act was committed by 32% of the patients before the diagnosis. These patients were significantly more aggressive the week before the offence (p<0.011), against people (p<0.011) and objects (p<0.006), than the year previous the study. It was observed an association between clinical data and OAS-M as well as with the PANSS positive and negative scales.

DISCUSSION AND CONCLUSIONS: The existence of non delusional magical beliefs in these patients was associated with both negative and positive symptoms. Whereas schizophrenic patients often initiate the medical process by help seeking (voluntarily or not), schizophrenic offenders typically enter treatment for this mental disorder through the judicial system.
SUICIDE AND LAW: CHANGING RELATIONSHIP

INSTITUTIONS
1. Institute of Human Behaviour & Allied Sciences, India

AUTHORS
1. Shridhar Sharma¹, Prof
2. Gautam Sharma², Dr.

The relationship between suicide, attempted suicide and law is both interesting and intriguing. The law is a normative discipline, while the sciences concerned with mental health, study and analyze objective phenomena. But the two share a common feature. The law regulates human conduct which itself is a manifestation of the human mind. The law in formulating its rules does take into account the normal mind and the abnormal mind. Suicide and attempted suicide are a state of mind, and remained a crime in many Western Countries till few decade back. However to aid, abet, counsel or procure the suicide or attempted suicide of another person became a new offence created by the suicide Act. In India the law related to “Attempt to commit Suicide” is still punishable and its legal provisions have been debated by the Senior Judges of the Supreme Court of India.

The paper will discuss these issues, which are of great relevance in suicide prevention programme.

TEACHING OF FORENSIC PSYCHIATRY: THE BRAZILIAN EXPERIENCE

1. J.G.V. Taborda¹

In Brazil, forensic psychiatry deals with the fields of forensic practice as well as correctional psychiatry. Given the size of its population there are only few regularly certified forensic psychiatrists (less than 200 professionals for almost 200 million inhabitants). The author reviews the problems this imbalance has created and then describes the efforts made by the Brazilian Association of Psychiatry to stimulate the teaching of forensic psychiatry. Finally, he describes the Program of Medical Residency on Forensic Psychiatry (the first one in Brazil) carried out by the Department of Psychiatry and Forensic Medicine of the Federal School of Medical Sciences of Porto Alegre.
NEW DEVELOPMENTS IN PREVENTIVE DETENTION IN GERMANY

INSTITUTIONS
1. Department of Forensic Psychiatry, Psychiatric Hospital Munich-Haar, Germany

AUTHORS
1. H. Steinböck

After a short introduction to the history of preventive detention in Germany, a survey is given about both main pathways in German penal code, for healthy prisoners and for psychiatric ill persons having committed a crime. Then, there are given a few examples of new developments of security laws and their consequences in the practice of forensic psychiatry. Finally, effects of this development in outpatient maintenance under probation are discussed.

Symposium of the WPA task force on mass violence and mental health.

Violence is a major public health and societal problem, but only recently, it has been shown that violence in infancy has a developmental and psychopathological significance. Mass violence, affecting more than 50 countries and about one billion people prevents the normal development of children threatening their childhood, leaving scars on the psyche and causing development of personality disorders as well as predisposition to adult mental disorders. Mass violence causes civil casualties, migration and displacement of people, and destroys economy and infrastructure. It results in a culture of poverty and insecurity thus affecting mental health in the lives of survivors and population at large. Mental health professionals should raise their voice against mass violence, show international solidarity and collaboration and help in reconciliation, which is needed for prevention of the transgenerational transmission of trauma. This symposium with deal with the violence in childhood, with the phenomena of violence in the field of individual psychology and its dyadic relatedness transferred to the relationship between mass and individual, and finally with the role of media and mental health professionals.
VIOLENCE IN INFANCY

INSTITUTIONS
1. Tel Aviv University, Israel

AUTHORS
1. Miri Keren
2. Sam Tyano

Violence is a major public health and societal problem, but only recently, it has been shown that violence in infancy has a developmental and psychopathological significance. It was once thought that infants cannot be violent because they lack the ability for intentionality. Tremblay et al (2004) have shown that the large majority of 17 months-old infants are physically aggressive towards siblings, peers and parents, and at 42 months, 28% showed little or no physical aggression, 50% showed modest aggression and 22% showed severe levels. The latter were at highest risk of serious violent behavior during adolescence and adulthood. Indeed, the children with behavioral problems at age 3 or 4 have ~ 50% chance of continuing problems in early adolescence. Violence in small children is often the sign of a significant multi-factorial problem that needs to be detected, diagnosed, and treated. Predicting factors of the high physical aggression trajectory group have been identified and should be used as targets for preventive intervention that must address adults, and not only children.

MASS VIOLENCE IN THE THEORETICAL FRAMEWORK OF PSYCHOANALYSIS

INSTITUTIONS
1. Training and Research Institute of the German Academy of Psychoanalysis, Germany

AUTHORS
1. Astrid Thome
2. Hellmuth Cox

The terms „mass“ and „violence“ in Freud’s „Mass psychology and ego analysis“, wrongly translated as „group psychology and ego analysis“, have been connected with each other in a compulsive manner. Freud emphasized the threatening of the ego’s autonomy by the suggestive promise of a release of difficulties of a responsible acting of the mass. The human being is hindered to use its rationality by anxiety, guilt and shame. Instead of facing these feelings he searches for salvation in the mass. This mass psychological understanding remains firm and influential up to date in psychological, philosophical, sociological and generally human scientific concepts up to discussions in the context of analytic group psychotherapy. More or less continuously, the ontologization of destructivity and the ontologization of polarization of culture and mass have become dominant concepts. It is one of the implicit, ideologically coloured aspects of these concepts that one cannot change destructivity. According to this thinking the onset of violent phenomena is fundamentally associated with procedures exclusively driven by instincts. It depends therefore on a specific interpretation of the unconscious, a crucial point in this discussion. Only few and weak objections have been raised against this formulation. The authors want to show that it has been made a generalization of one possibility of the relation mass and individual. Based on a drive theory and under neglect of a concept which comprehends group dynamics as constitutive for unconscious processes the complex competence and responsibility for violence phenomena are denied.
PSYCHOSOCIAL ASPECTS OF VIOLENCE AND MEDIA: IS THERE A PLACE FOR HOPE?

INSTITUTIONS
1. Istanbul Bilgi University, Turkey

AUTHORS
1. Levent Kuey

Scientific models constructed in our efforts to understand the human violence and aggression refer to an interaction of biological, psychosocial, sociocultural and political factors. The psychosocial reference group determines whether the aggressive behavior will be considered as anti-social, pro-social or socially permitted; so the description and classification of aggressive behavior is usually conceptualized in its sociocultural context. On the other hand, one of the crucial issues is whether aggression is a primary or a secondary phenomenon. Even if it is considered as being primary, still, its forms of expression and degree of severity are mostly determined by the psychosocial features of the milieu. These features are internalized from the past, and cover the projections for the future, and shaped largely by the media. This presentation, using many images, will focus on the psychosocial aspects of violence. Human violence will be reviewed in its historical context and the effects of media coverage on violence will be searched. Furthermore, special emphasis will be given to the critics of the paradigm, "seize the moment", which is considered to increase the risk of detachment, of being imprisoned in a timeless milieu, and of the acceleration of the vicious circle of violence.

WHY WAR, AGAIN - THE QUESTION THAT NEEDS AN URGENT ANSWER

INSTITUTIONS
1. Institute of Mental Health, Serbia and Montenegro

AUTHORS
1. Dusica Lecic Tosevski

Many studies have documented that mass violence can have a devastating effect on mental health of the affected population as a whole, especially in the vulnerable groups such as children, adolescents, single mothers, elderly, refugees and detained people. Psychosocial consequences are frequent and many and manifest as stress disorders, including posttraumatic stress disorder, depression, psychosomatic disorders, aggression and violence among the young, somatization, substance abuse, suicide and burnout syndrome of medical staff dealing with traumatized persons, and in those giving psychological aid. Mass violence prevents the normal development of children threatening their childhood, causing development of personality disorders as well as predisposition to adult mental disorders. Moreover, cumulated trauma, or severe and prolonged stress, if unresolved might lead to lasting scars of the psyche such as personality changes, malignant, pernicious memories as well as somatic, brain changes. In addition to that, unresolved hostilities lead to a spiral of violence which might be repeated in future generations through a mechanism of transgenerational transmission of trauma and a compulsive repetition of violence and aggression. Acting against mass violence might prevent this spiral which is endangering mankind as a whole. Mental health professionals should raise their voice against mass violence and put their effort to prevent the causes of mass violence instead of only dealing with prevention of their psychosocial consequences.
SAAMI COSMOLOGY AND PSYCHOTIC PHENOMENA

Institutions
1. University of Tromsø, School of Social Science, Tromsø, Norway

Authors
1. Jens-Ivar Nergaard, Mr., PhD, jensi@sv. uit.no

Aims
The presentation aims at accounting for how traditional Saami cosmology interferes with the experience of certain psychological phenomena that usually are seen as psychotic behavior in western psychiatry.

Methods
Based on a couple of case studies, Saami patients’ psychotic experiences are analysed and discussed from the perspective of traditional Saami cosmology and current diagnostic criteria for psychotic disorders. The analyses of the case studies further aim to bridge the gap between these two positions and approaches by uniting them into one dynamic strategy that holds both for professional psychiatry and an adequate professional cultural analytical position.

Results
A decontextualized psychiatry may negatively interfere with patients with certain cultural backgrounds. Phenomena that are considered normal in the cultural context of the patients may be interpreted as expressions of psychopathology in the medical treatment context. The ability of these patients to cope with their problems by means of their cultural traditions may be strongly underestimated.

Conclusions
Cultural psychiatry focus in a large scale on complex cultural phenomena in the modern global community. The majority of studies apply models where the complexity of individual cases disappear. In this presentation the opposite is the case: The focus is on individual cases without any claims of generalizations. However, the presentation holds the view that more research in this field should lean to ethnographic studies and methods.

HEALING PRACTICES IN TRANSFORMATION - EXAMPLES FROM SAMI AND AMAZONIAN INDIAN TRADITIONS AND THEIR RELEVANCE TO PSYCHIATRY

Institutions
1. University of Tromsø, Department of Clinical Psychiatry, Tromsø, Norway

Authors
1. Randall Sexton, Mr., MD, randallno@yahoo.com

Aims: A cross-cultural exploration of traditional healing practices, their modern transformations and relevance to psychiatry in Northern Norway and Brazil.

Methods:
a) A questionnaire based survey among nearly two hundred psychiatric patients in Northern-Norway, a multi-cultural region with Sámi, Finn and Norwegians, on their use of traditional healing practices and how this relates to their use of psychiatry.
b) Fieldwork and interviews with patients, healers, therapists and users of traditional healing in Northern Norway and Brazil on this use today, and what beliefs and experiences related to it are important for the practice of psychiatry.

Results: The questionnaire study showed that traditional healing modalities are still the most widely used treatments outside of psychiatry. Users were less satisfied with the Western psychiatric services, and a majority of patients were positive towards including traditional healing within the psychiatric services. The interviews include important suggestions about how the psychiatric services might become more in tune with the Sámi culture in Norway.

The field-work study in Brazil shows that the traditional religious and healing uses of a powerful psychoactive brew, Ayahuasca, from the Amazon is finding new uses today, also by health professionals, and reaching wider populations throughout Brazil as well as Europe and North-America.

Despite differences in culture, there are parallels in the modern transformations of traditional healing and their potential implications for psychiatry in these two areas, which can also be of interest for those from other regions.
SPIRITUALITY AND REALITY - MENTAL HEALTH DISORDERS EXPRESSED THROUGH TRADITIONAL SAAMI NARRATIVES

INSTITUTIONS
1. University of Tromsø, Department of Clinical Psychiatry, Tromsø, Norway
2. University of Cambridge, Scott Polar Institute, Cambridge, United Kingdom

AUTHORS
1. Jens-Eirik Nergaard1,2, Mr., jens_eirik@hotmail.com

Aims:
The overall aim with this project is to contribute phenomenologically and theoretically to psychiatric and medical anthropological research with empirical material from Saami-Lästadian communities. The theme for this project is to explore the encounters between the Saami narrative tradition and psychiatry in Northern Norway. Narratives regarding restlessness, or unrest, in people's house constitute important ways of expressing emotional stress or interpersonal unrest in Saami culture. This form of expression is toned down in the encounter with the Norwegian majorities' health-care system for various reasons. The indigenous Saami culture has for many years been in a continuous revitalisation-process. Hence, many Saami - both young and elders, are experiencing much mental distress. Knowledge on this matter is very important in a time where the Norwegian mental health-care system is in dire need of improvement on indigenous issues

Methods:
The project aims to combine clinical interviews with patients and healthcare personnel, as well as conducting anthropological fieldwork within the communities of the patients.

Results:
The fieldwork process is in progress. The project has established contact with a Saami healer. Through this healer, the research fellow has been welcomed into a fraction of this healer's network. Data will be presented for discussion.

SAAMI PATIENTS ENCOUNTERING NORWEGIAN PSYCHIATRY

INSTITUTIONS
1. University of Tromsø, Department of Clinical Psychiatry, Institute of Clinical Medicine, Tromsø, Norway
2. University of Tromsø, School of Social Science, Tromsø, Norway

AUTHORS
1. Tore Sorlie1, Dr., MD, PhD, tore.sorlie@unn.no
2. Jens-Ivar Nergaard2, Mr., PhD, jensi@sv.uit.no

Aims
To study treatment language, use of traditional helpers, treatment, treatment satisfaction and treatment gain in Saami and Norwegian patients at one acute and one short term psychiatric ward.

Methods
Questionnaires were completed by patients and therapists at discharge from hospital. BPRS and GAF were assessed by external Saami bilingual raters at inclusion in project and at discharge from hospital. Sami and Norwegian patients were matched according to sex, age, diagnosis and duration of illness.

Results
31 Saami and 37 Norwegian patients were included and 25 pairs were matched. The Saami patients considered themselves as bilingual Saami and Norwegian. Half of the Saami patients had preferred to speak Saami with their therapists, only one did. An extensive use of traditional helpers was only partly recognized. Despite no differences in type and amount of treatment or symptom-change during the hospital stay, the Saami patients showed less satisfaction with quality of contact with staff, treatment alliance, information and global treatment-satisfaction. The Norwegian therapists evaluated working alliance and quality of contact as significantly better than their Saami patients did. There were no such differences in scores between the therapists and their Norwegian patients.

Conclusion
Poor congruence between the scores of the therapists and their Saami patients in alliance and contact scores was interpreted as a consequence of an adaptive effort in the Saami patients. This made their therapists think that they were more native Norwegian and satisfied than they actually were. Negative consequences of poorer treatment alliance and lack of possibility to use ones mother tongue are discussed.

PSYCHIATRY FOR THE PERSON AND DYNAMIC PSYCHIATRY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany
2. German Academy for Psychoanalysis, Munich, Germany

AUTHORS
1. Maria Ammon
2. Ilse Burbiel

The WPA Institutional Program on Psychiatry for the Person (IPPP), established by the General Assembly in Cairo 2005, promoted by the president Juan E. Mezzich, affirms "the whole person of the patient within his context (as) the center and goal of clinical care and health promotion" (Mezzich, 2007). The authors' concern is to emphasize the importance of the psycho-social context for the persons development on the background of the group dynamic theory of Günter Ammon's Dynamic Psychiatry. According to this view, man, from birth on, experiences a number of conscious and unconscious interpersonal contacts in different groups, especially in groups of his early childhood, which holistically form the biological, psychological, social, cultural and spiritual dimensions of his identity up to developmental processes in the brain. The individual internalizes the structure and the energetic quality of experienced group dynamic processes going along with social energetic networks and fields, which again are externalized in relationships of present groups by means of reflective phenomena. Furthermore the authors will show what integrative meaning this group dynamic view of human development can be for diagnostics and treatment of severe psychic diseases.

PERSONALITY ORIENTED DYNAMIC PSYCHIATRY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Maria Ammon, Dr., daperlin@aol.com

The author gives a differentiated survey on theory and practice of Dynamic Psychiatry. Starting with its roots in Freudians psychoanalysis, ego-psychology, object school, system theory and group dynamic thinking the author contributes to the development of Günter Ammon's work. Of central importance are the concept of identity, the unconscious as area of creative possibilities, the personality structure model, the understanding of health and illness with the gliding spectrum of archaic personality diseases, the concept of group dynamics and social energy, the multidimensionality and androgyny of man, and a multidimensional diagnostic and treatment concept. Man is seen in his wholeness and uniqueness with special consideration of his creative potentials and abilities. The treatment goal is the development of a multi-dimensional identity.
THE GROUP DYNAMIC PRINCIPLE AS AN IMPORTANT PERSON CENTERED ASPECT IN DYNAMIC PSYCHIATRY

IDENTITY AND PSYCHOTHERAPY TODAY: AMMON’S CONCEPT OF IDENTITY THERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, München, Germany

AUTHORS
1. Egon Fabian, Dr., efabian@klinik-menterschwaige.de

While the basic concept of psychiatry, like that medicine in general, implies the healing or alleviation of the disturbing symptom (restitutio ad integrum), psychoanalysis aims at the emancipation of the individual from restrictive conflicts. Ammon’s concept of Identity Therapy goes a step further and sees therapy as a chance for developing the identity of the patient beyond the limitations of one-dimensional polarities such as “healthy/ill”. It broadens and deepens the sense of identity to a therapeutic goal implying the freeing from traditional roles and clichés, using individual development potentials and anchoring the individual in his chosen groups. Following a resumé of Ammon’s concept of identity therapy, the author reviews recent psychoanalytic literature relating to the topic. Eventually, he outlines the relevance of the concept of Identity Therapy for our times - an epoch characterized by frequent narrow and hedonistic life styles and missing identification figures and constituting a favorable background for borderline conditions.
CHRONIC FATIGUE SYNDROME: PSYCHODYNAMIC AND PSYCHOTHERAPEUTIC ASPECTS: A CASE STUDY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Gabriele von Bülow¹, Mrs., G.v.Buelow@t-online.de

The case study is about a 40 years old male patient ‘being too tired to be depressive.’ Etiologic background are neurotic guilty feelings concerning the death of his brother as well as a severe early attachment- and developmental trauma, caused by an insecure attachment to parents who themselves were traumatized as children during war. The lack of emotional presence of the mother led to a social-energetic deficit of the patient, who hardly felt up to the challenges of an adult life - ‘as if he was abandoned at the age of two’. His ability to contact was fundamentally disturbed: contact to himself, his feelings and needs (alexithymia), to people and things. By getting more and more receptive to the supply of social energy of an emotional present therapist and by developing his ability for ego demarcation the level of energy within the patient - his alertness - could increase.

INDIVIDUAL FOCUS IN ADOLESCENCE PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, München, Germany

AUTHORS
1. Erwin Leßner¹, Mr., Erwin.Lessner@gmx.de

The author’s purpose is to show, that we in child psychotherapy must not succumb to temptation of making the patient an object of the treatment. Children have to be understood as active partners in psychotherapy. Their treatment doesn't follow just the expectations of the child’s parents. It can’t be managed without the - at least implicit - consent of the child. To win the consent of the child, we have to win its trust. For that it is necessary that we understand in a deep sense, what the child is suffering from, and that we help him to diminish this suffering. Examples for this shall be reported. Dynamic psychiatry considers human being genuinely as a group being. In each individual therapy we do have the task, to understand the problem of the child or young person as a problem of its group dynamic situation in its life groups too. This understanding leads us to the core of its suffering and is a requirement of healing.
THE RUSSIAN MODEL OF PERSONALITY-ORIENTED PSYCHIATRIC-PsyCHOTHERAPEUTIC TREATMENT

INSTITUTIONS
1. Bekhterev Psychoneurological Research Institute, St. Petersburg, Russian Federation

AUTHORS
1. Nikolai Neznanov', Prof., spbinstb@infopro.spb.su

One should treat not the disease but the patient, this statement of one of the prominent Russian clinicians of the XIX-th century became the main attitude in our medicine and in psychiatry as part of it. The elaborated in Bekhterev Institute by Prof. Myasischev system of personality-oriented reconstructive psychotherapy considers the disturbed relationship/attitude system of the individual as one of the major issues for the development of pathological process. The personality of the patient, his family dynamic and social environment play the central role for the psychosis treatment as well. The distortions and deficits in the ones relationship system develop early in life in the family or so called prime group, according to dynamic psychiatry terminology, therefore it is important to involve family members in the diagnostic and therapeutic process. On the other hand therapeutic setting with the active use of group therapy gives patient the possibility to reconstruct his pathological relationship system under safe therapeutic conditions, work them through and gain new problem-solving strategies and coping skills. As well as G. Ammon in his dynamic psychiatry model we consider the conflict as the possibility for personal growth. The therapeutic system is divided in several stages depending on the severity of patient state.

WHAT MEANS ETHICS IN PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany
2. German Academy for Psychoanalysis, Munich, Germany

AUTHORS
1. Maria Ammon
2. Ilse Burbiel

After an overview of the actual discussion of ethics in psychoanalysis and psychiatry, the authors line out the conception of ethics in Dynamic Psychiatry. Starting with Günter Ammon's view that ethics is the basis for a humanistic image of the world. In Dynamic Psychiatry, man is seen holistically as a unity of body, mind and spirit, as an individual human being striving towards identity and self-realisation. The integration of man's multidimensionality with its various dimensions into the core of the personality and the liberation of man from the chains of concreteness and thinking in categories is the most important ethical task in therapy. The holistic view of man includes the dimensions of creativity, time and experience of time, illness, health, work and activity, androginity, body and body experience, death and dying, religion, sexuality, identity, thinking and much more. The therapeutic conception of Dynamic Psychiatry is based on the processual understanding of health and illness. Replacing the category of illness by a conception of dysregulation of the homeostasis of body, mind and spirit, the conflicts of a damaging dualistic thinking can be abolished. The ethical implications of good and bad are seen in a holistic, not in an absolute way.
ETHICAL ASPECTS IN PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Maria Ammon¹, Dr., dapberlin@aol.com

After an overview of the actual discussion on the topics of ethics in psychoanalysis and psychiatry, the authors outline topics like ethical principles in science and research, abstinence-acting in psychoanalysis, empathy and ethics and ethics, morality and politics in psychiatry and psychotherapy and furthermore the conception of ethics in Dynamic Psychiatry. Günter Ammon’s view that ethics is the basis for a humanistic image of the world, the authors stress the meaning that the rights of man have to be higher than the cultural and ideological rights. In his scientific work, Ammon dealt with questions of guilt and guilt feelings as well as liberty and the ability for peace in mankind.

ETHICAL PREPOSITIONS IN PSYCHIATRY AND PSYCHOTHERAPIES

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Daniel S. Kipmann¹, Prof., s.d.kipman@wanadoo.fr

-1- Many of us are confusing ethics, morality, deontology, and often ideology. Citizens’ majority does the same confusion. And, also of course, many patients, and moreover the more litigants of them; The first question is how separate it.

-2- The ethical questioning increases some complexity in our activities, practices, methods, all the more that rules, laws and guidelines adds often to confusion.

-3- Perhaps we can differentiate, inside a set of ethics, - medic ethics, including duty of information, search of contentment without pressure or seduction,... - care ethics, based on quality of relationship, and what is a professional relationship including transference and counter transference.

-4- Please, be sure that it is NOT some guidelines, but professional indications, far from pity, compassion and other arguments which have links with ideology, mot reality and religion, but to give a collective reality. I mean that they are internal rules of personal agreement, in a professional way, with, as a goal, help the patient to avoid anxiety and suffering, and to treat the illness.

-5- In France, but probably all over the world, political decisions and speeches, we are in a position between decisions cj leaely against medical and psychiatric ethics, and more and more rules of conduct.
ETHICS AND MODERN CLINICAL PRACTICE

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Florence Quartier¹, Dr., florence.quartier@worldcom.ch

In a fast-moving world where traditional landmarks are constantly changing and disappearing, it is not enough to let the question of ethics hang over practitioners as purely a consideration from outside. On the contrary, it should be embodied in modern clinical practice. Our aim is to open a discussion with the participants on this subject, based on a couple of brief examples:

1. Explaining to a patient what we know - and what we don’t know about the root of his problem, puts us at the centre of an ethical reflection on our role and our identity.

2. To define clearly what it is in our work that sometimes leads us to offer advice, holds us back from giving explanations, pushes us insidiously towards exerting influence, even attraction, results in a change in therapeutic dialogue: and this is in itself constitutes taking an ethical position.

The time has come to bring this reflection to the heart of our work, even when the solution seems evident; and to do this with and for the patient, his circle and all concerned in his treatment.

EMPATHY AS A CORE ETHICAL DIMENSION IN PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Gabriele von Bülow¹, Mrs., G.v.Buelow@t-online.de

Empathy nowadays is understood to be an essential dimension of ethics. This is not trivial, but a new development of the philosophical discipline of ethics, which for a long time focused on the virtue of justice as a solely rational one. Fonagy et al. (2002) defined empathy or emotional resonance as the “accessibility of a mechanism, which enables the individual to take the perspective of another person and to infer his inner emotional state and to a certain degree to share it.”

Without empathy on the part of the psychotherapist, no psychic healing of the patient is possible. Moreover this lecture wants to demonstrate that, given a certain phase of the therapeutic process, it is crucial for the development of mental health to encourage and demand the ability for empathy on the part of the patient - towards his significant others as e.g. his children and, sometimes, “even” the therapist.
THE TRADITION OF INTERPERSONAL RELATIONSHIP AND DYNAMIC PSYCHIATRY

INSTITUTIONS
1. German Academy for Psychoanalysis, München, Germany

AUTHORS
1. Egon Fabian¹, Dr., efabian@klinik-menterschwaige.de

The author differentiates between the historical tendencies in the development of psychoanalysis since Freud: the intraindividual, conflict-centered, and the interpersonal, relationship-centered. The emphasis on the therapeutic rapport as an essential factor in psychotherapeutic treatment has its roots in the works of Ferenczi, Balint and Sullivan. The therapist who treats patients with early disturbances must, as Ammon points out, show himself to the patient as a "whole person".

In this connection, Ammon's contribution is to have enlarged the scope of interpersonal relationship by the dimension of group dynamics and having conceived of the group as source of interpersonal ("social") energy. By propounding an image of man as an individual possessing the ability to develop at any age, Dynamic Psychiatry shows a basically optimistic attitude with important therapeutic and ethical implications.

AUTHORS
1. Peter J. Verhagen¹, mr., MD, verhagen.p@wxs.nl

This section symposium focuses on recent research on:
- affective aspects of religiousness in later life
- quality of life, spirituality and religiosity and cognitive decline
- recognition of core psychiatric (psychotic) symptoms among chaplains

These insights may inform clinical practice.
GOD IMAGE IN OLDER ADULTS IN THE NETHERLANDS: RECENT RESEARCH FINDINGS

INSTITUTIONS
1. Altrecht Mental Health Care, emergency psychiatry, Utrecht, The Netherlands

AUTHORS
1. Arjan W. Braam¹, dr., MD, PhD, a.braam@vumc.nl

Affective or emotional aspects of religiousness are considered to be crucial in the association between religiousness and well-being, especially in later life. The emotional aspects of religiousness, can be understood as pertaining to the God image, or better defined as the God-object-relationship, corresponding to feelings of trust towards God or to religious discontent. In the current contribution, empirical findings are discussed about associations between God image, depressive symptoms, feelings of guilt, and personality characteristics, such as defined by the Five Factor Model of Personality. Feelings of discontent towards God correlated positively with hopelessness, depressive symptoms, feelings of guilt, and also with depressive symptoms assessed 13 years earlier; these findings pertained to Protestant participants in particular. Most facets of God image, positive, critical, and about punishment reappraisals, were associated with more feelings of guilt. A possible explanation for the most pervasive finding, that feelings of discontent towards God are related to depressive symptoms, is that both, throughout life, remain rooted in insecure attachment styles. Neuroticism was associated to feelings of anxiety towards God as well as discontent towards God. Agreeableness was associated to perceiving God as supportive and to prayer. These findings persisted after adjustment for depressive symptoms.

CHAPLAIN’S MANAGEMENT OF RELIGIOUS DELUSIONS: A CASE VIGNETTE STUDY

INSTITUTIONS
1. De Grote Rivieren, Elderly Psychiatry, Dordrecht, The Netherlands

AUTHORS
1. Annemarie Noort¹, Mrs., MD, noort.a@planet.nl

Especially among members of religious congregations, the chaplain takes a crucial role in the first counselling of psychosocial problems. Among the range of presentations, psychotic symptoms may occasionally occur, sometimes with a religious or spiritual content. To explore the ability of chaplains to recognize the difference between psychiatric problems with a religious content and religious problems requiring the assistance of a chaplain, a vignette approach was employed. Selected in a region of the Netherlands with a population characterised by relatively high levels of orthodox Calvinist beliefs, 143 chaplains of several denominational traditions were interviewed. Thirty one chaplains belonged to strict Calvinist congregations (mostly vicars), 36 had moderately conservative Protestant background (mostly vicars), 36 were Roman Catholic (mostly priests) and 37 were elders from Evangelical congregations. The vignettes pertained to a young man with schizophrenic psychosis, a mystical/spiritual experience, a grief reaction with a religion-based moral dilemma, and a melancholic old man with religious delusions. One main result is that the last vignette was recognised both as a psychiatric case, as well as that the spiritual content should be addressed by the chaplain. Other results, pertaining to the denominational differences will be discussed. A main conclusion is that knowledge of psychiatry is also relevant for chaplains, and that some additional education on psychopathology for chaplains is warranted.
COGNITIVE DECLINE IN ALZHEIMER DISEASE: IMPACT OF SPIRITUALITY, RELIGIOSITY, AND QOL

INSTITUTIONS
1. Herzog Memorial Hospital, elderly psychiatry, Jerusalem, Israel

AUTHORS
1. Yakir Kaufman, Dr., MD, ykaufman@herzoghospital.org

To assess effects of quality of life (QOL), spirituality, and religiosity on rate of progression of cognitive decline in Alzheimer disease (AD). Methods: In this longitudinal study, we recruited 70 patients with probable AD. The Mini-Mental State Examination was used to monitor the rate of cognitive decline. Religiosity and spirituality were measured using standardized scales that assess spirituality, religiosity, and organizational and private religious practices. We conducted a simultaneous multiple linear regression analysis for factors contributing to rate of cognitive decline.

Results: After controlling for baseline level of cognition, age, sex, and education, a slower rate of cognitive decline was associated with higher levels of spirituality (p < 0.05) and private religious practices (p < 0.005). These variables accounted for 17% of the total variance [F(11,58) = 2.24, p < 0.05].

9. Rachid Bennegadi

During the past fifty years, there has been a surge of immigration to countries in North America, Europe, Australia and elsewhere. However, during the first decade of the 21st century, and especially since the terrorist acts of Sep 11, 2001, some of those same countries have changed their policies about immigration in the face of public pressure to ensure more secure borders and reduce the risk of terrorism.

This symposium, comprising two parts and nine presentations, addresses the changes in public sentiment and government policy concerning the in-flow of migrants to countries in North America and Europe during this decade. These complex issues related to immigration are described and analyzed by presenters who have been actively engaged in these issues in Canada, USA, Britain, France, Spain, Germany, the Netherlands, Denmark and Switzerland. Their presentations will also address changes in acculturative stress and emotional distress among immigrants engendered by post-9/11 fears of terrorism.
YEARNING TO BREATHE FREE; IMMIGRATION TO THE USA SINCE 9/11

INSTITUTIONS
1. Brown University/Butler Hospital, United States

AUTHORS
1. Ronald Wintrob

Legal immigration to the USA has been increasing steadily in each decade since the 1970s. There has been strong public support for an immigration policy that welcomes legal immigrants, as well as refugees from war-torn regions of the world. That 'open-door' policy has been challenged, but not reversed, since the terrorist attacks of 9/11/2001.

Between 2000 and 2005 the numbers of legal immigrants to the USA has risen from 9.8% to 12.4% of the total US population. However, the number of refugees and asylum seekers has been declining since 2000.

The US Congress has deadlocked on efforts to revise immigration policy since 9/11. Public sentiment has clearly favored secure borders and responded to fears of terrorism. Immigrants living legally in the USA have experienced mounting anxiety about discrimination and fear of being mistaken for illegal immigrants and deported.

These fears and experiences of discrimination since 9/11 have undermined the sense of security of large numbers of immigrants, and increased the incidence of psychiatric distress symptoms among them.

This presentation reviews data about these issues and discusses their implications for immigration policy and for the provision of mental health services for immigrants and refugees in the USA.

THE ERA OF TERRORISM: ETHICAL DILEMMAS AND EDUCATIONAL NEEDS

INSTITUTIONS
1. Centre for Transcultural Psychiatry, Rigshospitalet, Copenhagen, Denmark

AUTHORS
1. Marianne Kastrup

With the strong focus on terrorism in recent years there is an increasing concern that fundamental human rights may be violated in the interest to combat acts of terrorism. It is in particular in situations of interrogations that persons may be exposed to various kinds of interrogation techniques that go against international conventions.

According to Article 10 of the UN Convention of 1984 against torture and other cruel, inhumane or degrading treatment or punishment, states having signed the Convention shall ensure that education and information regarding the prohibition of torture are included in the training of e.g. medical personnel who may be involved in the custody, or treatment, of individuals deprived of their liberty. Unfortunately, few countries enforce this, implying that few psychiatrists receive any such education and thus have little knowledge on the issue of organised violence in relation to terrorism.

Knowledge about the mental health consequences of state-perpetrated violence, including torture, is of clear clinical relevance for psychiatrists worldwide as a significant proportion of e.g. refugees and migrants have experiences of war, strife, persecution and torture and a large proportion of the world’s population lives in countries that condone torture.

The paper will outline the psychiatric symptomatology following exposure to state-perpetrated violence and torture, preventive considerations as well as ethical dilemmas and educational needs for the psychiatric profession.
A LIGHT AT THE END OF THE TUNNEL; IMMIGRATION TO GERMANY BEFORE AND AFTER 9/11

INSTITUTIONS
1. Hanover Medical School, Social Psychiatry and Psychotherapy, Hanover, Germany

AUTHORS
1. Wielant Machleidt

Germany, geographically located in “the heart of Europe”, has been a host country for immigrants for centuries. The German constitution after World War II guaranteed immigration and asylum for everybody, especially for war refugees and those who suffered from political persecution and racism.

However, the increasing flow of immigrants from south-eastern Europe (Turkey and the Balkans) in the 1970s and 1980s generated increasing resistance to further immigration and led to discrimination against those foreigners. The attitude of hospitality toward migrants switched to hostility by the 1990s.

As a consequence, the German government revised its constitution and immigration laws to restrict immigration. When the terrorist attacks on the WTC towers took place on 9/11/2001, German immigration laws were already the most restricted the country has had in its recent history. Germany had not been a major focus of terrorist activities in recent years. But because it was a country in which terrorist attacks were planned, laws were passed allowing for increased surveillance of immigrants, and even of German citizens.

As a consequence, the annual number of immigrants did not increase since 1998, and for the first time since 1950, diminished significantly during the years 2004 and 2005. Nevertheless, Germany continues to have one of the highest percentages of citizens who are foreign-born (20%) among European countries.

Currently, there is an increasing acceptance of immigrants once again and a new policy to help in their integration has been introduced by the German government.

IMMIGRATION AND ACCULTURATION IN THE NETHERLANDS, IN THE LIGHT OF TERRORISM

INSTITUTIONS
1. Centrum '45 Centre for Treatment of Traumatised Refugees, The Netherlands

AUTHORS
1. Hans Rohlof

The Netherlands is not an official immigration country: immigration is not encouraged and there is no official quota for immigration. Nevertheless, there are two groups that have immigrated to the country during the 1990s: families of former migrant workers from Turkey and Morocco, and refugees from Eastern Europe, Africa and Asia. The numbers of immigrating individuals increased because of possibilities of family reunion, because of the wars in Bosnia and other places, and because of growing possibilities to travel.

After the acts of terrorism in recent years, political right wing parties started a public debate focused on immigration as a danger for Western democracies. This debate has become increasingly extreme and has had a direct effect on immigration policy and numbers: policy became stricter, numbers decreased.

After the murder on Theo van Gogh in 2004 we performed a study on the effects of this highly publicized event on patients in mental health care. The public paranoia and mistrust in different population groups was clear. A new target of mental health care is to help migrant patients adapt themselves to a multicultural society where there is a growing animosity between population groups. Clinical implications of this attitude will be discussed.
The war in Iraq, which started in 2003, is still ongoing. Initially, the war provided the Iraqi people with the possibility to put an end to a dictator regime which used terror against its own people. However, the war also brought with it several disasters. Internal conflicts between different militant groups and alliance troops have caused an environment characterized by socioeconomic chaos. Bomb explosions have become a part of the daily life of the Iraqi people. Civilians are afraid to go to work or even to send their children to the schools due to the risk of kidnapping.

A small part of the refugees are provided with the possibility to seek asylum in different parts of Europe and other countries around the world. More than 60,000 Iraqi refugees have fled to Sweden since 2003. Approximately 45,000 of these have been provided with accommodations while the remaining refugees are still waiting. The large number of Iraqi refugees entering Sweden has put the country and its health, social care services and school system in front of a large number of challenges.

This presentation will discuss the problems we experience when working with newly arrived Iraqi refugees that are admitted to our centre for treatment and psychological support. Long term exposure of stress, fear and accumulated traumatic situations influence the newly arrived refugees' psychosocial life and make it difficult for them to commence an active life in the new country.

IMMIGRATION AND ACCULTURATIVE STRESS IN AN ERA OF FEAR OF TERRORISM – PART 2

This presentation will explore the impact of the current climate of fear about terrorism on the mental health of immigrants, refugees and visible minorities in Canada. Canada has been a nation of immigrants from its inception with about 18% of the current population born outside the country. Although migration policies have always been discriminatory, the post 9/11 climate of fear has fostered a new level of suspicion with increases in racism, discrimination and exclusion. In Quebec, a political debate on ‘reasonable accommodation’ focused on the extent to which the dominant society should adapt to the values and practices of newcomers. This debate singled out specific religious and cultural groups (Muslims, Jews and visible minorities) and allowed xenophobic and racist elements of society to voice their fears and hostility toward whole segments of society. The heightened concern with security has had negative effects on the health and wellbeing of both children and adults among minority groups and newcomers as documented in surveys and clinical work. In addition to this impact on vulnerable groups, mistrust of the ‘Other’ damages the fabric of civil society with potentially negative effects for everyone. The dynamics of this mistrust will be illustrated with cases drawn from our cultural consultation service. The Canadian ideal of multiculturalism requires renewed commitment to counteract the stereotyping and exclusion that have resulted from the political manipulation of fear.
PSYCHOLOGICAL CONSEQUENCES OF THE FEAR OF TERRORIST ATTACKS

INSTITUTIONS
1. University of Barcelona, Spain

AUTHORS
1. Joseba Achotegui

The terrorist attacks on the trains in Madrid on 11th March 2004, with 194 deaths and over 1000 people injured, led to great social turmoil in Spain, but public manifestations of that distress did not occur. There was not one anti-immigrant demonstration or act of revenge. For the Muslim immigrants, however, it meant the breaking of a link, the start of a situation in which they have become permanently subject to suspicion, despite the fact that one third of the victims were immigrants and many were Muslims.

Faced with this situation, our immigrant mental health care department, Sappir, has noted a significant increase in paranoid-type problems.

I shall present the case of a young immigrant of Kurdish origin who, as a result of the terrorist attacks on 11th March 2004, started to have delusions of being followed. Mustafa is 29 years old, a teacher of Arabic and studies philosophy. He is married to a Spanish woman and speaks Spanish and Catalan fluently. Mustafa thinks that the greengrocer, the baker, the mechanic and other shopkeepers are all police informers who are spying on him. When he travels by car, he is convinced that other vehicles follow him and cause him to make dangerous manoeuvres. He maintains his normal activity, but says that he is suffering great “moral harm” through being followed.

The relationship between his personal story, migratory stress, symptomatology and health care are analysed.

ISLAMOPHOBIA AND THE MENTAL HEALTH OF MUSLIM MIGRANTS IN THE UK POST 9/11

INSTITUTIONS
1. University College London, London, United Kingdom

AUTHORS
1. Simon Dein

There has been an escalation of anti-Muslim sentiment in the UK following 9/11 largely fuelled by the public perception of Islam as fanatical, and fundamentalist. "Islamophobia" is a term deployed to refer to forms of prejudice, exclusion and violence toward Muslims that have risen to new levels over the past 20 years. Islamophobia contributes towards health disparities among Muslim minorities in terms of both physical and mental health. Disparities are mediated by two processes: intersectionality and differential racialisation. "Intersectionality" refers to cases in which individuals or groups experience prejudice toward multiple attributes of their identity. Muslims in the UK and the US are differentiated by race, ethnicity, national origin, social class and immigration status, any of which can result in being the target of social bias.

"Differential racialisation" means that each minority or targeted group becomes defined in relation to a given majority group, often in terms of being “more” or “less” similar. These issues are discussed in relation to new immigrants in the UK.

Religious discrimination has significant effects on mental health. Discrimination at work and “chronic daily hassles”, including insults and assaults, can increase the risk of common mental disorders such as anxiety and depression. It can also influence access to and the use of health services.

The presentation ends by discussing how these cultural issues can be overcome in health-care related settings, particularly focusing upon the importance and limitations of cultural competency training.
MIGRATION IN FRANCE: MYTHS AND REALITY

INSTITUTIONS
1. Minkowska Institute, Paris, France

AUTHORS
1. Rachid Bennegadi

In Europe, the long-term objective of the European Commission is to integrate all the elements of border management to be managed by a Europe-wide integrated service. As part of this strategy, it is intended to develop joint training and reciprocal personnel exchanges within the Schengen area. Europol will have an increasingly important role in addressing criminal activities in the Schengen area, and moves to secure common standards in the use of technology and document security can be expected. What could be the link between this strategy and reinforced laws concerning immigration. A review of the media coverage of this topic will be presented and discussed relevant to immigration policy in France from 1950 through 2007.

CULTURE, POLITICS, AND SOCIAL CHANGE AFFECTING MIGRANT MENTAL HEALTH IN SWITZERLAND

INSTITUTIONS
1. Swiss Tropical Institute, Basel, Switzerland

AUTHORS
1. Mitchell Weiss

The politics of immigration rage with renewed vigour throughout the world. In Switzerland, such questions have long been topical in a setting characterised by resistance to social change and policies that may deny Swiss-born children of immigrants full social acceptance as citizens. In a recent political election, a campaign poster depicting 3 white sheep kicking out a black sheep sparked a national controversy, protest, and confrontation that became a focus of international attention. The campaign also linked criminality to foreigners living in Switzerland.

With a total population of 7.57 million in 2005, 1.66 million (21.9%) were classified as foreign residents, and the annual immigration was 99,091. The largest number of foreign residents was from Italy (303,455) and other European countries (1,412,987 from all of Europe). As the leading non-European country of origin, Turkey constituted the fifth most common nationality of foreign residents (78,711). In addition to immigrants who provide labour, services, and technical expertise, foreign residents now also include asylum seekers from conflicted areas (e.g., 46,773 from Bosnia and Herzegovina).

This changing character of migration has renewed questions that were resolving from previous waves from neighbouring countries. Migration and mental health policy has been concerned with utilization of psychiatric services and questions of adjustment to an ambivalent reception that grows more hostile in an expedient political climate. This paper considers priorities for mental health policy, services, and research with reference to current needs and changing perceptions of migrants over the past several decades.
INTER-RACIAL AND INTER-ETHNIC MARRIAGE

In this symposium, we describe the historical and social trends about inter-racial and inter-ethnic marriage in North America, Europe and Asia. Each presenter addresses the issues from both cultural and clinical perspectives; specifically for the USA, Denmark, the Netherlands and Japan.

INTER-RACIAL MARRIAGE IN THE USA

INSTITUTIONS
1. Brown University/Butler Hospital, Psychiatry and Human Behavior, Providence, United States

AUTHORS
1. Ronald Wintrob\(^1\)

For people who value cultural diversity, it is distressing to be made aware that racial prejudice continues to be manifest in everyday life in the USA, despite the progress in civil rights legislation over the past 40 years, since the assassination of Martin Luther King Jr.

It still comes as something of a shock to realize that until the 1960s, most southern US states had laws against inter-racial marriage. The landmark court decision overturning such laws was in 1967, in Virginia. But it took until 2001 for the last southern state, Alabama, to remove from its constitution the ban on inter-racial marriage.

The number of inter-racial marriages in the USA has increased from less than 50,000 in 1967, to more than 500,000 now; representing more than 8% of all US married couples. The numbers would be very much higher for inter-ethnic marriages.

This presentation reviews statistical data and demographic trends about inter-racial marriage in the USA over the past 40 years. Influences on de-stigmatization of inter-racial marriage will be considered, and some of the psychological, social, educational and political implications of inter-racial marriage will be discussed.
MY EXPERIENCE AS A CONSULTANT FOR INTER-MARRIAGE WORKSHOPS IN VANCOUVER CANADA

INSTITUTIONS
1. Taisho University, Japan

AUTHORS
1. Fumitaka Noda

As a psychiatrist who is interested in cross-cultural mental health, I have seen many cases of inter-racial marriage. I have seen both happy and unhappy sides of inter-marriage histories. Inter-marriage involves complex cross-cultural issues, i.e. issues of background, cultures, languages, difference of customs, relationships with in-laws and relatives, food preference, ways of raising children, etc.

The intermarriage workshop was initiated by a group of Japanese-born women, living in Vancouver, Canada, in 1996. They were all women who were partners in inter-racial marriages, mainly with Canadian men who were white, English speaking and Canadian born.

They felt that there was a considerable need among them to help each other. Until then, there was very little information about how many intermarried couples were living in the Vancouver area and how they were coping with their inter-racial marriages.

I was recruited as a consultant for this workshop. It was quite interesting to see that a substantial number of Canadian husbands became involved in the workshop, although it was originally planned to help and support Japanese women intermarried with Canadian men. Accordingly, the workshop gradually changed from being Japanese-oriented and mono-cultural to being bilingual and bicultural.

This series of workshops continued from 1996 to 2003 and made a positive contribution to supporting intermarried couples both socially and psychologically.

The workshops also played a great role in raising the awareness among unmarried Japanese women living in Canada about how demanding and difficult, but also how satisfying intermarriage can be.

PSYCHIATRIC PROBLEMS IN DESCENDANTS OF DIFFERENT ETHNIC BACKGROUNDS

INSTITUTIONS
1. Centre for Transcultural Psychiatry, Rigshospitalet, Copenhagen, Denmark

AUTHORS
1. Marianne Kastrup

A nationwide study was carried out comprising 50,877 persons, who in 2003 were registered in the Danish Psychiatric Register or the National Patient Register with a psychiatric ICD-10 diagnosis.

Of the population 4.0 % descendants with one Danish born parent and one migrant parent; 0.7 % descendants with both parents born outside Denmark; 87.1% were ethnic Danes; 7.8 % migrants, and 0.3% foreign adoptees.

The five groups had significant differences in diagnostic distribution and utilization of psychiatric care.

Among the descendants of mixed background we saw particularly in young women a significantly higher contact rate for nervous disorders, personality disorders, and self-mutilating behaviour compared to young Danish women.

The paper will discuss possible explanations to these findings in terms of e.g. cultural identity, acculturation and gender issues.
INTER-ETHNIC MARRIAGE IN THE NETHERLANDS: FACTS AND CLINICAL IMPLICATIONS

INSTITUTIONS
1. Centrum '45 Centre for Treatment of Traumatised Refugees, The Netherlands

AUTHORS
1. Hans Rohloff

In the Netherlands, 80% of all marriages are between individuals of original Dutch origin; after 10 years 17% of these couples have separated. Marriages between individuals from Turkish origin have led in 20%, of Moroccan origin in 30%, and of Surinam origin in 40% of the cases to a separation after 10 years.

Mixed marriages between Dutch citizens and an individual of Moroccan and Turkish origin have led to a separation in 70% of the cases after 10 years. Problems with norms and values, religion, family interaction, and mutual understanding are some of the most common complaints in mixed marriages.

Although mixed marriages can lead to better communication between population groups, most marriages do not seem to be stable. The minority of stable mixed marriages is characterised by mutual respect and acceptance of cultural diversity.

In clinical practice, family therapy seems to be the answer to the problems mixed marriages have. In this therapy much attention should be given to the mutual understanding of each others' norms and values. In fact, a new family culture should be invented, which is a combination of the cultures of both parents. Examples of this family therapy will be presented.

5. John Cox⁵, Pr, MD, PhD, john1.cox@virgin.net,

This symposium will highlight the importance of the mental health of parents before, during and after childbirth.

The prevention and treatment of perinatal mental disorder are public health priorities in rich and poor countries. This symposium will highlight current knowledge about the diagnosis and management of ante-natal and post-natal mental disorder as they may affect the development of the foetus and the growth of the infant. The importance of perinatal mental health was recognised in the World Health Report 2005, 'Make every mother and child count', which drew attention to the lack of co-ordination between ante-natal and post-natal health services.

This symposium will show recent innovations in therapeutic settings in maternal and infant mental and community health settings. Transcultural aspects will be detailed and management of both emergency health services and preventive care will be presented and discussed.

The speakers will reflect on the public health policy implications of new data in this field including the evidence, that supportive interventions during pregnancy in vulnerable families have beneficial effects.

This symposium will continue the WPA institutional programme launched in Melbourne in December 2007 on parent and infant mental health.
AN INNOVATIVE RESPONSE TO ANTENATAL AND IMMEDIATE POSTNATAL DISTORSIONS

INSTITUTIONS
1. Erasmus Hospital, Perinatal Psychiatry, Antony, France
2. University Denis Diderot Paris 7, Human Clinical Sciences, Paris, France

AUTHORS
1. Gisele Apter, Dr, MD, gisdanap@aol.com

Pregnancy is the time during which psychological preparation for mothering takes place. Self-depreciation and undermining of self-esteem may create situations where women feel unable to care for their newborn. This means that we need to reach out and offer specialized psychiatric care during this period. Physical follow-ups and maternal motivation during pregnancy facilitate acceptance of treatments. The antepartum and the peripartum are thus a blessed period for care.

Working with organized networks of health care including Ob-Gyn, pediatricians, nursery nurses, midwives, psychologists, psychiatrists and GP’s we have set up an itinerant emergency team that moves to mothers wherever they be during the peripatum and address their issues so as to directly organize care on one hand and manage specific issues on the other whether they be medical, psychological, and/or social. This complex organization has necessitated years of learning to work between institutions and organizing public health means to enhance maternal and infant well-being. The setting will be described and clinical examples presented.

THE HOME : HOW TO PLAY WITH MOTHERS AND INFANTS IN AN ADAPTABLE INPATIENT SETTING

INSTITUTIONS
1. Nantes University Hospital, Infant Psychiatry, Nantes, France

AUTHORS
1. Nicole Garret-Gloanec, Dr, MD, nicole.garret@wanadoo.fr

The HOME is part of the equipment that the infant psychiatric sector has to offer to patients. However it can only function linked to all of the other public health care that is organized around the mother and the infant during the peripartum. In this paper this specific unit will be described and moreover how it is articulated among the general mental health care that is provided for pregnant and young mothers in western ocean-side France. Both the specificities of the care delivered and the links with the general health system will be described. Its advantages and difficulties will be discussed. Its applications in other mental health systems open to debate.
WORKING TOGETHER WITH PARENTS TOWARDS PARENTHOOD

INSTITUTIONS
1. Tel Aviv University, Geha Infant Mental Health Unit, Tel Aviv, Israel

AUTHORS
1. Miri Keren1, D, MD, olkeren@internet-zahav.net
2. Sam Tyano1, Pr, MD, styano@post.tau.ac.il

We will apply different concepts to formulate the dynamics of how we work with parents referred with their infants when having difficulty facing parenthood.

We will use different concepts to describe how our setting has relied on different theories to set up our clinical program. First, Winnicott describes the “maternal primary preoccupation” and Leckman has recently found neurobiological correlates linked to this very special psychic state that reflects transition to parenthood in the first two months after delivery, in fathers as well as in mothers. Second, Stern has contributed an additional dimension by describing the content of this psychic change under what he named “the maternal constellation”. Finally, Raphael-Leff has observed the patterns of maternal and paternal reactions to the pregnancy itself.

Each of these concepts will be developed to show how they can be used in a clinical setting to enhance parental skills and both parental and infant mental health.

Babies, Mothers, Cultures & Migrations: A Clinical Perspective

INSTITUTIONS
1. Avicenne University Hospital, Infant Psychiatry, Bobigny, France

AUTHORS
1. Taieb Ferradji1, Dr, MD, taieb.ferradji@avc.ap-hop-paris.fr
2. Marie-Rose Moro1, Pr, MD, PhD, marie-rose.moro@avc.ap-hop-paris.fr

Ethno-psychoanalysis as part of transcultural psychiatry applied to infant mental health problems will be analysed in this paper. This discipline is formed by the association of Psychoanalysis and Anthropology with the aim to understand and treat situations in which a family or parent/child group have moved from one culture to another. The importance of cultural myths, taboos and modes of understanding relationships, child development and needs, and manifestations of dysfunctions will be discussed.

We will analyse therapeutic consultations during the perinatal period in situations of exile and migration. This period is particularly vulnerable for children and families. Cultural and family myths acquire great importance during this period, they can be denied or abandoned according to the requirements of the “new” culture, while being vividly present in the mind of the parents, even if unconsciously. The use of ethno-psychoanalytic principles as “complementarity” (the importance of anthropological understanding of clinical manifestations) and a therapeutic model of consultation, for instance the clinical work with a group of therapists will be illustrated. Referrals to these consultations are numerous: difficulties during pregnancy, difficulties in feeding of the infant, failure to thrive, excessive irritability in babies… How they are managed will be presented through clinical vignettes and management will be described in the specific care organization of an impoverished Parisian suburb.
GENERAL DISCUSSION

INSTITUTIONS
1. Keele University, Perinatal Psychiatry, Keele, United Kingdom

AUTHORS
1. John Cox¹, Pr, john1.cox@virgin.net,

   In this general discussion we will reflect on the public health policy implications of new data in this field including the evidence, which has led to a new government initiative in the United Kingdom, that supportive interventions during pregnancy in vulnerable families can have beneficial effects on temperament and cognitive ability of the growing child.

   All papers will be discussed in view of the WPA will to disseminate information and promote mental health care in the perinatal field around the world.

AUTHORS
1. Johannes Wancata¹, Prof., MD, johannes.wancata@meduniwien.ac.at
2. Zebulon Taintor², prof., MD, taintz01@med.nyu.edu

   Beside traditional concepts of psychiatric rehabilitation we have learned that neuropsychological functions as well as the patients’ social network are essential for avoiding societal exclusion. This symposium will report research data and show its relevance for everyday clinical practice.
EFFICACY OF THE INTEGRATED NEUROCOGNITIVE THERAPY (INT) FOR SCHIZOPHRENIA PATIENTS: RESULTS OF AN INTERNATIONAL RANDOMISED CONTROLLED MULTI-CENTRE STUDY

INSTITUTIONS
1. University of Bern, Department of Psychiatry, Bern, Switzerland

AUTHORS
1. Volker Rodert1, PhD, roder@spk.unibe.ch
2. Daniele Mueller1, PhD, daniel.mueller@spk.unibe.ch

Objectives: The NIMH MATRICS initiative established a consensus about separate neurocognitive and social cognitive domains relevant in the treatment of schizophrenia: speed of processing, attention/vigilance, verbal and visual learning and memory, reasoning and problem solving, working memory, emotional and social perception, Theory of Mind, social schema and social attribution. We designed a cognitive-behavioural group therapy program (INT) covering these treatment targets. INT is partly computer based and intends to compensate neurocognitive and social cognitive dysfunctions. It puts a strong focus on the patients’ daily life context and facilitates intrinsic motivation and resources.

Methods: INT is evaluated in a multi-centre study in Switzerland, Germany and Austria. INT is compared with treatment as usual (TAU). INT patients receive 30 therapy sessions twice a week, lasting 90 minutes each. A comprehensive assessment battery is applied before and after therapy and at a 1-year follow-up. 130 outpatients participate in the study.

Results: INT patients obtain superior outcomes in neurocognitive and social cognitive variables, negative symptoms, insight and social functioning after therapy and at follow-up compared to TAU. Additionally, only the INT group shows higher correlations between self-rated deficits in neurocognition and objective psychometric test performance after the treatment phase. A SEM model supports evidence of social cognition as a mediating factor between basic neurocognition and functional outcome. Finally, a low drop-out rate of 9% of the INT patients during the study represents a high acceptance by the patients.

Conclusion: Results support the significance of this newly developed integrated therapy program within other rehabilitation approaches.

DIFFERENCES IN STIGMA PERCEPTIONS BETWEEN PATIENTS SUFFERING FROM EPILEPTIC, DISSOCIATIVE OR SOMATOFORM PAIN DISORDER

INSTITUTIONS
1. Medical University of Vienna, Dept. of Psychiatry, Vienna, Austria
2. Medical University of Vienna, Dept. of Neurology, Vienna, Austria

AUTHORS
1. Marion Freidl1, MD, marion.freidl@meduniwien.ac.at

6. Christoph Baumgartner1, Prof., MD, christoph.baumgartner@meduniwien.ac.at
7. Martin Aigner1, Prof., MD, martin.aigner@meduniwien.ac.at

Aim: The aim of this study was to survey the attitudes of 101 patients with epileptic, dissociative or somatoform pain disorders from either the Dept of Psychiatry or Neurology toward anticipated mental illness stigma. According to Link et al’s (1989) “modified labelling theory”, many psychiatric patients believe that “most people” devalue and discriminate against mental patients. These beliefs may have negative consequences for the patient’s self esteem and are also a risk factor for chronification.

Methods: 101 patients (age: 43 [± 11] years; 58 % female) were included. The assessment was based on Link’s Perceived Stigma Questionnaire (1987). The 12-item scale assesses beliefs about the devaluation and discrimination directed toward persons who have mental illness. All data were analysed with SPSS-10 version for Windows.

Results: Nearly 60 % of all 101 patients believe that “most people” would not allow a mental patient “to take care of their children”, would be “reluctant to date a psychiatric patient” and “most employers would pass over” the application of a psychiatric patient. 55 % of the respondents assume that “most people think less of a psychiatric patient” and that the general population thinks that psychiatric patients are “less intelligent, less trustworthy and that their opinion is taken less seriously by others”. Fear of being stigmatized is still more pronounced among somatoform pain patients.

Conclusion: Fear of stigma may cause treatment delay, therefore further psychosocial interventions are necessary to reduce discrimination, especially for patients suffering from pain disorders.
THE NEEDS AND THE DEMANDS FOR INTERVENTIONS OF MOTHERS AND FATHERS OF SCHIZOPHRENIA PATIENTS

7. Andrea Kucera¹, Mrs, kucera.andrea@chello.at

Aim: We planned to investigate the need for interventions among fathers and mothers of patients suffering from schizophrenia or schizo-affective disorders.

Methods: 101 patients suffering from schizophrenia or schizo-affective disorders and their mothers and fathers were investigated. The instruments included the "Carers' Needs Assessment for Schizophrenia" (CNA-S), the "Beck Depression Inventory", the CAGE, the "Involvement Evaluation Questionnaire" as well as the "Family Problem Questionnaire".

Results: Often fathers and mothers spend an equal amount of time caring for the patient. Mothers were more frequently depressed than fathers, and fathers showed more frequently alcohol problems than mothers. Mothers' objective burden was significantly higher than the fathers’ objective burden, but parents did not show differences concerning subjective burden. Despite the fact that mothers often have more problems and need more interventions than fathers, fathers very frequently show problems and need interventions, too. The number of problems and the need for intervention were highest during the first two years of the patient's illness.

Conclusion: This confirms the idea that fathers' as well as mothers' needs must be considered when planning psychiatric services. Our study shows that the traditional concept of "key relatives" should be seen with some caution.

JOINT SYMPOSIUM ON SEVERE PERSONALITY DISORDER (PD & LD)

INSTITUTIONS
1. Imperial College, London, Psychological Medicine, London, United Kingdom
2. Queen Mary's and Westfield College, Forensic Psychiatry, London, United Kingdom
3. Medical Research Council Biostatistics Unit, Institute of Public Health, Cambridge, United Kingdom

AUTHORS
1. Peter Tyrer J Tyrer¹, Professor, p.tyrer@imperial.ac.uk
2. Mike Crawford¹
3. Tony Johnson³, tony.johnson@mrc-bsu.cam.ac.uk
4. Min Yang²
5. Nick Bouras⁴

Context: Severe personality disorder is seldom mentioned in learned journals but is common in lay parlance and policy documents. We argue in this symposium that it can be recorded successfully in research investigations and is highly valuable in both predicting outcome of many common psychiatric disorders and in helping to manage them. We present here a series of papers that demonstrates the value of the term and argue for its adoption in new classifications.

Objectives:
1. To describe the type of problems manifested by those with severe personality disorder in new pilot sites for personality disorder services in England.

Key Messages
2. To describe the epidemiology of severe personality disorder in those of normal intelligence and those with intellectual disability
3. To illustrate the impact of severe personality disorder on the outcome of depressive disorders

Conclusion:
Severe personality disorder is an excellent way of combining dimensional and categorical classification of personality disorders,
SERVICES FOR PATIENTS WITH SEVERE PERSONALITY DISORDER

INSTITUTIONS
1. Imperial College, London, Psychological Medicine, Division of Neuroscience and Mental Health, London, United Kingdom

AUTHORS
1. Mike Crawford, Dr

Background: Little is known about how services for patients with severe personality disorder (PD) should be organised and delivered.

Aims: To identify factors which promote successful engagement and treatment of people with severe PD.

Results: Qualitative data were collected from over 200 service users and providers. Basic demographic and clinical data were collected on over 1,400 people over an 18 month period. Despite marked differences in the structure of the 11 services, service users and providers identified a range of factors which they believed promoted high quality care. These include the need to combine psychological treatments with social interventions and opportunities for peer support. There were however important differences in views about inclusion criteria, and assessment procedures. Quantitative data revealed that people taken on by these services had high levels of personality disturbance and poor social functioning. Services varied in the proportion of they were able to engage (from 31% to 100%). Most people who engaged with services remained in contact with them. Men and those with higher levels of personality disorder were more likely to drop out of contact with them.

Conclusions: These data highlight factors which stakeholders believe constitute high quality care for people with PD. Dedicated services for people with PD need to pay particular attention to supporting clients during assessment and developing more effective ways to engage people with high levels of personality disturbance.

INFLUENCE OF SEVERE PERSONALITY DISORDER ON THE OUTCOME OF TREATMENT OF DEPRESSION

4. Roger Mulder
5. Peter J Tyrer
6. Simone Kool

Background: There continues to be debate about the influence of personality disorder on the outcome of depressive disorders and is relative interactions with treatment.

Aims: To determine whether severe personality disorder has a greater negative impact on the outcome of depression than milder degrees of personality abnormality.

Methods: Systematic electronic search of Medline, Clinhal and Psychinfo from 1966, 1982 and 1882 respectively until February 2007 was undertaken. Those papers in which severity of personality disorder was able to be recorded were included in the review.

Results: Data was synthesised using the Cochrane RevMan 4.2 programme. The comparative odds of severe compared with other levels of co-morbid personality pathology will be compared with those with no personality disorder.

Conclusions: These will be dependent on the results presented.
THE EPIDEMIOLOGY OF SEVERE PERSONALITY DISORDER

INSTITUTIONS
1. Queen Mary’s and Westfield College, Forensic, United Kingdom
2. Imperial College, London, Psychological Medicine, Division of Neuroscience and Mental Health, London, United Kingdom

AUTHORS
1. Min Yang
2. Peter J Tyrer

Background: Severe personality disorder, according to the criteria of Tyer & Johnson (1996), has the potential to be recorded in all epidemiological surveys.

Aims: To reexamine the personality data from the British National Survey of Psychiatric Morbidity in which 8886 randomly selected adults completed a first-phase interview, a response rate of 69.5%.

Methods: Reanalysis of data presented previously in categorical and cluster format (Coid et al, 2006) but using the data obtained using the screening interview of the Structured Clinical Interview for DSM-II (First et al, 1997) and using the Tyer & Johnson method to record severity of personality disturbance.

Results: Not yet fully known. Preliminary results suggest that complex personality disorder (a lower level of severity) is present in 1.4% of the population and severe personality disorder in about one tenth of these, and that these are associated with major societal handicaps.

Conclusions: To be formulated later.

SEVERE PERSONALITY DISORDER IN ADULTS WITH INTELLECTUAL DISABILITY

INSTITUTIONS
1. King’s College London - Institute of Psychiatry, London, United Kingdom

AUTHORS
1. Nick Bouras

Background
The diagnosis of severe personality disorder in people with intellectual disability is important for clinical decision management. However, its prevalence in a clinic population of people with intellectual disability remains uncertain.

Aims
This study was designed to explore the prevalence of the primary diagnosis of personality disorder in a large sample (N = 806) of adults with intellectual disability referred to specialist mental health services in South East London.

Method
The eligibility criteria for the study were identical with the referral criteria, i.e. an ICD-10 diagnosis of mental retardation (F70-73) and significant social impairment. Participants were between the ages of 16 and 86 years of whom 60% were male. Behavioural problems, as well clinical and socio-demographic characteristics, were examined in relation to clinical decision management. Two experienced psychiatrist agreed on the diagnosis by using ICD-10 clinical criteria.

Results
Data will be presented on the clinical characteristics including behavioural problems in those diagnosed with personality disorder and intellectual disability.

Conclusions
The data will inform on the service implications for people with intellectual disability who have personality disorder including those with severe personality disorder.
Phenomenological investigations of psychotic states of mind have changed our understanding of psychosis in the last hundred years. Starting with the early work by Karl Jaspers many psychiatrists like Wolfgang Blankenburg, Bin Kimura or Louis Sass drew on the phenomenological method in order to reach a more profound understanding of delusional realities, psychotic states of mind and schizophrenic experiences. While Jaspers claimed incomprehensibility as a paradigm for schizophrenic experiences, more recent investigations addressed this aspect in a new and challenging way. Furthermore these investigations showed the importance of other aspects like the difficulties for co-creating personal relationships, the loss of common sense or the taken for granted reality and the need for hyperreflectivity when striving for an understanding of the schizophrenic experiences. In this symposium we want to reflect on this tradition and show the possibilities and the problems for understanding psychotic experiences in a phenomenological way.

FROM A PARADIGM TO A MESSAGE: INCOMPREHENSIBILITY IN A PHENOMENOLOGICAL UNDERSTANDING OF PSYCHOSIS

In 1913 Jaspers named incomprehensibility as the main qualitative characteristic of the schizophrenic experience. This paradigm was partially the result of his method, understanding incomprehensibility as the failing to comprehend the experiences of others thoroughly. Jaspers did not intend any disrespect and he assumed that the psychiatrist attempted to understand his patient, but there are at least two important assumptions in this paradigm that are open to discussion:

1. it is someone else who defines if somebody’s experience is comprehensive or incomplete
2. comprehensibility is meant as a reflective and explicit understanding.

On a hermeneutical level we can argue that the understanding of an experience is always open for improvement - meaning self-understanding as well as understanding of others. A more profound phenomenological critique of this paradigm points out that the pre-reflective basis has to be taken into account. In the schizophrenic experience many “taken-for-granted” aspects of our normal experiences are suspended. As Erich Wulff proposed, the incomprehensibility, as often prominent for the schizophrenic person in his experience, points to a primary givenness implicit in all that is given. This immediate, undeniable and nonobjectifying givenness - that we are given alive and as we are in our world - will not find an exhaustive description even for a phenomenological approach (Zahavi). Incomprehensibility of oneself or others can therefore be understood as a message that “life itself” is giving us. One important implication is the necessity for ongoing self-critique of an exaggerated confidence in our psychiatric knowledge.
DELUSIONS: A FROZEN REALITY

INSTITUTIONS
1. Anton Proksch Institute, Vienna, Austria

AUTHORS
1. Michael Musalek, Prof., MD, michael.musalek@univie.ac.at

We all live in a world of allegories and metaphors. As cosmopoets we all create our world of symbols and images. One of the major metaphors in psychiatry are its diagnostic categories, definitions of mental disorders resulting in classification systems and complex scientific explanations with all their meanings for patients and therapies. In this way delusions represent as a result of our cosmopoetic work such allegories in a double meaning: the delusional ideas and their meanings are not only creations of the patients, but also those of the therapists. Giving a natural phenomenon "professional meaning" by our diagnostic procedures (definitions, descriptions of psychopathological phenomena, diagnostic attributions, etc.), diagnoses take meanings which go far beyond the primary meaning of pure psychopathological definitions. It is the intention of this contribution to go into the matter whether the image of freezing - or better: of being frozen - fits more with the world of ideas and perceptions of deluded patients then current metaphors as for example the view that delusions as "false beliefs" represent the embodiment of a meaningless and senseless existence ("Sinnentleerheit des Daseins" = "Wahnsinn"). As the various meanings of delusions may also act as disorder maintaining factors in the pathogenesis of delusions and therefore provide the diagnostic basis of effective treatment planning, considerations on metaphors and allegories in delusional research are not only of theoretical psychopathological interest but also of utmost practical importance.

DEATH, SUICIDE AND PSYCHOSIS

INSTITUTIONS
1. University of Ljubljana, Psychiatry and Psychotherapy, Slovenia

AUTHORS
1. Borut Škodlar, Mr, MD, skodlar@psih-klinika.si

In psychosis, this most overtly exotic of psychopathological processes, death constitutes one of the major sources of anxiety. According to Searles, the inevitability of death lies at the very heart of the schizophrenic world.

Suicidal ideation and behaviour form another major constituent of the lived world of psychosis. Not so much delusions, hallucinations or any other extraordinary experiences, not even the anxiety and horror of acute psychosis, but more the silent, gradual and constantly present dimensions of the psychotic world lead a patient towards suicidality. These hidden, but deeply painful dimensions are: the patient's inability to participate in human interactions, solitude, feelings of inferiority, guilt and abortiveness, among others.

So death, be it with its universal anxiety-provoking presence or in the form of a "promised land", walks with almost every step of a psychotic patient. The existential-phenomenological tradition in psychiatry has made us more aware to have an ear to listen for this theme and a tongue to pass the bottleneck of expressing it linguistically. Having these enhanced senses crucially aid a therapist in opening up new ways of establishing or strengthening the therapeutic relationship with a psychotic patient.
LOSS OF COMMON SENSE: PHENOMENOLOGY AND SCHIZOPHRENIA

INSTITUTIONS
1. Hannover Medical School, Germany

AUTHORS
1. Erich Wulff, Prof. Dr.

Wolfgang Blankenburg developed in his important phenomenological approach to schizophrenia the concept of "loss of natural evidence" as an important concept for understanding the trouble generator of schizophrenia. Many persons suffering from schizophrenia experience this as the bottom and final reason of their helplessness and their failing intentional orientation in their world. In some passages of his work Blankenburg talks about the "loss of common sense" and on first sight it seems to be used simply as another word for the "loss of natural evidence". Yet this does not seem to be true. Drawing on the analysis of confidence as put forth by Ludwig Wittgenstein, this paper shows the differences as well as the similarities and overlapping of the two different concepts "common sense" and "natural evidence".

FIBROMYALGIA FROM COMPLAINTS TO EVIDENCE

INSTITUTIONS
1. Brazilian Brain Institute, Rio de Janeiro, Brazil

AUTHORS
1. Jorge Alberto Costa e Silva, Dr., MD, jacs@vetor.com.br

Fibromyalgia (FIBROMYALGIA) is a clinical entity of unknown cause characterized by chronic diffused pain referred to the soft musculoskeletal tissues. Patients with FIBROMYALGIA also have allodynia, fatigue, sleep disorders, cognitive disturbances, psychological distress and headache. Important doubts subsist on the pathophysiological mechanisms of this disorder. Fibromyalgia is highly prevalent in adults (2 to 13% of general population), females being five to nine times more affected than males, and constitutes a serious public health problem and major social economical burden. Subjective complaints are largely predominant and as a consequence FIBROMYALGIA diagnosis is essentially clinical. Complementary diagnosis tests are normal or negative. The absence of objective signs allied with the psychological need of organicity typical from today's medicine practice, turns FIBROMYALGIA existence controversial. Fibromyalgia is one of several causes of widespread chronic pain and probably is the end of a pain and tenderness continuum.
PATHOGENESIS OF FIBROMYALGIA

INSTITUTIONS
1. New York University, Medical Center, New York, United States

AUTHORS
1. Robert Cancro, Dr., MD, Robert.Cancro@nyumc.org

The precise pathogenesis of Fibromyalgia remains unknown. Hypotheses include somatization and altered pain perception (central sensitization). There are links between fibromyalgia and psychiatric disorders, although these are not straightforward. Fibromyalgia, like other pain conditions, is associated with depression. Likewise, muscle pain and poor sleep, key features of fibromyalgia, are increased in patients with depression. Community and longitudinal studies show overlaps between risk factors for psychiatric disorders and those for depression. Furthermore, fibromyalgia overlaps with other symptom defined conditions such as chronic fatigue syndrome, irritable bowel syndrome and others.

Numerous studies have demonstrated altered pain perception and central sensitization in Fibromyalgia. Patients experience pain at a lower nociceptive threshold than normal individuals. There are also suggestions that local pain may "spread" and become generalized in susceptible individuals.

TREATMENT OF FIBROMYALGIA

INSTITUTIONS
1. Sta. Casa de Misericórdia do RJ, Dept. of Psychiatry, Rio de Janeiro, Brazil

AUTHORS
1. Vera Lemgruber, Dr., MD, vera@veralemgruber.com.br

It is not currently possible to retain one particular technique of evaluation, which can be said to be the "gold-standard" for fibromyalgia. The optional measure remains yet to be defined and will probably vary according to the patient, and therefore have to be adapted depending upon the individual case. It is also not yet possible to define the changes considered as clinically pertinent to affirm whether a treatment is efficient or not. And finally, what seems to be the most important, is the patients’ and their doctors’ opinion of this dual approach, where the non-medical and the environmental factors are of a major importance. One should aim towards a composite index generated by the patients themselves, integrating not only the symptoms suffered by the patient but also how fibromyalgia affects his or her everyday life. In this context a new International Classification of Diseases (ICD), based upon the occupation, the activities and the environmental factors, is in the process of being developed and seems to be of interest: it allows for the integration of a bio-psycho-social model which is particularly pertinent to fibromyalgia. This classification should allow one to compare the different therapeutic approaches to this syndrome in various countries and also to compare fibromyalgia and its treatment to other chronic diseases.
EPIDEMIOLOGY OF FIBROMYALGIA

INSTITUTIONS
1. University of Lisbon, Dept. of Psychiatry, Lisbon, Portugal

AUTHORS
1. Jaime Branco, Dr., MD, jaimeb.med2@fcm.unl.pt

As currently defined, fibromyalgia is not an uncommon disorder. The prevalence rate varies from 2% to 13% depending on the population studied and the definition used. It affects women more frequently than men with a ratio of 3:1. Whilst it is predominantly an illness of mid life, all ages including children can be affected, but it is very rare and perhaps should not be diagnosed before puberty. Complete remission in Fibromyalgia is rare and healthcare utilization in Fibromyalgia patients is high. The chief Medical Officer in the UK, Professor Liam Donaldson wrote recently to all UK doctors highlighting the healthcare burden of chronic widespread pain and fibromyalgia and the need for more information for doctors and patients. It is also important to recall that all the symptoms that make up the fibromyalgia complex are dimensionally distributed in the community. Hence any prevalence or epidemiological data on Fibromyalgia alone runs the risk of imposing an arbitrary cut off on what is a dimensional process, but the exact choice of cutoff between, say, mild and moderate hypertension, is arbitrary.

4. Florence Quartier¹, Dr, florence.quartier@worldcom.ch

The future of psychiatry seems to be closed off to many psychiatrists practising today: the rise in specialisation backed up by different theories, the lack of sufficient means, the explosion of the number of practices, the increase in demands which are too diverse; all this results in dizziness, immobility and sometimes discouragement. We put the case here for an opening to clinical practice: - which places or replaces the patient and his family at the centre; - which combines psychiatry and psychotherapy leaving the patient’s own words inspired by his particular history to speak for themselves; see Intervention D. Trojan et F. Ansermet; - which is specifically psychiatric through its ability to use clearly-defined inputs from different fields of knowledge, the economy to demography by way of neurobiology and psychoanalysis, without losing sight of what has already been achieved. Today we can redefine delicate and relevant clinical practice so as to tackle the most diverse psychopathological challenges. See Intervention Dr. Fl. Quartier

The future of psychiatry seems to be assured on condition that all those involved can clearly (freely?) define their choices, set out their theoretical options, choose their methodology and employ it with care. See Intervention P. Giannakopoulos

This workshop is organized by the WPA Section “Psychoanalysis in Psychiatry”.

Psychoanalysis and Public Psychiatry: An Innovative Project

Institutions
1. University Hospital Geneva, Psychiatry, Geneva, Switzerland

Authors
1. François Ansermet¹, Dr. Professor, francois.ansermet@hcuge.ch
2. Dante Trojan¹, Dr, dante.trojan@mac.com

The place of psychoanalysis in the field of public psychiatry is a central debate both in the Psychoanalytical Societies and in the public psychiatric institutions. The myth of transparency seems to dominate society and to influence its thought. This has resulted in an absolute shift in the place of psychoanalysis during these last decades. New technologies of investigation, discoveries in neurosciences and new pharmacological therapies also open new perspectives. In such context, what role can psychoanalysis still play? In our opinion, an essential part in preserving the quality of care in public health. The Service of child and adolescent psychiatry of Geneva will open a Clinic of Psychoanalytic Treatments in a very near future. This outpatient clinic will cater to a population of any age, from the newborn to the adult and elderly person. It will offer a space for the practice of psychoanalysis, for the various forms of psychoanalytical treatment and care.

The training of the analysts will remain the competence of the Societies to which they are affiliated. The debate between psychoanalysts of different schools, as well as with all the actors in the public service, will allow for very precious openings. A psychoanalysis that remains alive in the institutions, which articulates itself with university education and opens up to the city, which dialogs with sciences, benefits from a “psychical growth”, undoubtedly analog to the one that takes place in the analytical cure. We wish to open the dialogue with the participants about this innovative project.

Training Program: Opening to the Future

Institutions
1. University Hospital Geneva, Psychiatry, Geneva, Switzerland

Authors
1. Florence Quartier¹, Dr., florence.quartier@worldcom.ch

At present profound changes are affecting all those intervening in psychiatry, sometimes at the very heart of their professional identity. Let’s discuss it. In our presentation we will start from a “Swiss made” experience based on a training program that links psychiatry and psychotherapy. Part of this program brings together psychiatry and psychoanalysis in a contemporary manner. This approach is promising:
- when it increases the efficiency of the clinical interview. This applies to all patients, whatever their age and the seriousness of their condition. We will give some brief examples taken from daily practice.
- when it renders attractive the training programs aimed at psychiatrists as well as to all those intervening in psychiatry. We will give some examples of seminars for general practitioners or prison personnel.

POSTGRADUATE TRAINING IN OLD AGE PSYCHIATRY: TOWARDS A NEW PARADIGM OF COMPLEXITY?

INSTITUTIONS
1. University Hospital Geneva, Psychiatry, Geneva, Switzerland

AUTHORS
1. Panteleimon Giannakopoulos¹, Dr., Professor, Panteleimon.Giannakopoulos@hcuge.ch

Two years ago, the federal authorities accepted the creation of a board certification in old age psychiatry and psychotherapy corresponding to a 2-year intensive training. Each candidate should have solid basic knowledge of psychopathology and clinical neurosciences. To avoid a too rapid over-specialization in old age psychiatry, the candidate should first obtain his certification on general adult psychiatry and psychotherapy. Clinical stage in old age psychiatry includes a 1-year obligatory stage in out-patient services pointing to the increasing need for community-based care for this age group. After completing a full psychotherapeutic training in adult psychiatry, and during the 2-year supplementary training in old age psychiatry, the candidate is exposed to a series of theoretical courses focusing on the main psychotherapeutic schools for the elderly. He must attest of at least 40 hours of individual supervisions corresponding to at least 80 hours of psychotherapeutic work. Finally, the candidate has the opportunity to assist in several courses on biology, sociology and medical ethics related to the aging processes. The long-term process leading to the construction of a clear psychiatric and psychotherapeutic identity for old age specialists contrasts with the well-known tendency to decrease the years of postgraduate training in Europe. This presentation will address the medicoeconomical and social aspects of this choice and discuss the advantages and weaknesses of the Swiss model of training in old age psychiatry and psychotherapy.

Using situations taken from our daily practice, we would like to offer the results of the reflections on adult and psychogeriatric psychiatry which emanated from a working party of psychiatrists trained in the French and Swiss systems and working in the private and public sectors. This situation forces us to define our own identity, to question the nature of our function and to link theory and practice as closely as possible during the course of every interview. Such an ethical challenge is of the utmost importance for the future. This workshop is organised by the Section “Psychoanalysis in Psychiatry”

ETHICS: FAMILIES AND INSTITUTION

INSTITUTIONS
1. German Academy for Psychoanalysis, Psychoanalysis, Munich, Germany

AUTHORS
1. Margit Schmolke¹, Training analyst, margitschmolke@aol.com

In adult psychiatry and specially in psychogeriatrics, the request for assistance often comes from the families, an institution or other organization. It is raised the question, whose benefit the elderly person should be treated for?
Between a prescriptive demand, the lack of understanding of one or all for sometimes severe symptoms, the physician such as many other care providers pay particular attention to give his place to the elderly person and to flush out his suffering, such as helping the families to understand.

Currently exposed to heavy pressure from society, the care to the elderly person functions as a barometer for assessing the ethics of all those who work in the field of health.
About clinical examples derived from daily practice, we suggest a reflection arisen from working group in which members are healthcare professionals trained in France and Switzerland and practising in the public or private sector.
In this workshop we wish to engage in discussion with the participants.

PSYCHIATRY IN THE ELDERLY: A BAROMETER FOR THE ETHICS

Why and to what end is an adult patient to be treated? Psychiatrists (and other psychiatric personnel) find themselves caught between the demands of a normative order, i.e. society’s lack of understanding of unusual behaviour and the patients’ difficulty in seeing themselves as individuals in their own right. This situation forces us to define our own identity, to question the nature of our function and to link theory and practice as closely as possible during the course of every interview.

Such an ethical challenge is of the utmost importance for the future of psychiatry.

About clinical examples derived from daily practice, we suggest a reflection arisen from working group in which members are healthcare professionals trained in France and in Switzerland and practising in the public or private sector.

Rupture, inconsistency, disappearance of strong reference points, these are the dangers which lie in wait for the psychiatrist. We need to specify on what theoretical bases we want to work. We need to stay alert to maintaining a certain consistency that the patient and his circle can identify as interesting and useful for an improvement. We will see how, during long and difficult treatments we create a dynamic with the multidisciplinary teams through meticulous work at the interview, walking a fine line between biology and relationship. Psychoanalysis today can contribute to a consistency in psychiatric treatment as long as it is used in a contemporary manner. The watchword is consistency.

At different times, all the participants at this workshop take on institutional responsibilities, keeping in direct contact with the daily routine. We will stay with this routine, that which has been developed over many years in most out-patient centres. We will pass from the detailed multidisciplinary work to the interview which is the principal pivot in a psychiatric treatment.

With the exception of certain limited domains, psychiatry can’t be reduced to guidelines and we hope that through our brainstorming new ideas can come to the fore giving us a certain impetus to carry on our work which can at times be difficult and fascinating. This is why we want this workshop to be interactive to encourage as broad a discussion as possible. This Workshop is organized by the WPA Section “Psychoanalysis in Psychiatry”
MEDICAL PRESCRIPTION IN PSYCHIATRY AND ITS TRANSFERENTIAL STAKES

INSTITUTIONS
1. UNIVERSITY HOSPITAL OF GENEVA, PSYCHIATRY, GENEVA, Switzerland

AUTHORS
1. JAVIER BARTOLOMEI1, Dr., MD, bartolo72@hotmail.com

In psychiatry, medical prescription is particularly complex, involving at the same time neurobiology and transference. It obliges us to have an objective view of the situation and to include ourselves as psychotherapists. An interrupted treatment worsens the symptoms and can imply a positive idealizing transferential movement. An annoying secondary effect can raise a negative transferential movement. The case report we would like to discuss shows us how complexly the biological effects of a treatment can combine themselves with transferential fluctuations and how a psychiatric intervention can enhance the psychotherapeutic process and vice versa.

MULTIDISCIPLINARY WORK WITH PSYCHOTICS PATIENTS

In this symposium we will describe four different aspects of clinical research and observations in clinical settings in the perinatal mental health French public system. Longitudinal observations of infants of mentally ill parents, clinical research with visually handicapped mothers and their very young infants, and both clinical research of vocal interactions and therapeutic management of infants and their mothers with Personality disorders will be shown. Each of these different aspects of the impact of maternal difficulties on the infant and mother-infant development will be put into perspective. The scientific literature will be reviewed on each of these specific subjects. The manner in which each of these particular aspects of infant and perinatal mental health may serve to understand the management of mental health care in the perinatal field will be highlighted.

Borderline personality disorder is a common psychiatric issue active during the childbearing years. This relationship-centered disorder is therefore put to test when motherhood appears. The specificity of mother-infant interactive patterns at three months have been studied in our research unit while these mothers were offered therapeutic programs in our clinical setting. We will show video clips illustrating the specificity of these early set patterns. The possible meaning for the infant of these maternal initiated interactions will be discussed in the light of developmental and clinical research. The specific therapeutic aspects of the clinical management of the mother and infant dyads and their follow-up at one year will be presented.
MENTAL HEALTH MANAGEMENT AND CARE FOR VISUALLY HANDICAPPED MOTHERS DURING THE PERIPARTUM

INSTITUTIONS

For many years visually handicapped women have been negatively considered when accessing parenthood. Care was sparse and judgemental. The transition to motherhood for these women was in itself a major and difficult developmental change. The right to become mothers and care for an infant was not always considered positively both by the future mother and by her environment.

In this paper clinical care and follow-up of 40 visually handicapped mothers will be presented. How specific management was implemented and adapted both to the specific problems of loss of sight and other mental health issues such as postnatal depression will be described. How to implement long-term prevention and care will be discussed.

TURN-TAKING AND PROSODIC MATCHING IN VOCAL INTERACTIONS BETWEEN 3-MONTH-OLDS AND THEIR BORDERLINE MOTHERS

From around the second month of life infants are known to engage in prolonged playful conversational exchanges, using variable acoustical dimensions such as pitch, intensity and timbre to modulate their vocal utterances. Our study of vocal engagement between 3-month-old infants and their mothers with borderline personality disorder is based on an analysis of types of vocal utterance according to the parameters of contour, pitch, intensity and velocity, and their temporal organisation. The first aim of the study was to evaluate the amount and degree of vocal matching between ‘borderline’ mothers and their infants as compared with ‘unaffected’ mothers and their infants. The second aim of the study was to explore a possible link between the amount of vocal matching and the length of turn-taking sequences between mothers and infants. Audio recordings of mother-infant interaction were taken from a large data sample collected for a longitudinal study of mothers with personality disorder and their infants, carried out at a clinical research laboratory in France (PI : Dr. Apter-Danon). In this study, we compare a clinical sample of 15 mothers with borderline personality disorder and their infants with a control sample of 15 unaffected mothers and their infants. Two minutes of vocal interaction were selected for analysis. Analyses were performed using an acoustic analysis method providing measures of prosodic matching based on pitch contour, mean pitch, mean intensity and velocity, as well as durations and types of turn-taking sequences. Our findings show that the vocal utterances of ‘borderline’ mothers and their infants are less well matched on most dimensions related to prosody and that their turn-taking sequences are shorter than those of control mothers and infants.
THE PRIMITIVE SUFFERINGS IN THE MOTHER-BABY DYAD. RESEARCH IN A COMMUNITY OF A WELL-BABY CLINIC

INSTITUTIONS
1. University Lyon 2, Psychology, Lyon, France
2. Le Vinatier Hospital, Child Psychiatry, Lyon, France

AUTHORS
1. Denis Mellier¹, Mr, PhD;HDR, gisdanap@aol.com
2. Joelle Rochette², Dr, MD, gisdanap@aol.com

Trauma is not easy to detect in early infancy except when pain and defense mechanisms are so intense that psychopathology is diagnosed. Before this extreme level is reached, we believe that there are many micro-traumatic manifestations in the mother-infant dyad. We will underline the role of the primitive anxieties that indicate the eventual existence of traumatism (Bick, Fraiberg) that are diffused in a whole intersubjective context. It is particularly pertinent to observe these mechanisms during the post-partum.

Our research studies the efficiency of a network between Well-Baby clinic and Perinatal Psychiatry. The signs of sufferings of 52 dyads attending a community ‘well-baby clinic’ are assessed in the immediate post-partum, at 3 months, 6 months and one year with a double methodology, clinical (inspired from infant observation according to Bick and discussion) and scaled with standardized instruments - ADBB (A. Guedeney) for the baby, EPDS (J. Cox) for mother and PIPE (B. Fiese) for the interaction.

The results show the complexity of how to evaluate early distortions, the numerous meanings and the instability of their expressions, the variability of the moment of their manifestations during the first year. Efficacious management depends on network facilities that allow interventions in primary, secondary prevention and then in a psychotherapy engagement.

4. Riyadh Al Baldawi⁴, Dr., MD, r.baldawi@orienthalsan.nu

Immigration no longer concerns singular nations strictly. It has now become a concern at the European level. This symposium proposes a comparative approach to current mental healthcare practices, so as to tease out a common strategy which seeks to improve therapy for migrants and refugees, by means of looking for commonalities between different European institutions. Confronting our respective therapeutic practices and diagnoses will in effect allow for a new impetus to cultural competence, which has become necessary for all therapists at the European level.
AVOIDING THE STIGMATIZATION OF THE PATIENT OR THE THERAPIST: THE CLINICAL MEDICAL ANTHROPOLOGY APPROACH

INSTITUTIONS
1. Centre Minkowska, France

AUTHORS
1. Rachid Bennegadi, Dr., MD, bennegadi@minkowska.com

The author presents a clinical case in which the stigmatisation of the patient is induced by therapeutic references limited to culture-bound explanations, and in which the therapist -- whatever his theoretical orientations and his clinical experience -- finds himself caught in a mirror stigmatisation. How to avoid such situation at the same time as enabling oneself to accommodate the patient’s needs? This is what this presentation will discuss.

MOROCCAN WOMEN IN PSYCHOTHERAPY

INSTITUTIONS
1. Centrum 45 - Noordwijkerhout, The Netherlands

AUTHORS
1. Hans Rohlof, Dr., MD, h.rohlof@centrum45.nl

Moroccan individuals are one of the three largest non Western population groups in the Netherlands: their total number is 332,000, of which 172,000 are males, and 160,000 females. In the latest years they have a growing demand for psychiatric treatment: the taboo of this kind of treatment seems to be finished.

Moroccan women in the Western society are tiered apart by very different cultures. On one side, there is the Western culture with all its opportunities. On the other side, there is the traditional culture, where women play an important role in the family.

In psychotherapy with Moroccan women the therapist should be aware of all the dilemmas Moroccan women encounter. He or she should be culturally competent, but also have understanding for individual choices patients make. Next to this, the therapist should be aware of his own norms and values.

Case material with Moroccan women will illustrate these findings.

Objective:
To know more about the different choices in live migrants have to make.

To improve his or her own therapeutic skills with non Western women.
THE MIGRATORY STRESS AND GRIEF ASSESSMENT SCALE

INSTITUTIONS
1. S.A.P.I.R. Barcelona, Spain

AUTHORS
1. Joseba Achotegui

The migratory stress and grief assessment scale is based in psychoanalytical and cognitive approaches and is characterized by:
1. The grouping of migratory stress factors into seven types of grief: family, language, culture, earth, social status, group of belonging, physical risks.
2. The classification of these types of grief into simple, complicated, and extreme depending on their difficulty.
3. The assessment of subject migratory vulnerability, the intensity of stress migratory factors.

The scale integrates the analysis of the elements 1, 2, and 3. Symptoms would be an element associated to these situations that may be correlated with the scale.

INTEGRATION AND ACCULTURATION IN THE CONTEXT OF MIGRATION RELATED STRESS

INSTITUTIONS
1. Orient Medical and Rehabilitation Centre Stockholm, Sweden

AUTHORS
1. Riyadh Al Baldawi

Integration and acculturation are two processes that individuals who migrate to a new country have to go through. These processes create stress and other challenges for the individuals to overcome in order to stabilize a functional life in the host country. Success in these processes depends on several factors interacting with each other, including the individual’s resources, flexibility, and willingness to change and the individual’s social network in the new society as well as the receiving country’s level of encountering and socioeconomic preparedness. The interplay between all of these factors has to be taken into consideration in order to avoid the failure of integration with following social problems.

This presentation is based on extensive clinical experiences on working with immigrants from different parts of the world migrating to Sweden. The relation between migration related stress (MRS) and the way the immigrant deals with it is described in a theoretical way. Most immigrants succeed in their integration process by adopting a functional scheme to overcome the stress and social challenges they encountered on their way, while others failed by using a dysfunctional scheme.

5. Anita Riecher-Roessler, Prof. Dr., ariecher@uhbs.ch

Objective: Violence against women is a major risk factor for the mental health of women all over the world. It can occur in many different forms, e.g. partner or domestic violence, sexual violence, violence in times of war or within harmful traditional practices or as trafficking of women for the sex trade. Interventions on an individual and clinical level as well as on a more global, political level are urgently needed. The scope of the problem and potential interventions will be discussed in this symposium.

RESPONSE TO GENDER BASED VIOLENCE IN LATIN AMERICAN HEALTH SECTOR: INCOMPLETE, FRAGMENTARY BUT BRAVE

INSTITUTIONS
1. Universidad Peruana Cayetano Heredia, Colegio Médico del Perú, Lima, Peru

AUTHORS
1. Marta Rondon, Mrs., MD, mbrondon@gmail.com

As violence against the woman is a complex multifactorial problem, the responses to it have to be systemic and multidisciplinary. The health system, particularly mental health, should play an important role in responding to violence. The aim of this review of the literature is to establish the extent and quality of state, NGO and private health providers to the needs of women subject to gender biased violence and to evaluate whether these responses keep up with legislative changes in the region. Method: A search of relevant state and regional laws and documents, such as practice guidelines and protocols emanating from Health Ministries (or equivalent) was performed. Results: Normative changes in the health sector lag behind legislative and law enforcement response to GBV. In spite of the fact that women would prefer to receive help and respite from their primary health providers, police are better trained and legislative changes have not been completely implemented in health establishments. Conclusions: A major change in attitudes is needed in authorities and providers for the health sector to adequately respond to the needs of women in this region.

GENDER BASED VIOLENCE IN WOMEN IN THE MIDDLE EAST: INTERVENTIONS AND PREVENTION? A REVIEW

INSTITUTIONS
1. The Lebanese Hospital - Geitawi, Psychiatry Department, Beirut, Lebanon

AUTHORS
1. Josyan Madi-skaff, Mrs., MD, josyan.madiskaff@gmail.com

Throughout the Middle East, the human rights of women are systematically denied in each of the countries in the region, despite the diversity of their political systems: this state of unequal legal rights associated with the multiplication of armed conflicts have led to the increase of Women’s vulnerability to violence.

This presentation will review the available data on Gender based Violence (GbV) as experienced by girls and women in the Middle East region: it will include domestic violence, sexual violence, violence in times of war and harmful traditional practices such as female genital mutilation.

It will review the availability and implementation of the interventions designed to address and prevent the physical, mental and reproductive health consequences of Gender Based Violence on Women in the Middle East.

VIOLENCE AND MENTAL HEALTH IN COLOMBIA

INSTITUTIONS
1. CES University, Department of psychiatry, Medellin, Colombia

AUTHORS
1. Silvia Lucia Gaviria, Mrs., MD, sgaviria1@une.net.co

Objective:
The objective of this review is to examine the real conditions of violence in Colombia and its impact in the mental health of Colombian people.

Method:
A review was undertaken of relevant articles. It was necessary to consult some government statistics about violence in Colombia and some reports of international agencies which work with Human Rights.

Conclusions:
The early part of the decade of the 90’s was remarkable as a period characterized by a dramatic increase in the magnitude of violence, and the problems related to it, in Colombia. At the same time, there has been an increasing recognition, by very diverse voices, concerning the links between violence and mental health. They’re talking about the emotional impacts, the potential harmful effects on children, the seeming impossibility of change, the characteristics of those who are perpetrating the violence...and therefore they’re demanding answers and intervention from those who provide mental health care to these rural areas. Consequently there has been progress in the understanding and identifying both successes and failures, with valuable results for the specialty, such as a body of organized disciplinary knowledge, and as advisors in the pedagogical task, research and assistance revolving around the mental health of Colombians.

TRAFFICKING OF WOMEN FOR THE SEX TRADE

INSTITUTIONS
1. University Health Network, Women's Health Program, Toronto, Canada

AUTHORS
1. Donna Stewart¹, Mrs., MD, Dr.Donna.Stewart@uhn.on.ca

Objectives: To provide information on trafficking of women for the sex trade, health risks, suggested policies and clinical practices for prevention and amelioration.

Methods: A systematic literature review was conducted, key stakeholders interviewed.

Results: Trafficking of women is an international social, ethical and health challenge. The UN Protocol to Prevent, Suppress and Punish Trafficking in Persons defines trafficking as "the recruitment or transportation of persons by means of threat or other forms of coercion for the purpose of exploitation, (incl. sexual exploitation, forced labor or services, practices similar to slavery, servitude or the removal of organs)".

Approx. 1 million individuals worldwide are trafficked annually. 80% are females trafficked for sexual exploitation. Most of these females originate in poor countries where they may be recruited, or sold to agents who often have links to organized crime. Some women/families know their ultimate employment as sex workers, others may be recruited falsely as “waitresses, entertainers or homemakers”. Having arrived in the destination country, their passports are confiscated until their grossly inflated “travel debt” is repaid. They work in dreadful conditions, suffer serious physical and mental health problems. Prevention and best psychiatric practices will be described.

Conclusions: Systematic monitoring and enforcement of agreed upon standards require implementation. Mental Health services for this population need to be improved.

SCREENING FOR PARTNER VIOLENCE AGAINST WOMEN

INSTITUTIONS
1. University Hospital Basel, Psychiatric Outpatient Department, Basel, Switzerland

AUTHORS
1. Anita Riecher-Roessler¹, Mrs., MD, ariecher@uhbs.ch
2. E. Nyberg¹

Background: Partner violence against women is a frequent problem all over the world. However, women often do not seek help and even in health settings the problem is often not recognized, although it can have devastating consequences for the physical and mental health of women.

Aims: We have therefore validated a short screening instrument for partner violence.

Methods: "Partner Violence Screen" (PVS) (Feldhaus et al. 1997) was translated into German, modified and validated. Also a lifetime version was developed. The interview was conducted by specifically trained psychiatric nurses with 112 female inpatients of a crisis intervention ward and compared to the 30 item self rating scale "Index of Spouse Abuse" (ISA) (Hudson + McIntosh 1981). The screening instrument was well accepted by the women. It showed a sensitivity of 0.80 and a specificity of 0.78 for partner violence as compared a sensitivity of 0.79 and a specificity 0.70 of the original version.

Conclusion: This screening instrument proved to be helpful for identifying partner violence. It can be accompanied with women in different health settings within very short time by trained nurses. Translation into other languages and a wide distribution in different health settings would allow the early recognition of partner violence in future.

Section on Women's Mental Health

Conventional gender analysis has identified certain areas which account for much of the inequality between men and women: their contributions, their conditions of work and life (measured by the access to resources and benefits), their different needs and their specific constraints and opportunities. In this symposium Unaiza Niaz, Marta Rondon, Saida Douki and Vivianne Kovess will examine how women's contribution in household tasks and reproductive roles, the limited access to capital, education, health care and employment and their lack of power to control labor conditions, as well as their needs for flexibility in hours during reproductive years, and for protection from harassment and other forms of violence at work contribute to gender inequality, which manifests, in mental health, as a higher prevalence of depressive and anxious symptoms in women. We will also address the importance of social, religious and familial constraints further burden the working woman and we will argue, using data from developing countries, that decent work -as defined by ILO- is a must to insure that work is a source of self esteem, confidence and empowerment for women, and thus, protective of their mental health.

WORK AS AN IMPORTANT STRESSOR FOR WOMEN IN LATIN AMERICA

INSTITUTIONS
1. WPA Section on Women's Mental Health, Peru

AUTHORS
1. Marta Rondon

Access to work and its benefits is supposed to increase self esteem and to strengthen self confidence, to provide a source of positive identity and to empower women allowing them to contribute with the household finances and gain status. Economic adjustment plans in Latin American countries led to liberalization of labor laws. Women have been affected more severely than men by the resulting lack of social protection. A survey using the Personal Health Scale was held in Lima to explore the impact of informal work on the well being of women, based upon the findings of the Gender Sensitive Mental Health Indicators Project which showed that employment was correlated with higher rates of depression and suicide attempts in Peru but not in Canada. The results of this survey showed that women working outside the home feel overburdened by their domestic chores, which men are not willing to share and that they are overwhelmed by the negative impact of lack of “decent work” (by ILO definition), as demonstrated by the large number of “cases” using the Personal Health Scale (Mezzich). The conclusion is that labor laws have to change in order to provide social protection to women and to offset the deleterious effect of the double workload.

WOMEN AND WORK IN SOUTH ASIA

INSTITUTIONS
1. Section on Women’s Mental Health, Pakistan

AUTHORS
1. Unaiza Niaz1, Prof, MD, drunaiza@gmail.com

Women’s work is generally associated with better health. Nevertheless, as women in the workforce, they have to bring changes in their traditional roles which contribute to negative outcomes such as marital strain. In particular, the multiple roles that they fulfill in society render them at greater risk of experiencing mental problems than others in the community. Many studies seem to show that female workers may be exposed to some gender-related stressors which could threaten their mental health and well-being. Professional women in South Asia, like elsewhere face professional rivalries, between men & most interestingly collusion of incompetent women at work, who find more useful to toe the competing men’s line!!! Secondly stress of In laws, & society on working women---to be the traditional little lamb!!! is still a major ordeal for high professional women.

WORK AND WOMEN IN EUROPE

INSTITUTIONS
1. Section on Women’s Mental Health WPA, France

AUTHORS
1. Vivianne Kovess1, Prof, MD

Work in developed countries is related to diverse manifestations of stress, often conceptualized as depression, anxiety and substance abuse. Different work settings that are increasingly available to women as gender-based job division disappears have given place to a variety of disorders such as depersonalization and PTSD. Some risk factors, such as lack of autonomy and caring for others have been found to be associated with higher levels of stress. There is also a reciprocal influence of personality and work. In this presentation, different therapeutic approaches to these complex problems will be discussed.

WORK AND WOMEN’S MENTAL HEALTH IN THE ARAB AND ISLAMIC WORLD: THE EXAMPLE OF TUNISIA

INSTITUTIONS
1. Faculty of medicine of Lyon, France
2. Faculty of medicine of Tunis, Tunisia

AUTHORS
1. Saida Douki Dedieu¹, Prof, Saida.DOUKI@ch-le-vinatier.fr
2. Fathy Nacef²

Occupation ranks sixth amidst the ten major risk factors for the global burden of disease 1990 that affect disproportionately women (WHO, 2000). However, despite increases in women’s labour force participation, gender differences in work-related health conditions have received little research attention. Women’s work is generally associated with better health. Nevertheless, the multiple roles that they fulfil in society render them at greater risk of experiencing mental problems than others in the community. The authors present the results of a study carried out among 1100 subjects on extended sick leave assessed for fitness-to-work. 73% were women experiencing a job-related neurasthenia, according to ICD-10. Some gender-related risk factors are discussed, such as excessive workload, lack of control in lower status male-dominated occupations, lack of reward, violence at work, gender discrimination and role conflict. In Arab and Islamic countries, women are confronted to a specific challenge.

In conclusion, work is one of the critical determinants of mental health for both genders but women today are more exposed to its potential harmful effects. Through their suffering, female workers point out the pervasive gender inequality and not the employment per se.

Through their suffering, working women call for better integrating personal and professional lives for both genders. Fostering a good work-life balance will improve the possibilities for women and men to enjoy both work and family, without being forced to choose between the two.

SeS-081
ETIOLOGY AND MEASUREMENT OF PSYCHIATRIC COMORBIDITY IN ADDICTION

INSTITUTIONS
1. University of Pittsburgh, Pharmaceutical Sciences, Pittsburgh, United States

AUTHORS
1. Ralph E. Tarter¹

This symposium joins recent advances in etiology and intervention research to better inform clinical practice. Acquisition of psychological self-regulation, a primary task of child development, will be discussed in terms of its relation to addiction outcomes in adulthood. Techniques for measurement will be described that focus on comorbidity issues and intervention planning, particularly borderline personality disorder in women and antisocial personality in men. The symposium will conclude with a brief summary by the Chair pertaining to the role of prefrontal cortex maturation on the development of psychological self-regulation, and the need to focus on these neural systems for effective treatment.

Discussion: Ralph E. Tarter - "How Neurobehavioral Development Interacts with Environment to Produce Addiction and Comorbid to Psychiatric Disorders": A brief summary will integrate the theme and findings of the four presentations with special emphasis on describing the neurodevelopmental antecedents of SUD and its variable pattern of psychiatric comorbid patterns. Toward this goal, the method of understanding these outcomes as the outcome of person-environment interactions will be discussed that is practical and amenable to use by clinical psychiatrists.
TRANSMISSIBLE AND NON-TRANSISSIBLE COMPONENTS OF THE LIABILITY FOR ADDICTION: MEASUREMENT MODEL AND PREDICTION OF OUTCOME

INSTITUTIONS
1. University of Pittsburgh, Pharmaceutical Sciences, Pittsburgh, United States

AUTHORS
1. Levent Kirisci1, Ph.D.

Recent investigations conducted at the Center for Education and Drug Abuse Research (CEDAR) have revealed that substance use disorder (SUD) can be partitioned into two components. First, a transmissible component was derived in children that has 80% heritability. And second, a non-transmissible component captures the facet of risk related to primarily environmental factors. These two indexes at ages 10-12 and 16 predict diagnosis of cannabis use disorder by age 22 with approximately 70% and 85% accuracy respectively. This discussion will describe how these two risk indexes were derived and their relation to outcome that commonly occur in conjunction with SUD such as trauma, suicide attempt, sexually transmitted disease, psychiatric disorder, and crime.

THE DEVELOPMENT OF PSYCHOLOGICAL SELF-REGULATION IN RELATION TO ADDICTION AND OTHER PSYCHIATRIC OUTCOMES

INSTITUTIONS
1. University of Pittsburgh, Pharmaceutical Sciences, Pittsburgh, United States

AUTHORS
1. Ada Mezzich1, Ph.D.

This investigation extends the findings pertaining to the transmissible liability index. In particular, the measurement and predictive utility of psychological self-regulation, a main feature of the transmissible liability, will be discussed. A new simple scale will be described as a potentially practical instrument for assessing risk. The cross-cultural analysis, in conjunction with predicting analysis, document the practical usefulness of the Dysregulation Inventory for risk assessment of SUD and comorbid outcomes.
Addiction or substance use disorder (SUD) consequent to consumption of illegal drugs is typically manifest by age 30, after which risk rapidly declines. Accordingly, theory supported by emerging genetic and developmental research, points to SUD as a developmental outcome. Research findings will be described showing that other disorders which are strongly related to SUD risk also have a developmental etiology related to a failure to acquire psychological self-regulation. This presentation will show that SUD, antisocial personality disorder (ASPD) and borderline personality disorder (BPD) can be accurately quantified and measured on a scale using item response theory methodology. An advantage of this latter statistical approach is that it quantifies the importance of each symptom in the diagnosis. Using these new techniques, it will be shown that SUD, BPD, and ASPD are dimensional traits and are highly intercorrelated. In addition, this presentation will shown that gender socialization factors - BPD in females and ASPD in males - capture aspects of SUD risk consistent with failure to acquire psychological self-regulation.

A persisting problem pertains applying research to practice. This presentation builds on the prior presentations by showing that using the N=1 or single subject paradigm, the psychiatrist can adopt a research focus that has important applications in ongoing clinical practice. Examples of the methodology will be described along with a discussion of how N=1 experiments can be used in clinical practice. The discussion concludes with a description of improving treatment based on individualized assessment and tracking, and the design of interventions that incorporate the spectrum of psychiatric disorders preceding as well as concomitant to SUD.

Eighty acutely suicidal borderline patients who had been admitted to medical emergency room with self-intoxication and major depression were studied in a 3-month controlled clinical trial comparing the efficacy of psychoanalytic psychotherapy and nurse psychodynamic crisis intervention. Bipolar disorder, psychotic disorder and severe substance dependence were exclusion criteria. Subjects were randomized at GH discharge after being briefly hospitalized (<5 days) in the same emergency psychiatric service. All patients were simultaneously assigned to the same venlafaxine protocol. Therapists utilized treatments manuals and both quantity of treatment and quality of treatment delivery were carefully controlled in the two treatment groups. Repeated, reliable, blind assessments were conducted at intake, 1-month and treatment discharge (3-months) on a battery of instruments taping global functioning, severity of depression, clinical global improvement and social adjustment. Presence of borderline personality disorder diagnosis was assessed with the IPDE. At the end of the study patients were assigned to continuation treatment (supportive psychotherapy + venlafaxine) under semi-controlled conditions and a further evaluation was collected at 6-month follow-up. The field phase of the study is completed and the results of treatment comparisons are actually under scrutiny. Outcome comparisons and comment will be provided.

Key words: borderline personality disorder, psychoanalysis, psychotherapy, crisis intervention, RCCT, outcome, follow-up
INTERNET: A SOURCE OF NEW PSYCHIATRIC EMERGENCIES? THE CASE OF “ANOREXIA NERVOSA”

Healthcare is one of the major area of Internet activity both as a source of information and for its exchange. This can lead to psychiatric emergencies because of exchange of incorrect information and advice, inappropriate treatments, scaremongering…, but most of these home pages, web sites, chat lines, online user groups try to provide relief for psychology and help their users/members. However, there is one psychopathological field where much of the “interaction” seems intended to attract new recruits, to make pathology appear attractive and where the advice is oriented to highlighting (and aggravating?).

The main features of the pathology: Anorexia Nervosa. Exploring these sites, we have entered a world sometimes jealously defended, often seductive and not without its dangers. Indeed carrying out this study two young researchers (both female psychologists) had a severe crisis which lead to a temporary interruption of their duty.

A number of different viewpoints analysing the stance of the site creators and dominant members are presented and discussed.

AN HOLISTIC EMERGENCY MANAGEMENT PROGRAM FOR A PATIENTS WITH BORDERLINE PERSONALITY DISORDER

Too commonly patients with BPD in crisis end up being concentrated at the emergency services of the general hospitals where they receive momentary help, frequently only medication, and then return home. On other occasions the crisis are dealt with at the hospital although a not insignificant percentage of cases do not remain long enough in order to obtain the desirable benefit.

The authors present an holistic emergency program organized in 2003 in Bilbao providing a “call center”, one extra-hospital crisis unit and three short term stay day centres. Concerning BPD patients, a substantial reduction of hospitalisations occurred. The authors focus on the results obtained in a sample of 70 of these patients attending five days a week, four hours a day a dynamically oriented day center with an average hospital stay of 50 days. Favourable results has been found in patients with borderline personality disorders at the discharge and in a one year follow-up when compared to those of patients with other diagnoses. Co-morbidity, substance abuse, early onset of the symptoms, bad social adjustment and other clinical and social variables were detected as poor outcome predictors.
FIRST EPISODE SCHIZOPHRENIA AND SUBSTANCE ABUSE

INSTITUTIONS
1. San Luigi Gonzaga Hospital, University of Torino, Mental Health, Torino, Italy
2. University of Torino, ASLTO2, Mental Health, Torino, Italy

AUTHORS
1. Rocco Luigi Picci, rocco.picci@unito.it
2. Pier Maria Furlan, piermaria.furlan@unito.it
3. Chiara Marmo
4. Sara Venturello

Aims/Objectives: The correlation between the onset of a psychotic disorder and substance use is a very debated topic in the literature, particularly in its sociodemographic and psychopathological features and in its aspects of course of the disease, prognosis and treatment. With respect to this, we conducted an open prospective study to evaluate the profile of a subgroup of patients abusing substances among patients with first episode of schizophrenia hospitalized in the Psychiatric Service of Diagnosis and Treatment (SPDC Unit), San Luigi Gonzaga Hospital-University of Torino.

Methods: 130 patients were included in the study. Inclusion criteria were: age between 18 and 65 years old, first-episode schizophrenia. All the subjects underwent a clinical evaluation using a semi-structured interview assessing clinical and sociodemographic data, and the following self-report tools: the Brief Psychiatric Rating Scale (BPRS), the Positive and Negative Syndrome Scale (PANSS), the Hamilton Anxiety Rating Scale (HARS) and the Clinical Global Impression (CGI) scale. The evaluations were conducted at T0 (admission to the ward), at T1 (after one week) and at T2 (discharge). The subjects were divided into two groups on the basis of the presence of the substance abuse and the two groups (54% of the subjects abusing substances vs 46% of subjects not abusing substances) were compared.

Results/Conclusions: The study supports the results shown in the literature. Patients with first-episode schizophrenia with substance abuse show more severe psychopathological features and a major resistance to the treatments, in particular referred to positive symptoms and to the "hostility" dimension.

NEW TECHNOLOGIES FOR A THERAPEUTIC IMPROVEMENT IN PSYCHIATRY

INSTITUTIONS
1. San Luigi Gonzaga Hospital, University of Torino, Mental Health, Torino, Italy

AUTHORS
1. Pier Maria Furlan, piermaria.furlan@unito.it

WPA SECTION ON INFORMATICS AND TELECOMMUNICATIONS IN PSYCHIATRY

The authors present some important topics about the use of technology in Psychiatry in order to obtain a therapeutic improvement: a careful evaluation on the telecommunications in psychiatry and mental health in the developing countries; a new support tool for teaching and learning psychopathology; a new “carebook” philosophy based on Internet services, as an electronic agenda for the care planning and care governance of the patients.
A NEW TOOL FOR TEACHING AND LEARNING PSYCHOPATHOLOGY

INSTITUTIONS
1. San Luigi Gonzaga Hospital, University of Torino, Mental Health, Torino, Italy

AUTHORS
1. Pier Maria Furlan\textsuperscript{1}, piermaria.furlan@unito.it
2. Francesco Oliva\textsuperscript{2}
3. Rocco Luigi Picci\textsuperscript{3}, rocco.picci@unito.it

Aims: Teaching psychiatry, especially in the presence of patients, involves a wide range of implications.

- Issues of privacy: to publicize patient’s mental disorder can lead to traumatic repercussions;
- This issue is complicated by the impossibility to be totally certain that patients have actually given their consent;
- The examination and investigation of patient’s symptoms is always a delicate procedure; asking about delusions, soliciting the recall or reproduction of feelings, sensations or even episodes could be considered unethical

This limitation implies a high reliance on the verbal description of complex behaviour or subjective feelings which rarely achieves a scientifically satisfactory level of objectivity and uniformity.

Methods: To overcome these restrictions, we created a DVD which enabled us to combine written descriptions and visual material. 130 scenes from 57 motion pictures featuring the whole spectrum of psychopathological symptoms have been identified. We devised in the home page menu a complete psychopathological framework describing every disturbance of each mental condition, all of which are classified and described in their subtypes. Clicking on one of these disturbances or subtypes, starts a short film clip, while a drop menu lists all the subtypes of the main disturbances, together with a complete list of other illnesses where the symptoms might be present as well as the DSM-IVR classification. Another possibility is to browse within correlate syndromes. Returning to the screen short subtitles occasionally appear in order to pinpoint particular concepts.

Results/Conclusions: The product is a valid teaching and learning tool for trainees, general practitioners and students.

ELECTING MEMBERS FOR ONLINE SUPPORT GROUPS

INSTITUTIONS
1. University of Chicago, Psychiatry, Chicago, United States

AUTHORS
1. Robert Hsiung\textsuperscript{4}, dr-bob@uchicago.edu

Members of online support groups educate as well as support each other. Some, however, benefit more than others. Screening measures may help prospective members decide whether to invest their time and energy in a group. The Group Selection Questionnaire was developed for groups of trauma-exposed adolescents in Bosnia and tested on college students in the US. It assesses expectations, interpersonal openness, and potential for “group deviancy.” Preliminary data on the use of the GSQ in an online support group are presented.
TELE-PSYCHIATRY IN DEVELOPING COUNTRIES

INSTITUTIONS
1. Ain Shams University, Institute of Psychiatry, Faculty of Medicine, Psychiatry, Cairo, Egypt

AUTHORS
1. Tarek A. Okasha, tokasha@internetegypt.com

Tele-psychiatry may prove to be more useful in developing than developed countries. The lack of mental health resources, whether human resources, mental health professionals, inpatient or outpatient facilities and even community care is becoming a problem that is in need of an immediate solution.

Remote areas in developing countries in which transport is difficult and the centralization of services exists only in big cities, makes the next revolution in promoting mental health services in developing countries become the use of telecommunication, to reach the remote areas giving advice about diagnosis, management and reassurance to primary care physicians or mental health professionals. An evaluation of telecommunication in psychiatry and mental health in developing countries will be discussed as well as potential drawbacks.

AN ELECTRONIC DIARY APPROACH TO INTEGRATED CARE DELIVERY

INSTITUTIONS
1. Keele University, University Centre for Health Planning and Management, Darwin Building, Health Information Strategy, Keele, United Kingdom

AUTHORS
1. Michael J. Rigby, m.j.rigby@hpm.keele.ac.uk

Integrated community care delivery can too easily be based on empty wishes and false promises. A new “CareBook” philosophy based on internet services is proposed, comprising a patient electronic diary as the vehicle of cross-organisational care planning and care delivery. It would also enable coordination with other important elements such as regular family member visits.

Coupled with this, the care delivery objectives could be holistically developed and entirely visible to the patient and their immediate carers. This would avoid the risk of one element encouraging a patient to think of being able to self-care, whilst a partner service might be seeking to persuade them to accept a move into residential care. A shared CareBook would enable all agencies to integrate into the common pattern - or instigate discussions if they felt a change was necessary.

Such an electronic diary could also provide the co-ordination for care delivery, particularly where domiciliary delivery is concerned, with its difficulty of physical monitoring. The schedule of care delivery requirements could be re-visualised as a worker-specific schedule, making it much easier to arrange an alternative provider if the scheduled carer is unavailable.

Modern web services have advanced rapidly, as has the concept of “Software as a Service”. Such technologies open up the feasibility of controlled but reliable broker-based real time reading of records such as the CareBook diary.

DIAGNOSING DEPRESSION IN ATHLETES; EDUCATING TRAINERS IN USING A NEW SCREENER

INSTITUTIONS
1. Temple university, psychiatry, Philadelphia, United States

AUTHORS
1. DAVID BARON, PROFESSOR, MSED, DO, DBARON@TEMPLE.EDU

Although the incidence of depression in elite athletes is not well established, the impact it has on athletic performance and overall life satisfaction post competition is significant. The increase in suicide noted in retired football players has prompted the establishment of programs to treat depression in retired players. An emerging concern is the lack of attention to mood symptoms first experienced during the pre-retirement years. One issue is the attitude of coaches, trainers, and athletes themselves concerning mental illness. Mood symptoms have been linked to substance use, as a form of self-medication, and the ending of promising careers. This symposium will present a program in development which trains coaches and trainers how to recognize and refer athletes in need of mental health care before the problem worsens. Members of the WPA Sports Section will present the program and a depression screener being developed for athletes.

Speakers:
Ferenc Turek (Hungary) - Eating Disorders in Athletes
David Baron (USA) - Diagnosing Depression in Athletes: New Techniques

AUTHORS
1. Samir AbdolMagd

Depression is one or the leading causes of morbidity and mortality worldwide. It is present in all people of every age, although its phenotype varies across multiple demographics. The precise incidence of mood disorders in elite athletes is not known, however its existence is well documented. Part of the problem is the ongoing prejudice, lack of awareness by coaches and trainers, and the symptoms vary somewhat from those classical seen and described in the psychiatric literature. This presentation will review the diagnosis and offer suggestions on how to better address this problem.

ADHD IN THE ELITE ATHLETE

INSTITUTIONS
1. Temple University, Psychiatry, Philadelphia, United States

AUTHORS
1. David Baron

ADHD is the most common neuropsychiatric disorder of children and was thought to be outgrown until the late 1970’s. It is now known to be one of the most genetically loaded forms of psychopathology and persistent into adulthood in over 60% of affected children. Beyond the core symptoms of impulsivity, hyperactivity, and distractibility, ADHD effects all aspects of the patients life and is associated with numerous life difficulties. It impact on athletic performance is now being better appreciated. This paper will present data from a survey sample of elite athletes screening for ADHD and discuss appropriate treatments, given the ban on stimulants, as well as effective screening tools for coaches and trainers.
ETHICAL ISSUES AND DOPING IN SPORT

AUTHORS
1. Eliot Sorel1, esorel@gmail.com

WPA Conflict Management & Resolution and Psychiatric Dimensions of Disasters Sections Symposium

In late summer 2005 a powerful hurricane Katrina hit directly the city of New Orleans and its surrounding metropolitan area with resultant massive flooding, loss of lives, property destruction, major displacements of people and activities, inclusive of the areas public and private health care systems. It was the largest natural disaster to ever hit the continental United States.

In the autumn of 2007, the WHO Commission on the Social Determinants of Health held its United States of America workshop in New Orleans, vividly illustrating these dimensions in the context of the post Katrina New Orleans.

Since the devastating days immediately following that hurricane, significant, creative, public/private, academic/community partnerships have emerged rebuilding the city’s devastated infrastructure and health systems. The lessons learned in this context may have relevance to other similar events in other areas of the world.

The authors of this symposium present survivors’ experiences, regionally coordinated hurricane responses and services utilizing information technology and telemedicine, academic/community partnerships illustrations, and address health policy initiatives buttressing integrated, primary care, mental health and public health in a neighborhood based model.

LESSONS LEARNED AND SUCCESSES ACHIEVED: ADVICE FOR GENERAL LIFE SKILLS FROM DISASTER VICTIMS

INSTITUTIONS
1. Clinical Services & Employee Health, New Orleans Health Department, New Orleans, United States

AUTHORS
1. Evangeline Franklin1

AIMS/OBJECTIVES
The lessons learned from persons experiencing phases of disaster, return, relief and recovery can be a helpful source of information.(1) Many individuals not on the front line have very important instructive experiences. This presentation aims to describe the effect of disaster on survivors’ coping skills from the successes that they achieved during and shortly after Hurricane Katrina.

METHODS
The self reported experiences of twenty persons across the Gulf Region including City of New Orleans Health Department leadership were collected. These essays include a description of experiences from pre-storm evacuation planning, return to devastation to working in relief and recovery.

RESULTS
Disaster survivors shared what they learned and how they succeeded in mitigating their traumatic experiences in Hurricane Katrina. From this perspective they identified what was important from their experience as advice for others.

CONCLUSION
Disaster victims/survivors have intense and continuing stresses which can lead to significant despair. However, positive storytelling can extract advice for others that can at once mitigate the negative effects of the experience and provide insight into the coping skills and strategies important to improve life skills in times of normal life and disaster.

TELEHEALTH AND PRIMARY CARE - AN INTEGRATED APPROACH TO ADDRESSING MENTAL HEALTH DISPARITIES AFTER A NATURAL DISASTER

INSTITUTIONS
1. Morehouse School of Medicine, Regional Coordinating Center for Hurricane Response, Atlanta, United States

AUTHORS
1. Ayanna Buckner

AIMS/OBJECTIVES
Populations exposed to natural disasters may experience a multitude of factors that impact their mental health.(1) This session aims to describe how telecommunications technologies are being used in post-Katrina New Orleans and surrounding areas to support mental health care, public health practice, and patient and professional mental health education in underserved communities.

METHODS
The Regional Coordinating Center for Hurricane Response (RCC) developed an age-appropriate, culturally competent, collaborative model of telebehavioral healthcare delivered within primary care environments.(2) Collaborations with primary care providers and administrative staff at federally qualified health centers were established to manage the escalating service need. Additional partnerships were initiated to enhance training and professional support for physicians, psychologists, and therapists in community-based and school-based settings.

RESULTS
The model has increased efficiency and added mental health service capacity. Obstacles and solutions associated with physician licensure and malpractice insurance were identified. Local collaborator support and integration into the primary care environment have remained constant.

CONCLUSION
An integrated approach involving primary care, mental health, and public health practice may produce a sustainable and reproducible telehealth care model to address mental health needs in the aftermath of a natural disaster.

A COMMUNITY-ACADEMIC MODEL TO MOBILIZE MENTAL HEALTH RESOURCES FOLLOWING A MAJOR DISASTER

INSTITUTIONS
1. Tulane University, New Orleans, United States
2. University of California, Los Angeles, United States
3. Rand Corporation, United States

AUTHORS
1. Ben Springgate

Purpose: Community-academic coalitions that follow participatory principles commonly take action to benefit a community, but mobilizing such partnerships for mental health post-disaster have rarely been described.

Background: A high proportion of adults and children demonstrate symptoms of depression or post-traumatic stress disorder following the Katrina disaster.(1) Access to and utilization of appropriate mental health services has been extremely limited.(2)

Methods: We developed a community-academic coalition in New Orleans to address pressing population mental health and health needs. We effectively engaged diverse primary care, faith-based and other stakeholders for necessary action, to leverage resources, to enhance infrastructure, and to develop sustainable leadership. The process utilized community-based participatory research principles and rapid assessment procedures.

Results: Addressing public health concerns across the life span, and commitment to improving access to care, were shared values for coalition development.

Infrastructure was stabilized through in-kind local resources, with support from academic partners and philanthropy outside of damaged areas. Supporting leadership and sustainability were key priorities during the partnership’s evolution.

Conclusions: Community-based participatory research principles can provide sustained leadership for emergence of effective community-driven solutions to mental health needs following a major disaster.

SUSTAINING MULTI-DISCIPLINARY APPROACHES TO PRIMARY CARE THROUGH POLICY REFORM IN POST-KATRINA NEW ORLEANS

INSTITUTIONS
1. Tulane University School of Medicine, New Orleans, United States

AUTHORS
1. Karen B. DeSalvo

Aims/Objectives:
The August 2005 destruction of the New Orleans health system by Hurricane Katrina created an unexpected and unprecedented opportunity to think and reform the antiquated and ineffective system into one emphasizing effective multi-disciplinary community based primary care.

Methods:
From the early days post-Hurricane, those on the front lines of health care have pulled together in unprecedented ways to build broad, yet effective coalitions. These planning groups have focused on changing culture and policy to support a paradigm of health that supports and sustains the primary care focus.

Results:
From makeshift first aid stations, the community created a distributed network of neighborhood clinics to replace what was a centralized and hospital focused system. These clinics offer sophisticated, multi-disciplinary primary care that can attend to the mental, physical and social determinants of health. To support this network, policy and advocacy groups have focused on securing bridge funding as well as long term solutions to ensure sustainability. Together they have raised $100 million in bridge funding and developed a health reform plan designed to reinvent health care in New Orleans.

Conclusion:
Post-Katrina New Orleans is an excellent model of community leadership for transformational change in the health sector.

THE PERSON, THE FAMILY, THE COMMUNITY, AND POPULATIONS’ HEALTH

INSTITUTIONS
1. The George Washington University School of Public Health, Washington D.C., United States

AUTHORS
1. Eliot Sorel

The WPA launched in 2005 the Institutional Program on Psychiatry for the Person. The tributaries of such an initiative are multiple commencing with the traditional healing practices, across cultures and the humanistic tradition of western medicine, dating back to millennia as well as by the challenges posed by extraordinary scientific advances and recent concerns with and challenges of populations’ health.

Our symposium addresses these challenges from multiple perspectives including those of the WPA Program on the Person; the dialectics between the person, the family and carers/clinicians; the person and community health; and populations’ health and health systems. Particular attention is also paid to cultural and other contexts specificity, addressing what is humanly universal and culturally specific.

The challenge posed to the person, the family, communities and populations regarding rapidly evolving technologies, changes in health systems and continuing global inequities and disparities that require concerted attention and involvement of professionals, families and persons is also presented.

2. KWM Fulford
3. Dusica Lecic-Tosevski
4. Juan Mezzich

The WPA Institutional Program on Psychiatry for the Person was established in 2005 following a decision of the WPA General Assembly in response to the recent developments in clinical care and public health. Considerations arising from these developments suggest the high relevance of a comprehensive understanding of health and the centrality of the person in such understanding.

It is increasingly recognized that Modern Medicine is dominated by fragmentation of care and hyperbolic dependence on technology. The Hippocratic dictum "nothing in excess" is applicable in this case. Overspecialization deprives the physician of the biopsychosocial approach and excessive dependence on technology threatens reduction of the physician from "equal to God" (professed by Hippocrates) to that of a mere technologist.

The need for holism in Medicine has been strongly advocated by ancient Greek philosophers and physicians, in fact ethicists of their times, like Socrates, Plato and Aristotle and these ideas are re-emerging in our times.

A different, more comprehensive, more humanistic, more holistic and more person-centered perspective is needed. Additionally, a more person-centered approach concerning the physician is necessary.

THE PERSON IN COMMUNICATION WITH CARERS AND CLINICIANS BEYOND ROLE STEREOTYPES

INSTITUTIONS
1. Medical University of Vienna, Department of Psychiatry and Psychotherapy, Vienna, Austria

AUTHORS
1. Michaela Amering

Context - Community mental health care strives for person-centeredness and resource-orientation. Person-centered care needs well functioning collaboration between mental health workers of different backgrounds with service users and their families and friends.

Objectives - Challenges and chances of new forms of communication and collaborations between users of services, their families and friends and mental health workers will be presented and discussed.

Key messages - Conflicts of the promotion of new roles and responsibilities for patients, carers, and clinicians include the areas of patient self-determination and coercive interventions, confidentiality and family engagement as well as quantitative and qualitative methods of generating evidence. Noticeable consent exists about the need for improvements with regard to access to psychosocial interventions, successful models of vocational rehabilitation, and alternatives for crisis intervention. There is growing interest towards interventions helping users, carers and professionals to collaborate and appreciate each other as equally entitled "experts by experience" and "experts by training", like the Trialogue-model.

Conclusions - Person-centered care will profit from broadening the evidence-base for mental health policy through the inclusion of multiple perspectives and multiple research methods.

THE PERSON AND COMMUNITY HEALTH

INSTITUTIONS
1. University of Melbourne, Australia

AUTHORS
1. Helen Herrman

Mental health is promoted through population-based public health measures as well as health system change. Improving community mental health requires change in public policies affecting health care, as well influence on other sectors such as education, commerce, employment, housing, child and family welfare, and justice. The focus on the needs and dignity of the person form the basis of action at the population or community level as well as at the clinical level.

Poor mental health is associated in high- and low-income countries with social disadvantage, human rights abuses, and poor health and productivity. Effective population-based interventions to promote mental health are possible across the lifespan, and they take place at several levels. Some are distal from the individual, such as policies to improve housing; others closer to the individual, such as combining psychosocial interventions with childhood nutrition programs, and activity programs for older adults. Social and health priorities such as HIV prevention, maternal and child health, violence, substance abuse, and gender equity require interventions focusing on appropriate participation, in turn related to mental health. The presentation will consider the need for wider research and evaluation of public mental health interventions, and the use of subjective measures of mental health as well as community indicators.

THE PERSON, THE FAMILY AND HEALTH SYSTEMS: 21ST CENTURY CHALLENGES

INSTITUTIONS
1. The George Washington University School of Public Health, Washington D.C., United States

AUTHORS
1. Eliot Sorel

The person, the family and health systems are involved in multiple and complex transactions in traditional as well as in modern health systems. They are challenged by the paradoxes of extraordinary scientific discoveries and miraculous medical interventions contrasting with remarkably expanding disparities and inequities.

The challenges posed by this paradox require concerted, focused and consequential health policy innovations that will enhance access, quality and eradicate inequities and disparities.

The author presents the work done collaboratively by policymakers, educators, researchers, practitioners, and civil society, in August 2007 in Buenos Aires, Argentina in revisiting the Alma Ata Declaration of 1978 on Health for All and developing 21st century health systems based on equity with a primary care focus, providing basic health care packages to all persons and families.

Such systems, equitable, primary care focused and mindful of persons, families and communities integrate a continuum of health promotion, protection, and illness prevention with that of primary care mental health and public health integration. The challenging role of professional organization in this process is presented.

OFFICIAL SYMPOSIUM OF THE WPA SECTION ON AFFECTIVE DISORDERS

This symposium looks at depression in its broadest context, and highlights how depression research and treatment is expanding beyond conventional boundaries.

The first presentation by Dr. Roger Pinder (Boundaries of Depression: Overlap of Anxiety and Depression) highlights the overlap between treatments for anxiety and mood disorders and speculates on the overlap neurobiologically. The second presentation by Dr. Cornelius Katona (Boundaries of Depression in Old Age) demonstrates the extended boundaries of depression in the elderly, and how depression interacts with multiple medical and psychiatric comorbidities. The third presentation by Dr. Sid Kennedy (Boundaries of Depression with Neurosurgery: Subcallosal cingulate gyrus deep brain stimulation for treatment resistant depression) takes the boundaries of depression to neurosurgery and presents the work of the world pioneers in deep brain stimulation in the treatment for severe depression. The final presentation by Dr. Sagar Parikh (Boundaries of Depression: Internet Screening and Treatment) looks to expand the boundaries of depression beyond the outpatient office, by examining the role and efficacy of the internet in identifying and facilitating treatment of depression.

BOUNDARIES OF DEPRESSION: OVERLAP OF ANXIETY AND DEPRESSION

INSTITUTIONS
1. International Society for Affective Disorders, London, United Kingdom

AUTHORS
1. Roger Pinder\(^1\), Dr., PhD, roger.pinder@gmail.com

There is considerable overlap between anxiety and depressive disorders in symptomatology, treatment modalities and possible causalities. Many symptoms are common to both types of disorder, while relatively few differentiate the disorders from each other. Many antidepressant treatments, both pharmaco- and psycho-therapeutic in nature, are effective in treating the various anxiety disorders. Indeed, the SSRIs in particular are so well established that anxiety disorders are generally believed to have a serotonergic origin. On the other hand, anxiolytic drugs are relatively ineffective in the treatment of depressive disorders, except as augmenting agents for treatment resistance in the case of buspirone or as a means to combat early insomnia and anxiety induced by some antidepressants in the case of the benzodiazepines.

Evidence is emerging that some depressive disorders, particularly psychotic depression and severe melancholia, are characterized by loss of hippocampal volume. There is as yet no evidence that successful antidepressant treatment restores hippocampal volume to normality, although in experimental animals all antidepressant modalities seem to stimulate neurogenesis in the dentate gyrus. Speculation about the role of a dysfunctional HPA axis resulting in excess levels of neurotoxic glucocorticoids has led to the development of selective antagonists of glucocorticoid receptors as putative antidepressants. Within the anxiety disorders, PTSD also involves loss of hippocampal volume which can be restored by treatment with SSRIs or the antiepileptic phenytoin.

It is likely that some depressive and anxiety disorders have a common biological causality in terms of changes in brain plasticity.
BOUNDARIES OF DEPRESSION IN OLD AGE

INSTITUTIONS
1. University of Kent, Psychiatry, United Kingdom

AUTHORS
1. Cornelius Katona, Dr., MD, c.katona@kent.ac.uk

Depression is common and disabling in older people, often with other psychiatric or physical morbidity and significant psychosocial difficulties. Such co-morbidity may impede diagnosis and management of the depression.

I will examine depression at its boundaries - at the extremes of age, with other morbidities (physical, anxiety and dementia), with being a carer and with immigrant status, using data from a series of cohort studies carried out by my colleagues and myself in the London Borough of Islington. The first of these (Islington 1) was of 700 people aged 65 and over, and the second (Islington 2) included 1085 people. The third study, the London And South East region Study (LASER) involved 224 people with Alzheimer’s Disease (AD) purposefully recruited to be representative of the range of dementia severity found in the community.

Conclusions include a demonstration that mood is the main determinant of quality of life in dementia and that this relationship holds even when cognitive impairment is severe. Depression is more strongly associated with subjective complaints of cognitive impairment in the absence of dementia than with established dementia. Lack of exercise is associated with depressed mood in people with AD. High rates of both depression and anxiety are found in carers of people with dementia, and are particularly related to carers’ physical health, to neuropsychiatric problems in the person with dementia and to the quality of their relationship. Depression in carers is also predicted by lack of emotion focussed coping strategies.

BOUNDARIES OF DEPRESSION WITH NEUROSURGERY:
SUBCALLOSAL CINGULATE GYRUS DEEP BRAIN STIMULATION FOR TREATMENT RESISTANT DEPRESSION

INSTITUTIONS
1. University of Toronto, Psychiatry, Toronto, Canada

AUTHORS
1. Sidney H. Kennedy, Dr., MD, sidney.kennedy@uhn.on.ca

Studies on the neurocircuitry of depression support hyperactivity in the SCg25, which is ameliorated by disparate antidepressant interventions including pharmacotherapy and neuromodulation treatments. The efficacy and safety of Deep Brain Stimulation, particularly for patients with Parkinson's Disease has been established over several decades. Hence, it is not surprising that this technique is being evaluated as an option for the substantial percentage of depressed patients who meet rigorous criteria for treatment resistant depression.

The Neurosurgery and Psychiatry team at the University of Toronto, University Health Network has a five year experience involving 30 or more patients who have received SCg25 DBS and been closely followed. At the time of writing, the initial rates of response and remission (Mayberg et al, 2005) have been sustained. This presentation will address selection criteria, clinical and functional outcomes, predictor variables and ethical considerations for this group of patients. Results will be compared with other published data on DBS to alternative brain targets.

Funding Sources: Support has been received from National Alliance for Research in Schizophrenia and Affective Disorders (NARSAD)-Helen Mayberg Principal Investigator and Advanced Neuromodulation Systems Inc.

References:
Depression reigns as the principal psychiatric cause for disability worldwide, yet multiple factors prevent diagnosis and treatment. Stigma at the level of society, patient, and provider reduces screening for this condition, while resource and access issues restrict availability of treatment. The internet offers potential solutions. Internet interventions provide ease of access, privacy and target varied learning styles. New mental health screening tools such as Feelingbetternow.com provide confidential (anonymous) access to potential diagnoses and sites such as MoodGym and Myselfhelp.com provide self-help treatments, primarily via on-line cognitive behaviour treatment. A number of randomized controlled trials for depression-specific symptoms have been conducted and one with guided self-help for depression (with limited therapist contact) has been successfully delivered over the Internet. Overall, the findings of such interventions are positive both in efficacy and in revealing the ability to overcome various resource and geographic access barriers. This presentation will summarize the most effective depression screening tools available on the internet and review key websites offering self-help treatment, together with a summary of the evidence supporting the use of such tools to improve depression treatment. The internet can expand the reach of depression treatments beyond the boundaries of the outpatient office.

SCHIZOPHRENIA LIKE ABNORMALITIES FOLLOWING PRENATAL MATERNAL IMMUNE SYSTEM ACTIVATION: PREVENTION IN UTERO AND DURING ADOLESCENCE

INSTITUTIONS
1. University of Tel Aviv, Dep. of Psychology, Tel Aviv, Israel

AUTHORS
1. Yael Piontkewitz, Mr., Dr., PhD, yaelpion@post.tau.ac.il
2. Ina Weiner, Mrs., Prof. Dr., PhD, weiner@post.tau.ac.il

Maternal exposure to infection during pregnancy is associated with increased liability to schizophrenia in the offspring, and it has been proposed that elevation of pro-inflammatory cytokines in the maternal host in response to infection is the key factor for fetal brain maldevelopment. The latter has inspired the development of the prenatal immune challenge model of schizophrenia in which the synthetic cytokine releaser polyinosinic-polycytidilic acid (PolyI:C) is used to activate the maternal immune system. Adult offspring of PolyI:C treated dams exhibit behavioral abnormalities reflective of schizophrenia which respond to antipsychotic drug treatment. Here we report that: 1. Adult offspring of dams injected with PolyI:C (4mg/kg) on gestation day (GD) 15, exhibited loss of attentional selectivity and enhanced sensitivity to amphetamine phenotypic of schizophrenia; 2. These deficits were prevented by the co-administration on GD 15 of the antioxidant and glutathione precursor N-acetylcysteine (NAC, 15mg.kg); 3. Administration of the atypical antipsychotic clozapine (7.5 mg/kg) during prepubertal days 34-47 prevented the emergence of these deficits. These results support the hypothesis that immune activation during pregnancy may in part be responsible for the interaction between maternal infection during pregnancy and schizophrenia. Furthermore, they provide the first demonstration that the long term behavioral abnormalities resulting from pregnancy complicated by maternal infection can be prevented, possibly via effects on the immune system.

A large body of evidence points to the involvement of an immune process in the pathophysiology of schizophrenia. Although there is a controversial discussion regarding the type of immune activation, a mild chronic immune process in the CNS may anyway be related to the progressive reduction of brain volume in schizophrenia. The endogenous NMDA receptor antagonist kynurenic acid was discussed to induce psychotic symptoms. Kynurenic acid is mainly produced by activated astrocytes.

We have performed several studies on the immune system and on the kynurenine pathway intermediates including their relationship with the astroglial marker S100B in the CSF.

Our data indicate a predominance of the Th2 system of the specific immune system, while additionally the monocytic system seems to be also activated. We found a strong relationship between kynurenines and S100R in CSF. In contrast to data on CSF and postmortem brain, kynurenic acid appears to be reduced in peripheral blood of schizophrenic patients.

Our data underline the observations of an active immune process in schizophrenia and indicate a functional relationship between the kynurenine pathway intermediates and astroglial function. Previous studies of schizophrenia have demonstrated a significant elevation of KYNA in postmortem pre-frontal cortex and in CSF. These may be related to altered astrocytic function. These data indicate that immune dysfunction in schizophrenia is not just an epiphenomenon, but may be directly related to the pathomechanism of the disorder.
IMMUNE-RELATED PATHOPHYSIOLOGY OF MAJOR DEPRESSION

INSTITUTIONS

AUTHORS
1. Aye-Mu Myint¹, Ms., Dr., MD, PhD, ayem.myint@med.uni-muenchen.de

Major depression is a complicated disease with the pathophysiology which involved different biological mechanisms such as immune response, neuroendocrine regulation, energy metabolism and response to oxidative stress. The first hypothesis was the monoamine hypothesis which emphasized the serotonin availability which was proposed to be linked with tryptophan breakdown. It was linked to the enhanced immune response which is associated with increased pro-inflammatory activity that could in turn increase the tryptophan breakdown into kynurenine by the enzyme, indoleamine 2,3-dioxygenase. Based on the facts (1) that the hypothalamo-pituitary-adrenal axis is hyperactive in major depression, (2) that there were reports demonstrating the hippocampal atrophy in major depression, and (3) that the kynurenine can be further degraded into neuroprotective kynurenic acid and neurotoxic 3-hydroxykynurenine and quinolinic acid, the neurodegeneration hypothesis was proposed. This hypothesis emphasized the imbalance between neuroprotective and neurodegenerative capacity in the neuro-endocrine-immune interactions as the key pathophysiology of chronic major depression. This imbalance is also associated to the energy metabolism and response to oxidative stress. These associations could further explain the consequent medical and neurological diseases and disorders following or coexist with major depression.

CYCLOOXYGENASE-2 INHIBITORS AS TREATMENT OPTION IN MAJOR DEPRESSION AND SCHIZOPHRENIA

INSTITUTIONS

COX-2 inhibition seems to balance the type-1/type-2 immune response and it reduces proinflammatory cytokines. Moreover, COX-2 inhibition has an impact to the glutamatergic neurotransmission and influences the tryptophan/kynurenine metabolism. These components may be involved in the pathophysiology of psychiatric disorders, particularly in schizophrenia and major depression. Due to increased proinflammatory cytokines and PGE2 in depressed patients, antiinflammatory treatment would be expected to show antidepressant effects. Accordingly, an antidepressant effect of rofecoxib was found in patients with osteoarthritis. An own clinical trial using the selective COX-2 inhibitor celecoxib in MD showed a significant therapeutic effect of the COX-2 inhibitor on depressive symptoms. Although these preliminary data have to be validated, these results are encouraging for further studies dealing with the inflammatory hypothesis of depression with regard to pathogenesis, course and therapy. Secondly, we and other groups have performed several studies of COX-2 inhibitors in schizophrenia. The first clinical trial with celecoxib add-on to risperidone in acute exacerbation of schizophrenia showed good therapeutic effect, especially regarding cognition in schizophrenia. Based on data of a second clinical trial, the efficacy of a COX-2 inhibitor seems most pronounced in the first years of the schizophrenic disease process, which is in accordance with animal experiments. It has to be considered, that therapy with COX-2 inhibitors is currently under discussion due to cardiovascular side-effects. Regarding the possible role of inflammation in schizophrenia, depression and possibly other psychiatric disorders, anti-inflammatory therapy should be taken into the focus of further research.
RELIGIOUS PSYCHOPATHOLOGY

INSTITUTIONS

The objective of this Section Symposium is to inform the attendees about research on religious psychopathology. The main topics are religious content of schizophrenic symptoms (visual hallucinations, delusions), and the impact of religiousness on suicide. At the end attendees should be aware of the importance of religious and spiritual issues in psychopathology.

VISUAL HALLUCINATIONS AND RELIGIOSITY IN SCHIZOPHRENIA

INSTITUTIONS
1. Vilnius Mental Health Center, Vilnius, Lithuania
2. Psychiatric University Clinic, Vienna, Austria

AUTHORS
1. Palmira Rudaleviciene, Mrs, MD
2. Thomas Stompe, Dr., MD, PhD

The aim of this study is to identify and assess visual hallucinations for patients with schizophrenia, as well as to identify the relation of hallucinations to sex, age of patients and their age at the onset of schizophrenia, religious faith and personal importance of faith. Examination was conducted on 301 patients (average age - 42.4 (SD 9.8) years; women - 51.5%) of Vilnius Psychic Health Centre. The examination was based on structural international cultural psychiatry study survey. The study was approved by the Lithuanian Bioethics Committee.

Visual hallucinations were observed in 39.1 percent of examinees and no statistically significant difference was established among men and women in terms of frequency of manifestation of this type hallucinations. The majority of examinees specified having religious faith - men considerably more often than women (91.8% and 83.2% respectively), and there were considerably more men than women who admitted personal importance of faith. Relation between hallucinations, faith and personal importance of faith has been identified. Almost one half (42.7%) of the examinees for whom their faith was personally important saw visual hallucinations; however their number among those whose faith was not personally important for them was twice less (21.3%).

It was established that adjusted for age and gender the onset of the disease at an earlier age (before 20) and personal importance of faith are independent factors of manifestation of visual hallucinations for patients with schizophrenia.
RELIGIOSITY AND APOCALYPTIC DELUSIONS IN SCHIZOPHRENIA

INSTITUTIONS
1. Vilnius mental health Center, Vilnius, Lithuania
2. Psychiatric University Clinic, Vienna, Austria

AUTHORS
1. Palmira Rudaleviciene, Mrs., MD
2. Thomas Stompe, Dr., MD, PhD

Religious idea of the world end given in the Sacred Scripture is being found in the content of delusions but is added with inclusion of modern signs and description of apocalypse, produced in delusional thinking of nowadays patients suffering from schizophrenia and related disorders.

Data were obtained from the research, which was conducted in 2006 at the Vilnius Mental Health Center, with permission of the Lithuanian Bioethics Committee.

Inclusion criteria were a clinical diagnosis of schizophrenia already established in patients between 18 and 80 years of age, male and female, who were capable of participating in a productive interview according to their mental state. Structured Clinical Interview was used to perform this study. Examination was conducted on 295 patients. For this study a question about world end was asked to the patients.

Thorough statistical analysis was applied. Continuous or ordinal data were analysed using t test. The quantitative evaluation of the impact of the studied determinants on the development of the end of the world delusions was performed using logistic regression (odds ratio, 95% confidence interval). Level of statistical significance was set at 5%.

Results: 69.8% reported apocalyptic delusional themes (lifetime-prevalence), both religious and culture-sensitive. Investigation of the influence of personal importance of their religious beliefs on the content of (apocalyptic) delusions was made. The conclusion may be drawn that schizophrenia patients for whom their faith is of personal importance feel the coming end of the world more often than those for whom it is not.

THE MYSTERY OF RELIGIOUS DELUSIONS IN SCHIZOPHRENIA

INSTITUTIONS
1. Medical University, Clinic for Psychiatry and Psychotherapy, Vienna, Austria

AUTHORS
1. Thomas Stompe, Dr., MD, PhD

The fact of the existence of religious delusions even in secular Western societies is still unexplained (e.g. Stompe et al 1999, 2001, 2007). Exploring religious delusions by means of statistical analysis reaches its limits when the “anthropological matrix” (Weitbrecht 1963) is taken under consideration. As quantitative study designs fail to provide further insight in this problem, we analyzed the delusional plots of 78 psychotic patients with religious contents using the structure-dynamical approach of Werner Janzarik and phenomenological concepts. The existence of religious delusions seems to depend primarily on dynamic instability, an affective condition very similar to the experience of numinosity described by Rudolf Otto. Our phenomenological analyzes additionally pointed out that religious delusions are no homogenous phenomena. We further distinguished two acute (apocalyptic and visionary experiences) and two chronic forms of religious delusions (value-centered delusions, chthonic-archaic delusions). While acute religious delusional ideas are a nosologically unspecific product of cognitive processing of dynamic derailments, chronic forms are resulting from the interaction between dynamic derailments and basic structural disturbances.
RELIGION AND SUICIDE: IS CATHOLICISM A PREVENTIVE FACTOR AGAINST SUICIDE?

INSTITUTIONS
1. Kaunas University of Medicine, Department of Psychiatry, Kaunas, Lithuania

AUTHORS
1. Virginija Adomaitiene, Mrs., MD
2. Aida Kunigeliene, Mrs., MD
3. Giedre Jonusiene, Mrs., MD

Objective: to assess the situation of suicide rates and the suicide risk factors in the clinics of somatic diseases, to estimate protective factors of suicides, to assess the correlation between suicide rate and religiosity.

Method: the patients from the departments of somatic diseases, who have attempted suicide and the patients, who had depression associated with severe somatic pathology and who had very increased risk of self-harm were assessed with suicide risk assessment interview, the Adult suicidal Ideation Questionnaire, also it was asked about religiosity of the patients. The population included the patients over 18 years old.

Results: Female were greater risk for suicide and parasuicide in somatic clinic. The high rate of suicide associated with adaptation disorders. The patients used the method of suicide - self-poisoning (intoxication of medication).

Conclusion: There were association between religiosity and suicides - the suicide acceptance depends not only on personal but also on contextual levels of religious belief.

NEUROIMAGING RESEARCH IN SCHIZOPHRENIA: AN UPDATE

INSTITUTIONS
1. University of Brescia, Department of Psychiatry, Brescia, Italy

AUTHORS
1. Antonio Vita, Md, PhD

The WPA Section of Neuroimaging propose a Section Symposium with the title “Neuroimaging research in schizophrenia: an update”. The symposium will provide an update of study findings on the most relevant topics of neuroimaging research in schizophrenia, in particular: - changes in gray and white matter and their clinical correlates; - structural brain characterization of deficit vs nondeficit schizophrenia; - the present status of the debate about progressivity over time of brain changes in schizophrenia and its clinical correlates.
THE CONCEPT AND SIGNIFICANCE OF PROGRESSIVE BRAIN CHANGE IN SCHIZOPHRENIA

INSTITUTIONS
1. New York University School of Medicine, Department of Psychiatry, New York, United States

AUTHORS
1. Lynn E De Lisi¹, Dr, MD, delisi76@aol.com

Kraepelin originally defined Dementia Praecox as a progressive brain disease, although this concept has received various degrees of acceptance and rejection over the years since his famous published textbooks appeared. An historical perspective on the current renewal of Kraepelin's concept in brain imaging literature is important to understand what foci are important for future research. Progressive brain change has now been documented in schizophrenia from its earliest stages through its chronic course although it is certainly not linear and not at the same rate of change as that seen in Alzheimer's Disease. Its significance has also been contested by a failure to consistently show any clinical utility to its detection and the notion that neuroleptic medication could have secondary and nonsignificant effects on brain structure. Nevertheless, it is concluded that a great deal of future research is needed focusing on the longitudinal course of change, the extent to the regions of change within each individuals and the underlying mechanism and implications of brain change through functional and neurochemical imaging, combined with structural studies in the same individuals.

PROGRESSIVE BRAIN ABNORMALITIES IN SCHIZOPHRENIA: CLINICAL RELEVANCE

INSTITUTIONS
1. Rudolf Magnus Institute of Neuroscience, UMC Utrecht, Dept of Psychiatry, Utrecht, The Netherlands

AUTHORS
1. Rene Kahn¹, Dr, MD, rkahn@umcutrecht.nl

Brain imaging studies have consistently demonstrated brain abnormalities in patients with schizophrenia. These changes are largely confined to decreases in gray matter volumes and enlargement of the lateral and third ventricles. To date schizophrenia has been considered to result from abnormalities in neurodevelopment, with brain changes to be static. However, schizophrenia has long been thought to be a progressive or a degenerative disorder. Indeed, Kraepelin considered the progressive clinical deterioration to be the hallmark of the disorder. Lately, others have re-emphasized the importance of the decline in functioning in schizophrenia as a clue to its pathogenesis, suggesting that the brain abnormalities in schizophrenia could be expected to reflect this clinical progression. Indeed, we and others have reported brain abnormalities to increase over time in schizophrenia. Interestingly, not all patients show changes in brain volumes over time: the changes are particularly pronounced in those patients with a poor prognosis in the first years of illness. Moreover progressive changes are most pronounced in the frontal and temporal areas as postulated by Kraepelin over a hundred years ago. Interestingly, white matter did not change over time. Finally, the progression in these frontal brain changes appeared to be attenuated by treatment with atypical, but not by typical antipsychotics. Thus, brain changes are progressive in schizophrenia and are clinically relevant since they are related to outcome. Questions such as whether these changes can be reversed with early pharmacological intervention and whether there is a point at which the brain changes become irreversible, become pertinent.
GRAY MATTER CHANGES IN SCHIZOPHRENIA: HETEROGENEITY AND CLINICAL IMPLICATIONS

Introduction and objectives: findings of the gray matter changes in schizophrenia are quite heterogeneous (Honea et al., 2005). If the heterogeneity in the results reflects the heterogeneity of the illness we might try to use the morphological assessment for the search for clinically distinct schizophrenia subgroups.

In this sense Wilke et al. (2001) found a link between the level of functioning and gray matter volume in the left prefrontal cortex in chronic schizophrenia patients. The aim of our present study was to find such relationships between baseline gray matter morphology and consequent global functioning in a group of first episode schizophrenia patients.

Methods: VBM of the baseline gray matter (at the time of the first episode) with the regression analysis with the GAF score (measured one year after the first episode) and a group comparison between good-, poor-functioning patients (GAF score cut-off = 60) and healthy controls.

Results: there was a positive correlation between the baseline prefrontal gray matter volume and the GAF score. The poor-functioning patients had a significant extent of gray matter volume loss in the prefrontal cortex when compared with the healthy subjects, whereas no such relationship was found for good-functioning patients.

Conclusions: the baseline morphological analysis can find differences between two clinically defined subgroups of schizophrenia. Further work is desired to find the ways how to translate such results into the clinical practice.

THE ROLE OF WHITE MATTER PATHOLOGY IN SCHIZOPHRENIA

INSTITUTIONS
1. Inter-University Center for Behavioural Neurosciences, University of Udine and University of Verona, Italy, Section of Psychiatry, DPMSC, Udine, Italy

AUTHORS
1. Paolo Brambilla¹, Dr, MD, PhD, paolo.brambilla@uniud.it

Aims/Objectives White matter connectivity disturbances have been suggested to play a major role in schizophrenia. To this extent, diffusion weighted imaging (DWI) is a relatively new technique examining subtle white matter microstructure organization. In this presentation, the role of white matter pathology as a potential intermediate endophenotype in schizophrenia will be debated.

Methods evidence from post-mortem, imaging, and genetic studies exploring white matter pathology in schizophrenia will be presented.

Results there are consistent findings from different lines of investigations providing evidence that white matter communication is impaired in schizophrenia (1,2), possibly representing a common endophenotype for major psychoses.

Conclusions The literature supports the hypothesis that there is a cortico-cortical and transcallosal altered connectivity in schizophrenia, which may be relevant for the pathophysiology and the cognitive disturbances of the disorder. Future longitudinal diffusion and functional imaging studies targeting brain communication together with genetic investigations should further characterize white matter pathology in schizophrenia and its relevance for the development of the illness.

The diagnosis of Deficit Schizophrenia (DS) identifies a clinically homogeneous subgroup of patients characterized by the presence of primary and enduring negative symptoms. Findings of brain structural abnormalities in patients with DS as compared with those with Nondeficit Schizophrenia (NDS) and Healthy Comparison Subjects (HCS) have been mixed. The present study included 34 patients with DS, 32 with NDS and 31 HCS. The Schedule for the Deficit Syndrome was used to categorize patients as DS or NDS.

The two patient groups were matched on age and gender and did not differ on any clinical variable, except for higher scores on the negative dimension and more impaired interpersonal relationships in DS than in NDS subjects. Lateral ventricles were not enlarged in patients with DS, as compared with HCS, while were larger in NDS than in HCS. NDS, but not DS patients, as compared with HCS, had smaller cingulate gyri. Volumes of dLPPFC and temporal lobes were smaller in both patient groups than in HCS; however, DS patients had significantly less right temporal lobe volume as compared to NDS patients. These findings do not support the hypothesis that deficit schizophrenia is the extreme end of a severity continuum within schizophrenia.

THE INTEGRATION OF NONVERBAL PSYCHOTHERAPEUTIC WORK IN PSYCHIATRY AND PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany
2. German Academy for Psychoanalysis, Munich, Germany

AUTHORS
1. Maria Ammon1
2. Ilse Burbiel2

The authors introduce Dynamic Psychiatry as a discipline which integrates psychotherapy, psychoanalysis, group dynamics and psychiatry and which is in a continuous development for the sake of treatment. This means the treatment methods for personality disorders, psychoses, comorbid diseases and all early traumatized patients has to integrate creative, healthy and constructive areas of the human being and has to understand the person as a multidimensional, holistic being with creative potentialities. Recent brain research results, attachment theory, transgenerational transmission and early traumatized effects on the personality will be considered, as well. The treatment methods have therefore to integrate expressive creative group psychotherapy methods like dance-, theatre-, music-, art therapy - especially milieu therapy and others.
CREATIVE THERAPY IN DYNAMIC PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Maria Ammon\textsuperscript{1}, Dr., dapberlin@aol.com

Dynamic Psychiatry considers man as a holistic being with creative and constructive potentialities. Psychic illness is understood as a destructive and deficitary personality development with the possibility of disintegration in life situations of loss, psychic stress a. o. Therefore the author stresses the necessity of working with the creative dimensions of the patients in psychiatry and psychotherapy first for stabilization and second for a further development of the personality of the patient. Nonverbal creative therapies will be demonstrated for treatment.

A GROUP CONFLICT IN DANCE THERAPY - ATTEMPT OF A GROUP DYNAMIC INTEGRATION

INSTITUTIONS
1. German Academy for Psychoanalysis, München, Germany

AUTHORS
1. Ilse Burbiel\textsuperscript{1}, Dr., info@psychoanalysebayern.de

For many years the authors have been leading a dance therapy group according to the dynamic psychiatric concept of Günter Ammon. Dance therapy is a successful nonverbal facet of the therapeutic network of Dynamic Psychiatry in addition to the predominantly verbal individual and group psychotherapy. The author's concern is to show, how a so called "committer-victim" conflict, which had been developed in a dance session, can be worked through and finally solved by means of group dynamic processes within verbal and dance therapy. The conflict was solved by revealing it to the group so that all group members had the opportunity to participate and gain from it. A committer-victim conflict changed into a group conflict. The fear to be excluded from the group, experienced by committer and victim likewise, as well as the experienced sense of shame and guilt can be diminished in this way.
DANCE THEATRE - SELF-AWARENESS AND PSYCHOTHERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Gabriele von Bülow¹, Mrs., G.v.Buelow@t-online.de

Dance theatre is a form of group dynamic self-awareness that developed from human-structural dance, integrating elements of theatre work in the context of human-structural theatre therapy as well as psychoanalytical group dynamics. In this, the dance theatre project functions as a third object that, on the one hand, reflects the group dynamic process while, on the other, spurring it on. It provides a nonverbal and group dynamic extension of the outpatient treatment spectrum, especially for patients with severe structural deficits. The process of a ten-day dance theatre project, which worked on scenes from “The Creatures of Prometheus” by Ludwig von Beethoven will be described and illustrated by video excerpts.

ANALYTIC MILIEU THERAPY AND GÜNTER AMMON’S CONCEPT OF CREATIVITY

INSTITUTIONS
1. German Academy for Psychoanalysis, Berlin, Germany

AUTHORS
1. Monika Dworschak¹, Mrs., monika.dworschak@gmx.de

Günter Ammon’s basic concept of analytic milieu therapy is the basic treatment method in the Dynamic Psychiatric Hospital Mengerschwaige for the last 30 years. This specific treatment method includes many aspects of creativity as developed in Günter Ammon’s concept of creativity. Ammon understands creativity not only in the sense of producing creative artistic work but also as processes or activities of a person in daily life in the sense of basically new dimensions in acting, thinking, behaving etc. The author describes this concept of creativity in every day processes in analytic milieu therapy which has been used very effectively in the treatment of early disturbed patients.
INDICATIONS AND THERAPEUTIC EFFECT OF HUMAN-STRUCTURAL INPATIENT MUSIC THERAPY

INSTITUTIONS
1. German Academy for Psychoanalysis, München, Germany

AUTHORS
1. Egon Fabian*, Dr., efabian@klinik-menterschwaige.de

The present paper describes music therapy as practiced in the Dynamic Psychiatric Hospital Menterschwaige in Munich. Following a short historical outline, the authors describe human-structural inpatient music therapy as a nonverbal therapy, characterized by specific features differentiating it from other forms of psychotherapy. It is particularly apt, by making use of free improvisation, to render group-dynamic processes "audible," to diminish anxiety and to facilitate interpersonal contact and relationships in the here-and-now situation of the group. These features are of advantage in the therapy of symbiotic, anxious, autistic and paranoid patients. The therapeutic effect of human-structural music therapy can be deduced from the patients' own answers on questionnaires and from the therapists' interventions on several possible levels, taking into consideration the present unconscious group dynamics, as well as individual transfer and counter transfer phenomena, and using both metaphoric interpretations of the group atmosphere and music-theoretical interpretations. Thus, without using a specific technique for each diagnostic category, it allows therapeutic work with a wide range of pre-oedipally disturbed patients, when integrated in the global therapeutic milieu of the hospital.

Objective: The impulse control disorders not otherwise classified have been grouped together based on similar symptoms and diagnostic criteria. There is a growing body of literature on the basic neurobiology of behaviors associated with these disorders that could be used in future diagnostic classifications.

Methods: Data will be presented from functional magnetic resonance imaging (fMRI), and diffusion tensor imaging (DTI) combined with behavioral laboratory tasks that are designed to measure basic components of behavioral inhibition and decision making in substance dependent subjects and controls.

Results: This data supports a link between impulse control and decision making to specific brain regions and neurotransmitter function, including dopamine and serotonin.

Conclusions: These results will be discussed in light of similar findings in patients with impulse control disorders to show that the underlying neurobiology of these behaviors could be used as a tool in the classification of these disorders.

OVERVIEW OF DIAGNOSTIC CATEGORY DISCUSSIONS FOR IMPULSE CONTROL DISORDERS

INSTITUTIONS
1. Yale University School of Medicine, Psychiatry, New Haven, United States

AUTHORS
1. Marc N Potenza¹, Professor, M.D., Ph.D., marc.potenza@yale.edu

Impulse control disorders (ICDs) include pathological gambling, intermittent explosive disorder, kleptomania, pyromania, trichotillomania and ICD not otherwise specified. These disorders are currently categorized together in the category of ICDs Not Elsewhere Classified. These ICDs, as well as others under consideration in the domains of shopping, sex, computer use and nail-biting/skin-picking, have been conceptualized in several non-mutually exclusive manners, including as obsessive-compulsive spectrum disorders and as “behavioral” addictions. In workgroup meetings sponsored by the American Psychiatric Association, National Institutes of Health and World Health Organization, Dr. Potenza has participated in clinical and scientific discussions on obsessive-compulsive spectrum disorders and substance use disorders, respectively, in anticipation of DSM V and ICD 10. Specifically, Dr. Potenza’s role focused on the current understanding of the relationships between impulse control disorders, obsessive-compulsive disorder and addictions. Comprehensive analyses of multiple domains (phenomenology, epidemiology, co-occurring disorders, family histories, genetics, neurobiology, pharmacology, behavioral and drug treatments, and culture) were performed. These analytic reviews identified heterogeneities within and across ICDs, with some ICDs showing close similarities with substance use disorders and others like trichotillomania showing closer ties to obsessive-compulsive disorder. Implications of these findings for DSM V and ICD 10 will be discussed.
CHILDHOOD BEHAVIOR AS A METHOD OF CLASSIFICATION OF IMPULSE CONTROL DISORDERS IN ADULTHOOD

INSTITUTIONS
1. Stockholm University/Karolinska Institute, Centre for Health Equity Studies, Stockholm, Sweden
2. Karolinska Institute, Department of Women and Child Health, Stockholm, Sweden

3. Britt A Klinteberg, Professor, Ph.D., bkg@psychology.su.se

The focus is on the possible influence of childhood hyperactive behavior on adult psychopathy, and how adult, clinically rated, psychopathy tendencies are related to self-reported personality. The sample comprised 152 male subjects, including young lawbreakers (n=98) and controls (n=54), prospectively studied over their life time. Ratings of childhood behavior were obtained from a psychiatrist and data on adult personality (using the Karolinska Scales of personality and a shortened form of the Eysenck Personality Questionnaire) and psychopathy were obtained using the Psychopathy Check List (PCL).

Subjects with high PCL as adults (n= 36) scored higher than low PCL subjects (n= 116) on the majority of the personality dimensions studied, even when controlling for criminality. Former childhood hyperactive subjects (n= 26) displayed higher impulsivity and hostility than nonhyperactive subjects (n= 126) when criminality was controlled for. Among the high PCL group subjects there was an overrepresentation of childhood hyperactive males. They displayed significantly higher impulsivity and verbal aggression than their respective nonhyperactive counterparts and were characterized by extreme scores on several psychopathy-related personality scales. Further, there was a significant interaction effect between hyperactivity and PCL on the narrow/noninclusive form of impulsivity. The findings of the present personality-based approach were in favour of childhood hyperactivity being crucial as risk indicator in the development of impulse control disorders in adulthood. This was also confirmed by results of significantly higher frequencies of individuals characterized by a pattern of childhood hyperactive behaviour, early alcohol problems, and violent offence. Hyperactive behaviour and violence in turn were found to be significantly associated with decreased serotonergic function as measured at adult age.

NEUROBIOLOGICALLY BASED CLASSIFICATION OF IMPULSE CONTROL DISORDER: ROLES OF COMORBIDITY, TIME COURSE, AND RESPONSE TO TREATMENT

INSTITUTIONS

3. Scott D Lane, Professor, Ph.D., scott.d.lane@uth.tmc.edu
4. F. Gerard Moeller, Professor, M.D., frederick.g.moeller@uth.tmc.edu

Impulsivity, resulting from a failure of the balance between the initiation and screening of action, is present in a wide range of psychiatric illnesses. As would be expected from its central role in the initiation of action, impulsivity is a multifaceted entity. Its neurobiology can be related to regulation of limbic arousal, attention, or motivation, each of which has different neurobiological substrates and pharmacological sensitivities. For example, some aspects of impulsive behavior appear to be sensitive to drugs that enhance serotonergic function, while others are not. Further, the time course of impulsivity can be complex, with state- and trait-like mechanisms. Disorders of pathological impulsivity must be classified according to these characteristics as the basis for rational diagnosis and treatment. In addition, impulsivity can be a prominent part of a more general disturbance, like substance use disorders, affective disorders, or schizophrenia, or can be the central feature, as with intermittent explosive disorder. We propose a scheme whereby disorders of impulse control are classified according to 1) primary or secondary role of impulsivity, 2) pharmacological sensitivity, largely based on response or lack of response to serotonergic agents, and 3) time course. We will summarize pharmacological, genetic, and neurobehavioral evidence supporting this schema.
UTILIZING RESPONSE TO TREATMENT AND GENETICS AS A METHOD FOR CLASSIFYING IMPULSE CONTROL DISORDERS

INSTITUTIONS
1. University of California Irvine, Long Beach VA Healthcare System, Psychiatry, Long Beach, United States

AUTHORS
1. Christopher Reist¹, Professor, M.D., creist@uci.edu

Currently the Diagnostic and Statistical Manual (DSM-IV-TR) recognizes a number of distinct impulse control disorders (ICDs) including pathological gambling, kleptomania, pyromania, intermittent explosive disorder, and trichotillomania. Criteria for other ICDs (compulsive shopping, problematic internet use, compulsive sexual behavior, and compulsive skin picking) are currently under consideration. Despite significant advances in our understanding of the neurobiology and pharmacotherapy of ICDs little of this information has been taken into consideration as classification strategies evolve. This session will examine the value of existing genetic data as well as patterns of response to pharmacotherapy for identifying distinctions between ICDs. Particular focus will be given to genetic variants in dopamine, noradrenergic, and serotonergic neurotransmitter pathways.

WPA SECTION ON URBAN MENTAL HEALTH

Half of the world population lives in urban areas. The rapid growth of urban agglomerates is often accompanied by social, environmental and cultural changes that have a significant impact on health and mental health. This symposium deals with some of the emerging field of research in the field. First epidemiological evidence that being in an urban is associated with higher incidence of schizophrenia in urban area will be reviewed. Second urbanization and patterns of substance abuse in the UK will be summarized. Lastly, international trends of suicide will be discussed with a particular emphasis of urban vs rural rates. These presentations will be followed by a discussion.
URBAN BIRTH OR URBAN RESIDENCE AND THE RISK OF MENTAL DISORDER

INSTITUTIONS
1. Health Care Research Agency, Emilia-Romagna Region, Bologna, Italy

AUTHORS
1. Giovanni de Girolamo

Several epidemiological studies have tried to clarify the relationship between urban birth or residence, and incidence and prevalence rates of various mental disorders. There is robust and consistent evidence showing that urban birth is a risk factor for schizophrenia and other psychotic disorders. Whereas the relative risk for people who live in urban areas is modest (about two fold compared with rural birth), the attributable risk is high: 30% of the variance in the incidence of schizophrenia can be explained by urbanicity. The number of people exposed to this risk is high and it will increase rapidly as urban populations are increasing in both developed and developing countries. More specifically, urbanicity is a risk factor when the exposure is from birth to at least the 15th birthday. Urban-rural differences in the risk of schizophrenia are rooted entirely in the family; all findings of studies published so far are consistent with this hypothesis. Also prevalence rates of common mental disorders (e.g., depressive and anxiety disorders, substance and alcohol abuse) show an urban-rural gradient. In this presentation the results of the most recent studies in these areas will be reviewed and suggestions for future research will be presented.

URBANIZATION AS A RISK FACTOR FOR DRUG USE AND MISUSE

INSTITUTIONS
1. University of Hertfordshire, School of Pharmacy, Hatfield, Herts, United Kingdom

AUTHORS
1. Fabrizio Schifano

More than half of the world population is living in urban areas, but the evidence about urban-rural differences in drug use is not clearly defined.

During the talk, a literature review focussed on the role of both urbanization and other socioeconomic parameters in influencing drug use and misuse will be offered.

Most recent modifications of drug supply/purchase associated with the Internet revolution will be reviewed as well. Although it has been suggested that the drug misuse is typically a characteristic of large urban areas, the urban context may offer a relative proximity of health services and prompter emergency intervention in case of overdose. Furthermore, our data showed that vending websites, which include online pharmacies, are becoming increasingly popular. Clinicians are all too familiar with the drug abuse and its associated consequences in the socioeconomically deprived patient population. However, since the Internet access is more typically available to the privileged sections of society, our stereotypical image of the 'drug abusing, metropolitan' patient may need to change.
URBANIZATION AND SUICIDE: GLOBAL TRENDS

INSTITUTIONS
1. New Jersey Medical School, Psychiatry, Newark, United States

AUTHORS
1. Giovanni Caracci

Suicide rates have been increasing globally overall the past few decades. It is predicted that by the year 2020 approximately 1.53 million people will die from suicide.

Aims: To review global trends in suicide rates.

Methods: Review of the literature on global trends of suicide

Results: There are major differences in suicide rates between urban and rural population. In addition, gender, age, religious and cultural factors have a major impact on suicide rates worldwide. Current evidence addressing the reasons for higher suicide rates existing in some countries will be presented.

Conclusions: We will address the implications of our findings for prevention and policies.

SEVERE PERSONALITY DISORDERS IN URBAN AREAS

INSTITUTIONS
1. Mental Health Department, Local Health Unit, Bologna, Italy

AUTHORS
1. Mariano Bassi, Dr., MD, tarpon8349@libero.it

Severe personality disorder is common in the community, especially in urban areas. People with severe personality disorders come up against more unfavourable course and outcome and more difficult treatment. This problem is increasing in the urban areas. People meeting criteria are well represented in mental health facilities, with estimates of 10-12% at community mental health centers and 20% in emergency or inpatient units. The female patients are more represented in the community mental health centers (70%), on the other hand the male patients are more represented in substance use centers (40%) and in the justice system (30% in jail or in seclusion wards). Psychiatrists working every day in big cities are finding on an increasingly more frequent basis that they must diagnose and treat a particular type of patient. These patients meet with psychiatrists when they are urgently admitted or in the emergency room, whether they are examined at a Community Mental Health Center or in the emergency room of a general hospital in a big city. More frequently, psychiatrists encounter these “new patients” while providing psychiatric consulting services at so-called “borderline areas”. These are young patients, prevalently male, affected by a “impulsive cluster” personality disorder, with a history of various duration of substance dependence or abuse, previous episodes of clear anti-social behavior and consequent problems of criminal nature, which have been examined for the first time by services for substance-related disorders, social services for homeless people or health services which are responsible for treating people in jail.

SELECTED TOPICS IN PSYCHIATRIC EPIDEMIOLOGY AND PUBLIC MENTAL HEALTH

INSTITUTIONS
1. Michigan State University, Epidemiology, East Lansing, United States

AUTHORS
1. James C. (Jim) Anthony¹, Professor Dr., M.Sc., Ph.D., janthony@msu.edu

This symposium is sponsored by the WPA Section on Epidemiology and Public Health. Its focus is selected topics in psychiatric epidemiology and public mental health, including psychiatric disturbances of the elderly. Each speaker will present evidence from recent epidemiological and public mental health research.

UNMET NEEDS OF CANNABIS SMOKERS - AN EPIDEMIOLOGICAL INQUIRY AND TYPOLOGY

INSTITUTIONS
1. Technical University of Dresden, Institute of Clinical Psychology and Psychotherapy, Dresden, Germany
2. Center for Clinical Epidemiology and Longitudinal Studies, Dresden, Germany

AUTHORS
1. Hans-Ulrich Wittchen¹,², PhD
2. Silke Behrendt¹,²

AIM: To provide a quantitative estimation and evaluation of unmet needs for treatment among cannabis smokers, with a focus upon a typology of cannabis problems and needs.

METHODS: Referring to recent findings on cannabis use disorders (CUD) from the European Monitoring Center for Drugs and Drug Addiction, data are presented from a community sample of over 3000 subjects aged 14-24 at initial recruitment (among which n=1395 were cannabis users), followed up for three repeated assessments over 10 years. Latent class analyses were used to identify clinically meaningful classes of cannabis use-related problem profiles.

RESULTS: In general, European countries report an increase in the number of CUD clients in treatment. The main drug compounds used by clients seeking treatment at the participating centers were opioids, followed by cannabis, cocaine, and amphetamines (with marked between-country variation), and with polydrug use as the rule (83%). With respect to trends over time, levels of heroin use and cocaine use seem relatively stable, but levels of cannabis smoking seem to be increasing, at least for some countries. Experts complain that they do not know what to do with ‘primary’ CUD patients. Latent class analyses revealed six meaningful classes of longitudinal cannabis use problem profiles that could provide some guidance for rational planning of treatment for cannabis disorders.

CONCLUSION: The reported results highlight several issues that deserve our attention: (1) lack of established treatments, (2) need for more detailed inquiry into the needs of patients and potential targets for intervention.
EPIDEMIOLOGICAL EVIDENCE ON MENTAL HEALTH BURDENS IN UKRAINE

INSTITUTIONS
1. Stony Brook University, Stony Brook, United States

AUTHORS
1. Evelyn Bromet1, PhD, evelyn.bromet@stonybrook.edu

AIM: This paper describes recent epidemiological evidence from the World Mental Health Survey conducted in Ukraine, with a focus upon population-level estimates of mental health burdens, and with comparison to evidence from other countries of Eastern Europe.

METHOD: The data on Ukraine were gathered during 2002. A nationally representative sample of 4725 adults in Ukraine was interviewed with the World Health Organization (WHO) Composite International Diagnostic Interview (CIDI). The assessment covered demographic characteristics, trauma, smoking, and parental and personal psychiatric disorders. Current functional impairments and recent service utilization also were assessed.

RESULTS: Close to one third of the population experienced at least one Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition (DSM-IV) disorder in their lifetime. Roughly 18% experienced an episode in the past year, and 10-11% had a current disorder. No male-female differences were found. In men, the most common diagnoses were alcohol disorders (26-27% lifetime) and mood disorders (9-10% lifetime); in women, they were mood disorders (20-21% lifetime) and anxiety disorders (7-8% lifetime). Age of onset was primarily in the teens and early 20s.

DISCUSSION: The discussion of these results will cover conceptual and methodological issues, as well as comparisons with pertinent data from other countries of Eastern Europe.

THE GERIATRIC DEPRESSION SCALE (GDS) - A META-ANALYSIS OF ITS VALIDITY

INSTITUTIONS
1. Medical University of Vienna, Austria

AUTHORS
1. Johannes Wancata1, Dr., MD
2. Fabian Friedrich1
3. Maria Weiss1
4. Barbara Marquart1

AIMS: The objective was to provide analyse the screening accuracy of both versions of the Geriatric Depressions Scale (GDS-30, GDS-15) and to compare the validity indices of the GDS with those of other screening instruments.

METHODS: Medline, other electronic search tools and previously published reviews were used to search for published studies. The following studies were excluded: samples with less than 50 participants, no clear external case criterion, telephone-versions and psychiatric samples.

RESULTS: Of the 173 papers read, 45 studies fulfilled the above mentioned criteria and could be included for detailed analyses. For both GDS versions similar mean validity indices were found (GDS-30: sensitivity 0.753, specificity 0.770; GDS-15: sensitivity 0.805, specificity 0.750).

Using pooled samples we could find significant differences between the two versions of the GDS. For the GDS-15, the mean sensitivity in nursing homes was significantly higher than among outpatients, while we could not find significant differences between specificities. For the GDS-30, the mean sensitivity as well as the mean specificity were significantly higher among inpatients than among outpatients. Using comparative studies based on identical samples, both GDS versions showed significantly better validity indices than the “Yale-1-question” screen, but did not differ from the “Center for Epidemiological Studies Depression scale” (CES-D).

CONCLUSIONS: A large proportion of validity studies had to be rejected because of methodological flaws. Considering that often persons with marked cognitive impairment had been included, both versions of the GDS might be useful for screening purposes in clinical work.
DIRECT COSTS ASSOCIATED WITH MILD COGNITIVE IMPAIRMENT

INSTITUTIONS
1. University of Leipzig, Department of Psychiatry, Public Mental Health Research Unit, Leipzig, Germany
2. University of Leipzig, Department of Psychiatry, Health Economics Research Unit, Leipzig, Germany

AUTHORS
1. Steffi G. Riedel-Heller¹, Prof.
2. Melanie Luppa¹, Mrs.
3. Hans-Helmut Koenig², Prof.

Background: The purpose of the study was to examine whether MCI is associated with an increase in direct costs, as cost increases have been shown for mild dementia disorders in previous studies. To our knowledge, this is the first study investigating the association of direct costs and MCI according to recent diagnostic criteria from a societal perspective.

Methods: A representative sample of 452 primary care patients aged 75+ from the Leipzig, Germany (AgeCoDe-Study), were investigated in face-to-face interviews regarding MCI according to the current diagnostic criteria of the International Working Group on MCI, resource utilisation and costs (cost diary), as well as chronic medical illness (Chronic Disease Score). Resource utilisation was monetarily valued using 2004/2005 prices.

Results: Mean annual direct costs were €4,443 for patients with MCI (N=39) and €3,814 for patients without MCI (N=413) (p=0.34). Looking at the cost components, patients with and without MCI only significantly differed regarding pharmaceutical costs (€1,210 vs. €1,062; p<0.05) not caused by antidementive drugs.

Conclusion: Direct costs of individuals having MCI are not significantly increased in comparison to direct costs of individuals without cognitive deficits.

5. Don Schopflocher, PhD
6. Rob Williams, PhD
7. Vickii Williams, Ms.
8. Rob Wood, PhD

AIMS: To review the need for prospective studies on gambling problems. To appreciate the rationale for the selection of biopsychosocial resources. To identify the characteristics of the at-risk gambling population. To report results from a recent prospective study of risk and protective factors resulting in gambling problems.

METHODS: The methods included the recruitment of 5 age cohorts through random digit telephone dialing in Alberta’s urban and rural areas. Ages 13-15 N=435; 18-20 N=315; 23-25 N=342; 43-45 N=403; 63-65 N=313. The cohorts involve a general population sample and an at-risk group determined by a 70th percentile cut-off in gambling expenditure (more than $10 per month), frequency (at least a couple of times/month) and a problem screening instrument. The selection of bio-psycho-social measures and instruments will be reviewed. A 5 year follow-up is planned: Y1 was face-to-face, the other follow-ups are to be by telephone or email.

RESULTS: A comparison of the general (N=897) vs at risk (N=911) populations will be presented including demographic characteristics, correlations with gambling behavior as well as the prevalence of psychiatric comorbidities and physical health.

CONCLUSIONS: Implications for policy, services planning, and future research will be discussed.

AUTHORS
1. Mirjana Radovanovic, MD, MSc, mradovanovic@epi.msu.edu
2. James C. (Jim) Anthony, Professor Dr., M.Sc., Ph.D., janthony@msu.edu

AIM: To estimate the effects of drug use and dependence on the occurrence of pathological gambling.

METHODS: Data are from the United States Epidemiological Survey on Alcohol and Related Conditions (NESARC), a two-wave epidemiological study with a probability sample of community respondents assessed at baseline in 2001-2 and followed up roughly three years later. More than 2200 of the 43,093 community respondents reported to have experienced at least one gambling related problem ever, and more than 150 qualified for DSM-IV pathological gambling in a year prior to assessment. These cases were combined into risk sets with local area-matched non-cases, and the conditional form of multiple logistic regression was used to estimate covariate-adjusted associations.

RESULTS: Estimated associations between pathological gambling (PG) and drug dependence (DD) were most pronounced in cross-sectional analyses; the evidence of a causal link from DD to PG was much less robust in the prospective analyses. There is some interesting evidence supportive of male-female differences in the prospectively ascertained patterns of association, in some respects akin to cross-sectional evidence reported by Desai & Potenza (2007).

CONCLUSIONS: The evidence seems most consistent with a conceptual model of reciprocity, with drink/drugs having an influence on PG and with PG having an influence on drugs/drinking, but this model will require multi-wave prospective research for clear resolution.

BACKGROUND & AIM: Impulsiveness is a personality characteristic, which is associated with high levels of substance use, may predispose to development of specific types of addiction, and linked to poor treatment outcomes in alcohol or drug dependence. The objective of the study was to identify genotypes associated with impulsivity in alcohol dependent patients.

METHODS: The study entailed 154 patients treated for alcohol dependence in addiction treatment programs in Warsaw, Poland. By means of self-report questionnaires (Barratt Impulsiveness Scale (BIS-11), NEO-Personality Inventory) and Stop-signal Task (a measure for response inhibition), impulsiveness among all patients was assessed. Blood samples for DNA isolation were collected. DNA samples were analyzed in respect of polymorphisms of genes involved in synthesis and activity of serotonin system (TPH2, 5HTTLPR) for associations with level of impulsiveness.

RESULTS: The genetic analyses showed that alcohol dependent patients with the L/L genotype in the 5HTTLPR gene polymorphism (higher 5HTT transcription activity) had higher BIS-11 total scores (p=0.040) and BIS Attentional Impulsiveness factor scores (p=0.0002) than patients with S allele (S/L or S/S genotypes - intermediate or lower 5HTT activity). Moreover, associations between the G/G genotype in TPH2 gene polymorphism and lower levels of response inhibition in the “Stopping Task” (p=0.036) and higher NEO impulsiveness facet scores (p=0.017) were found. CONCLUSION: Serotonin transporter and tryptophan hydroxylase genes polymorphisms are associated with the level of impulsivity among alcohol dependent patients.

DRINKING PATTERNS AND RELATED PROBLEMS AMONG ADULTS IN SÃO PAULO, BRAZIL: TEN-YEARS TRENDS

INSTITUTIONS

2. C M Silveira², PhD
3. Y-P Wang³, PhD
4. M C Viana³, PhD
5. A G Andrade¹, Professor Dr., MD, PhD

AIM: To compare and contrast epidemiological trends in drinking patterns and problems across a 10 year span.

METHODS: Two community probability sample surveys (São Paulo-Epidemiologic Catchment Area Study 1, data collection in 1995-6 N = 1,464; São Paulo Megacity in 2005-6 = 5,237) were conducted in the Sao Paulo metropolitan area, 10 years apart, with essentially the same assessment protocol and methods. The epidemiological estimates and comparisons are based upon these two independent samples of area residents, aged 18 years or more.

RESULTS: To illustrate the findings, there was an increasing trend in relation to heavy episodic drinking (interim analysis) increasing from 17.5% to 25%, in a 12-month period in lifetime. This increment is mainly due to the engagement of females in this pattern of drinking. In the first study, 10.9% of women reported heavy drinking, increasing to 17.8% ten years later, while heavy drinking rates for men remained stable with little variation across the years. There was a gender convergence in the amount of problems when heavy drinking patterns were considered, and this pattern remained stable in the period considered.

CONCLUSION: The pattern of drinking in São Paulo became more detrimental, mainly in women, with almost two-fold increment in heavy-drinking in this gender. These findings, which are now being used to help refine plans for public health action and alcohol treatment service improvements in Sao Paulo, highlight the importance of prevention actions addressed specifically for heavy-drinking at non-dependent level in both genders.
IS LEVEL OF GAMBLING PROBLEMS RELATED TO DECREASED USE OF COCAINE AMONG COMMUNITY RECRUITED WOMEN?

INSTITUTIONS
1. Washington University at Saint Louis, Psychiatry, Saint Louis, United States

AUTHORS
1. Linda B. Cottler¹, Professor, PhD, MPH, cottler@epi.wustl.edu
2. Arbi Ben Abdallah¹
3. Susan Bradford¹
4. Catina O'Leary¹

AIM: These data explore whether women with gambling problems are less likely to have reduced their crack-cocaine use at 4 and 12 months post-intervention in a large sample (n=450) of predominately African-American women recruited by street outreach for a NIDA-funded HIV prevention study (DA11622).

METHODS: All participants were women 18-67 years of age (mean 38.2±7.0); 49% had not completed high school nor GED, 43% had no paid employment in the past 12 months and 63% had never been legally married. All reported lifetime crack or cocaine use; 56% of users met DSM-IV diagnostic criteria for cocaine dependence. Gambling problem is defined as at least one positive symptom in DSM-IV criterion A for pathological gambling, which was present in 99 (22%) of the sample who reported 1-10 symptoms (mean: 3.7±2.6).

RESULTS: There was no difference between group means (Tukey) in frequency of crack/cocaine use at baseline. The 126 non-gamblers used crack/cocaine 8.5±10.8 of the last 30 days at baseline. The 225 asymptomatic gamblers used crack/cocaine 9.6±10.7 of the last 30 days at baseline, and the 99 problem gamblers 11.9±12.0 days. Rates of prior 30 days crack/cocaine use will be examined at 4 and 12 month follow-up periods for all three gambling groups. This sample will also be examined for any relationship between gambling and reduction in risky sexual behaviors such as sex trading and multiple sex partners.

CONCLUSIONS: Co-occurring gambling problems and cocaine use among women is an understudied topic; this study suggests some new directions and refinements for future research.

African Perspective
WPA Zone 14 Symposium

Psychiatry for the person is based on a comprehensive assessment of the life situation of a patient. It draws from scientific principles of evaluation and includes broad humanistic elements in determining the mental disease process afflicting the person. Management of the patient takes into account the belief system and cultural milieu that has shaped the individual’s development. In this context, African Psychiatry goes further to seek information from family, traditional healers and spiritual leaders who may have attempted to assist the index patient. Inclusion of these spheres of influence in the management of our patients is mandatory for a person centred approach. The following presentations are an effort to demonstrate psychiatric practice in Africa with reference to the use of scientific and humanistic approaches in evaluation and management of patients. The presentations will also contextualize the person centred approach in the day to day practice of Psychiatry in Africa with specific reference to cultural, social, economic, political, training and research domains.
PERSON CENTRED PSYCHIATRY: AFRICAN PERSPECTIVE: CULTURE AND PSYCHIATRY IN AFRICA

INSTITUTIONS
1. African Association of Psychiatry & Allied Professions, President, Nairobi, Kenya

AUTHORS
1. Frank Njenga¹, Dr, M.D, fnjenga@africaonline.co.ke

African culture is often stated to have a positive influence and impact on the outcome of disease in general and chronic mental illness in particular. In earlier studies on schizophrenia, developing countries were thought to show a more favorable outcome because of their greater social support systems, and less stigma to mental disorders. More recent and more rigorous studies do not support this view but the earlier findings nonetheless form a good starting point for discussion on the role of culture on mental health and disease. It is for example well known that Anorexia Nervosa is a common cause of morbidity in the west while its prevalence in Africa is virtually non-existent. What cultural factors are at play in this and other mental disorders is unclear. Conversion disorders were very common in many parts of Africa in the fifties and sixties. They have seen a steady decline in Africa over the last few decades. It is not clear if this is a cultural, social or medical change.

MENTAL HEALTH RESEARCH IN AFRICA

INSTITUTIONS
1. Butabika National Mental Hospital, Psychiatry, Kampala, Uganda

AUTHORS
1. Fred Kigozi¹, Dr, M.D, buthosp@infocom.co.ug

Mental and neurological disorders are responsible for 13% of the global burden of disease. In Africa as well, there is widespread recognition that mental disorders make a significant contribution to the burden of disease particularly with extra challenges resulting from the civil wars and their effects as well as the HIV/AIDS pandemic amidst very scarce resources. Despite this evidence, mental health is a neglected and an under-researched area of public health. Little is known regarding the mental health systems in African countries south of the Sahara desert, including the policy and legislation framework, mental services, human resources, monitoring and evaluation of the interventions.

As part of capacity building for research in Africa, a consortium of mental health professionals from four representative African countries undertook a broad 5-year research study that aims to analyse mental health policy development and implementation in low income countries, provide researchable interventions to assist in the development of implementation of mental health policies in those countries.

The aim of the study was to conduct a cross-sectional survey of mental health systems in four Africa countries with various levels of mental health service provision; Ghana, South Africa, Uganda and Zambia, using the World Health Organisation Assessment Instrument for Mental Health Systems (WHO-AIMS) version 2.2 and the WHO Mental Health Legislation Check List.

Preliminary results will be presented and discussed with suggestions for the implication in mental health care provision.
TRAINING OF PSYCHIATRISTS IN AFRICAN UNIVERSITIES

INSTITUTIONS
1. University of Limpopo (MEDUNSA), Psychiatry, Pretoria, South Africa

AUTHORS
1. Solomon Rataemane¹, Prof., MD, srataema@mweb.co.za

Training of Psychiatrists in African Universities is a difficult task considering the low level of interest in this specialty. There are few psychiatrists in almost all African states with some states surviving at one or no indigenous Psychiatrist. Psychiatically trained nurses, social workers and Psychologists do most of the mental health work. The next level is that of Medical Officers with limited exposure in Psychiatry but with some interest in taking care of the mentally ill. Such medical officers have a daunting task of advising nurses, psychologists and social workers. They may last have had exposure to Psychiatry at undergraduate medical training level. Innovative measures have to be adopted to increase knowledge about mental disorders; empowering medical officers with basic knowledge of psychiatry; encouraging medical officers to do a diploma course in psychiatry (where available) and increasing advocacy for postgraduate training posts in Psychiatry. This presentation will review existing programs and also highlight the complexity of training Psychiatrists in the African context.

PROBLEMS OF SUBSTANCE ABUSE IN AFRICA

INSTITUTIONS
1. Ministry of Health, Psychiatry, Kampala, Uganda

AUTHORS
1. David Basangwa¹, Dr, dbasangwa@utlonline.co.ug

Consumption of psychoactive substances comprises a serious public health problem that affects many people with a wide range of physical, social and psychological problems.

The United Nations office on Drugs and Crime (UNODC) estimates that the number of drug users worldwide is about 185 million. In Africa, drug abuse was initially limited to only traditionally produced substances like cannabis. However, of late the drug abuse culture has grown to include even the non-traditional products like heroin and cocaine. Factors that include civil strife, HIV/AIDS pandemic and the rampant culture of copying non-traditional life styles are probably responsible for the escalating problem.

While the different countries of the region are at different levels in this challenge, the overall picture is a source of concern.

The paper reviews the situation in some African countries and also looks at the strategies for control.

2. D.A. Martins1,2, Professor, MD

Aircraft maintenance system requires a high level of competency, is intolerant to errors, and is characterized by high levels of mental workload. This study examined the relationship between Work Stress (WS) and Quality of Life (QoL). Eight-two male aircraft maintenance workers of a Brazilian military institution answered two questionnaires (the ERI - Effort-Reward Imbalance and the WHOQol-bref). The occurrence of ERI was 33% (p=0.00), suggesting the existence of WS: Over commitment (OC) 10% (p=0.00). The WHOQol-bref: mean scores (12.4) on Environment Domain (ED) was significantly lower than the on other domains (p<0.05). Socio-demographic variables (SD) were not significantly linked to ERI and WHOQol-bref. (p>0.05). OC was significantly associated with income (p=0.05). The OC subscales were significantly linked to SD: competitiveness and working hours per week (p=0.01); latent hostility and income (p=0.02). Inability to withdrawal from work (IWW) was significantly correlated with income, age, level of occupation and shift work (p<0.02). MLR yielded that QoL domains (Physical Health domain (PHD), β=-0.05; ED, β=-0.04) accounted for 33.9% of the variance of ERI (p<0.05). ERI accounted for 28.3% of the variance of PHD and 24.7% of the variance of ED. These findings suggest that the perception of QoL is more related to organizational variables than worker's individual characteristics and mean that unfavorable organizational conditions can be a burden for military aircraft maintenance workers and when their adaptive energy begins to succumb, mistakes may occur thus becoming an important risk factor for the flight safety.
MENTAL HEALTH AND WORLD MINDEDNESS: TOWARDS A PSYCHOLOGICALLY SUSTAINABLE GLOBAL VILLAGE.

INSTITUTIONS
1. University of South Australia, School of Psychology, Adelaide, Australia

AUTHORS
1. Jacques Metzer, Associate Professor, PhD, Jack.Metzer@unisa.edu.au

Rapid work and social changes and the emergence of new technological societies have brought favourable developments to many parts of the world, but have not come without mental health costs. From Karoshi and Karojisatsu in Japan to work burnout, family conflict, social alienation and unemployment in other parts of the world, together with epidemics of anxiety and depression in many developed nations, indicate the negative aspects of demands for instant communication and the “do by yesterday” phenomenon. In the 1970s, Toffler predicted that we would have to live in a society which expected constant and rapid change; he termed the result on people, “future shock”. In this paper, it is argued that many old ideological and unresolved social conflicts would resurface and thrive under the conditions of future shock: racism, religious intolerance, economic domination by multinationals, authoritarian governments and wars for dominance over dwindling resources. In a technologically sophisticated society with excellent communication, work and social life would be increasingly dominated by such unproductive global movements and take their toll on mental health. It is also argued that there are countermeasures at an individual level which can be taken to arrest these divisive social forces: they constitute the psychological constructs of world mindedness, connectedness and sustainable living. Some examples from the psychological literature are cited and discussed.

MENTAL HEALTH IN SMALL ORGANIZATIONS IN JAPAN

INSTITUTIONS
1. Kyoto Bunkyo University, Clinical Psychology, Kyoto, Japan

AUTHORS
1. Satoru Shima, Professor, MD, PhD, Shima@iomhj.com

One of occupational mental health disparities is the size of organizations. In general mental health system is better in a large organization than in a small organization. It would be the same case for the levels of mental health in their employees. Accordingly we conducted a survey on mental health and employees’ mental health status focusing on suicide in several small organizations as a part of an intervention study. Subjects consisted of 2,890 employees in 87 organizations. We administered a set of questionnaires to employers as well as employees to ask a current mental health system, their needs, and employees’ mental health status. Although 72.7% of employers thought they had better implement a mental health system, only 23.6% had a system. During the last 12 months, 7.3% of organizations had experienced suicidal cases. Also, 10.3% and 2.2% of employees had experienced suicidal ideas and had committed suicidal behaviors respectively. Employing the CESD as an indicator of depression, 25.6% of employees were regarded as depressive. Those figures indicate that small organizations are facing serious mental health problems and that they need support from professional bodies in order to implement effective mental health system.
WORK-RELATED STRESSORS: DIFFERENCES AMONG BRAZILIAN MALE AND FEMALE WORKERS

INSTITUTIONS
1. International Stress Management Association in Brazil, Porto Alegre, Brazil

AUTHORS
1. Ana Maria Rossi¹, Chair, PhD, stress@ismabrasil.com.br

Objectives: To identify the perception of professional men and women from two large cities in Brazil regarding the sources of stress at the workplace.

Methods: A sample of 600 workers was randomly selected from three large nationwide organizations in two large cities in Brazil. The subjects selected answered a two-folded questionnaire: (1) question one listed 12 work stressors and asked participants to identify those situations that caused them the most stress at work (2) a follow-up question asked them to rank those they had identified based on the number of problems the situations had caused in accomplishing their work in the past 30 days.

Results: The results indicate that there is a general agreement on the most dysfunctional causes of work-related stress. However, there are some differences between the perception of males and females workers in terms of sources of occupational stress.

Conclusions: The study suggests that Brazilian male and female workers experience occupational distress which in turn limits their effectiveness in performing their jobs mainly regarding their productivity. It extends the claim that work-related stressors impact on the workers’ well-being as well as on their performance at work and that every effort should be made to reduce occupational stress.

THE ASSOCIATION OF WORK STRESS WITH WELL-BEING IN RELATION TO LIFE ASPIRATIONS

INSTITUTIONS
1. Semmelweis University, Institute of Behavioural Sciences, Budapest, Hungary

AUTHORS
1. Gyöngyvér Salavecz¹, Dr, salavecz@freemail.hu
2. Tamás Martos¹, Dr, MD
3. Maria Kopp¹, Dr, MD, kopmar@net.sote.hu

Research Question: The aim of this study was to analyse the association of work stress with well-being in relation to intrinsic (e.g. personal growth and relationships) and extrinsic (e.g. financial success and appearance) life aspirations.

Methods: The economically active sample was taken from the Hungarian Study Epidemiological Panel 2006, which is a cross-sectional sample representing the Hungarian society in gender and age (n=2100). Work stress was measured by the shortened version of the Effort-Reward Imbalance (ERI) questionnaire, life aspirations by the Shortened Aspiration Index and well-being by the WHO Well-being Scale. Binary logistic regression adjusted for sex, age and education attainment was used to determine the effect of work stress on well-being.

Results: The results showed higher ERI and over commitment significantly predicted lower well-being (OR=2.1-2.4; p<0.01). Significant interactions between work stress and life aspirations were found on well-being (p<0.01). Those who reported both high work stress and more intrinsic aspirations had higher chance to have lower well-being (OR=3.3; p<0.01) compared to those who had work stress and mainly extrinsic aspirations.

Conclusions: The results suggest that work characteristics are much more relevant to well-being among employees with intrinsic aspirations. Workers with intrinsic life aspirations may have more emotional investment in their work, leading to stronger effects of work stress on well-being. This finding is somewhat in contradiction with previous findings and indicates that workers with predominantly intrinsic life aspirations may be more prone to suffer from negative effects of the actual work setting.
A STUDY OF 66 WORKPLACE HARASSMENT CASES FOR WHICH WORKERS’ COMPENSATION WAS CLAIMED FOR UNDER THE INSURANCE SYSTEM

INSTITUTIONS
1. Sakura Medical Center, Toho, Psychiatric Medicine Research Department, Narashino, Japan

AUTHORS
1. Norio Kuroki, Professor, MD, PhD, nkuroki@ca.mbn.or.jp

In Japan, power-related harassment has been defined by Yasuko Okada as: “harassment that is backed by official power, verbal abuse and unacceptable behavior and actions by people in positions of authority and power over other employees; creating an emotionally and physically unbearable working environment and making the employee anxious about his/her employment status.” However, its contents, degree, and background seem to vary case by case. According to The Labor Bureau’s guidelines for determining whether accidents were caused by work-related mental disorders, workplace harassment is categorized as “relationship problems,” and actually corresponds to “problems with the boss (or a colleague)” and “sexual harassment.” The following are the results of a study involving 337 cases I studied for which workers’ compensation had been applied for during a 5-year period from September 2002 through August 2007: 1) There were 87 cases of suicide-related applications, of which 29 were accepted and 58 were rejected. On the other hand, there were 250 cases of mental disorder-related applications, of which 37 were accepted and 213 were rejected. 2) Applications filed based on suicides attributable to power-related harassment accounted for 14% (4 cases) of the 29 accepted cases of suicide-related applications. 3) Applications filed based on suicides due to problems with the boss or other employees accounted for 7% (4 cases) of the 58 rejected cases of suicide-related applications. 4) Among the 37 accepted cases of mental disorder-related applications, 6 (16%) were considered to be associated with power-related harassment. 5) Among the 213 rejected cases of mental disorder-related applications, 64 (30%) were attributable to problems with the boss.

At the congress, I will report a detailed analysis of cases of relationship problems with some speculations.

DISPARITIES IN WORK-RELATED STRESS BETWEEN OCCUPATIONS AMONG JAPANESE WORKERS

INSTITUTIONS
1. Tokyo Medical University, Department of Preventive Medicine and Public Health, Tokyo, Japan
2. Toshiba Corporation, Yokohama Factory, Health Promotion Center, Yokohama, Japan

AUTHORS
1. Teruichi Shimomitsu, Professor, MD, PhD, tshimo@tokyo-med.ac.jp
2. Yuko Odagiri, Associate Professor, MD, PhD
3. Yumiko Ohya, Dr., PhD
4. Toshio Hayashi, Dr., MD, PhD

The number of karoshi (death by overwork) and karojisatu (suicide by overwork) is increasing in Japan. According to the 2006 Government report, the number of work compensation of psychiatric disorders was 205 which has dramatically increased by 61.4% compared with the number of the previous year. If the number of claims was included, it was 819 and also showed an increase. The prevalent occupation of the sufferer was professional/technical occupation (29%) such as system engineer. According to this report, it is clear that disparities regarding mental health exist between occupations in Japan. We conducted a study to compare the scores of stress reactions including depression, irritability or fatigue etc., as well as work-related stressors and social support using Brief Job Stress Questionnaire for 3 occupations, professional/technical, service/sales, and skilled trade. The numbers of subjects in each occupation were 1682, 9544, and 1971, respectively. The results showed that the subjects in professional/technical occupation had higher mean scores of depression, somatic stress responses, qualitative demands, control and lower social support from supervisors and colleagues compared with other two occupations. Multiple regression analysis by occupation revealed control was strongly negatively related to anxiety or depression only among professional/technical occupation. This means that among professional/technical occupation, control is generally higher compared with other occupation, however, if it is low, it has a negative impact on depression or anxiety. These results indicate that we have to focus on mental health disparities among occupations and pay attention to specific stressors of targeting occupation when considering countermeasures.
**SECTION SYMPOSIAS**

**DELIVERING RACE EQUALITY IN MENTAL HEALTH SERVICES**

**INSTITUTIONS**
1. North East London Mental Health Trust, London, United Kingdom

**AUTHORS**
1. Annie Lau¹, Dr., ND, PhD, Annie.Lau@nelmht.nhs.uk

"Delivering race equality in mental health care", DRE, January 2005, is a five year action plan for tackling inequalities and discrimination in mental healthcare for Black and Minority Ethnic (BME) users and communities, and based around three main building blocks: 1. More appropriate and responsive services. 2. Community engagement, through engaging communities in planning services. This was to be supported by new funding for Community Development Workers. 3. Better information, from improved monitoring of ethnicity, and an annual census of mental health patients. The case for clinical engagement How can psychiatrists and their teams most usefully engage with this agenda in a way that is relevant, creative and meaningful? There has been much heated debate in the profession, with regards to whether or not psychiatrists are institutionally racist, and where the fault lies with regards to poor access, and experience, of mental health services by BME patients and their families. New opportunities are to be found for clinical engagement in the following areas. 1. Improving access 2. Influencing informed PCT commissioning of services 3. Early Intervention in Psychosis services (EIP) 4. Improving access to talking therapies/safe inpatient environments 5. The forensic care pathway 6. Involving patients and carers. 7. Findings from new research

This presentation will also include good practice examples.

Over the last several decades great advances have occurred in the development of effective treatments for mental illnesses. However, there are significant issues with the access to care and frequently the care that is delivered does not include the treatments that have been shown to be effective. This symposium will focus on five quality improvement initiatives that address these issues.

The initial presentation presents recent results in benchmarking focusing on schizophrenia, depression and alcoholism at nine psychiatric hospitals in Germany. The 2nd presentation reports on a current study in the United States of patients who have died while in restraints. Several issues have been identified. The 3rd presentation focuses on the development, dissemination and use of evidence-based practice guidelines. The challenges and new initiatives in this area will be explored. The 4th presentation focuses on a train-the-trainer model of expanding an initiative in Iceland to decrease the incidence of suicide. The 5th presentation looks at learning collaboratives in California that promote practice change and transformation of systems by enhancing the quality improvement capacity and infrastructure at the local level.
BENCHMARKING IN CLINICAL PSYCHIATRY: CONCEPTS, METHODS AND RESULTS

INSTITUTIONS
1. Heinrich-Heine-University Düsseldorf, Department of Psychiatry and Psychotherapy, Düsseldorf, Germany

AUTHORS
1. Wolfgang Gaebel1, Professor, MD, wolfgang.gaebel@uni-duesseldorf.de

Benchmarking is a well-established method for quality management in somatic medicine, however rarely applied in psychiatry. Besides administrative reasons, this is mainly due to problems in operationalizing and evaluating quality indicators, and their implementation into clinical practice.

In Germany, the Federal Ministry of Health (BMG) initiated 10 benchmarking projects, two of them in psychiatry. In one project, 9 psychiatric hospitals of the Rhineland Regional Council (‘Land- schaftsverband Rheinland’; LVR) developed and implemented quality indicators enabling benchmarking as part of a comprehensive quality management strategy. The main objective was to assess the effects of benchmarking on outcome quality indicators at the end of the inpatient treatment period.

We documented more than 300 treatment processes in three diagnostic groups (alcoholism, depression of the elderly and schizophrenia). Comparing the outcome quality indicators before and after implementing benchmarking procedures, we observed effects of the intervention for both single hospitals and the overall sample.

Conclusion: Benchmarking is a feasible and effective procedure for quality management in psychiatry.

A STUDY OF DEATHS IN RESTRAINTS: LESSONS LEARNED

INSTITUTIONS

AUTHORS
1. J. Richard Ciccone2, Professor, MD, rciccone@rochester.rr.com

Equip for Equality, located in Illinois, USA, is part of the federally mandated Protection and Advocacy System that is charged with protecting the rights and safety of people with physical and mental disabilities. In 1998, a report documented 142 restraint deaths had occurred in the previous ten years. To better understand the causes of restraining deaths and develop “best practices” policies and procedures to reduce the risks and mortality associated with restraints, Equip for Equality undertook a national review of restraint related deaths. A study was designed to explore the relationship between restraint and individual deaths, the degree to which application of the intervention met applicable standards, and the specific risks with the use of restraints in each instance. Data has been systematically collected and a number of interesting themes have emerged. The data and several recommendations regarding reform of restraint policies and practices will be discussed.
FROM RESEARCH TO PRACTICE: RECENT INITIATIVES IN PRACTICE GUIDELINES

INSTITUTIONS
1. Unity Health System, Psychiatry and Behavioral Health, Rochester, NY, United States

AUTHORS
1. John S McIntyre, Professor, MD, jm McIntyre@unityhealth.org

Great advances have occurred in the development of treatments that are effective for mental illnesses. However, many patients do not receive these evidence-based treatments. Practice guidelines are evidence-based patient care strategies developed to assist physicians in clinical decision making. The American Psychiatric Association Practice Guideline project, now nearing its 20th year of operation, has published 14 different guidelines (and seven revisions). Several challenges exist including the effective dissemination of the guidelines, keeping the guidelines current, developing recommendations in areas where the research data is not robust, attending to issues of cultural and ethnic differences, addressing individual patients goals and preferences and dealing with real or perceived conflicts of interest in the development of the guidelines. This presentation will focus on strategies to address these 6 challenges.

TRAIN THE TRAINER: RESULTS OF AN ICELANDIC PUBLIC HEALTH INITIATIVE

INSTITUTIONS

8. S. Gudmundsson

Aims/Objectives
To train healthcare professionals and community facilitators to educate professionals and lay people about depression and suicide risk, and assess the impact of training.

Methods
The project is part of a European depression and suicide prevention program. In 2003-6 a nation-wide education program was run for over 3000 professionals in primary healthcare, social services, school systems, clergy and police. A public education campaign and out-reach to high-risk groups was initiated. Starting in 2006, 17 workshops with 250 participants were conducted, including those mentioned above. A survey was performed at the end of each workshop and a follow-up focusing on the experience of the participants in the ensuing six-months.

Results
Due to contact difficulties the follow-up relied on feedback from key persons in each of the workshops. The general consensus was that the workshops were useful. Participants used their experience and our DVD education material to train their co-workers; working with difficult clients had become easier; our approach to include in each workshop participants facilitated later collaboration, particularly in rural communities. Need was expressed for specific education and training and for follow-up training.

Conclusion
The Train the trainer workshops have had a significant impact on the behavior of professionals working with difficult clients. The workshops need to be more tailor-made for specific needs and regular follow-up education may be needed to sustain the impact.
LEARNING COLLABORATIVE: INNOVATIVE APPROACHES TO BUILDING QI CAPACITY AND SUSTAINED CHANGE

INSTITUTIONS
1. California Institute for Mental Health, Special Projects, Sacramento, United States

AUTHORS
1. Neal Adams1, Dr., MD, nadamsmd@gmail.com

Aims/Objectives Many studies in the US and other countries have established the urgent and compelling need to dramatically reform mental healthcare delivery systems and improve the quality of care provided. However, achieving the necessary changes is proving to be difficult and many systems lack the quality improvement infrastructure and ability to succeed in creating sustainable change that improves the process and outcomes of care. Learning collaboratives in the general health sector have become an established strategy for change that has had little application to mental health systems/practice change. This study examines the potential of a learning collaborative to promote transformative change in the California public mental health system.

Methods Eight county mental health programs participating in a 20 month learning collaborative in which each county initiated a local change initiative consistent with the quality aims identified in the Institute of Medicine’s quality chasm report in order to build QI infrastructure, develop innovative change strategies and find methods to diffuse successful change.

Results The counties reported a high level of satisfaction with their participation in the learning collaborative along with developing overall QI/change management capacity and had considerable success in completion of their individual local projects.

Conclusion Learning collaboratives adapted for public mental health systems offer a promising approach towards fostering and supporting much needed systems/practice level change and supporting transformation.

PHILOSOPHICAL RESOURCES FOR PSYCHIATRY FOR THE PERSON

INSTITUTIONS

THE PHILOSOPHY OF PSYCHIATRY SECTION SYMPOSIUM

The World Psychiatric Association’s ongoing Institutional Program for Psychiatry for the Person raises philosophical issues alongside clinical and empirical matters.

The WPA’s programme coincides with a period of flourishing of the philosophy of psychiatry with both philosophers and psychiatrists (and others) examining the conceptual foundations of mental health care. This symposium considers some philosophical resources which may help develop a psychiatry for the person.
A SECRET HISTORY OF ICD AND THE HIDDEN FUTURE OF DSM

INSTITUTIONS
1. University of Central Lancashire, Institute for Philosophy, Diversity and Mental Health, Preston, United Kingdom

AUTHORS
1. KWM (Bill) Fulford¹, Prof, MD, PhD, k.w.m.fulford@warwick.ac.uk

The development of symptom-based classifications has been widely attributed to a ground-breaking report by the English psychiatrist, Irvin Stengel, to the WHO in the early 1960s. In fact, behind Stengel’s report is a secret, or at any rate largely forgotten, history in which Aubrey Lewis and Norman Sartorius have leading roles.

In this paper I describe this secret history of the ICD and outline some of its implications for understanding both where we have got to with current psychiatric classifications and also their future development in the early years of the 21st century. These implications relate particularly to: 1) methodology – the need for a two-way working relationship between philosophy and psychiatry, 2) the role of the philosophy of science - Hempel’s logical empiricism modelled on physics was hugely fruitful for psychiatry and we need to build similarly on models particularly of validity derived from the physical sciences (e.g. in the work of Arthur Fine), 3) the role of philosophical value theory - Lewis’s careful restriction of symptom-based classifications to the particular purposes of epidemiology and statistical reporting leaves the door wide open for other approaches to classification for other purposes, and the importance of this in the clinical context is illustrated by the ways in which values come into such areas as judgements of clinical significance, and, 4) the overall shape of future diagnostic classifications in psychiatry as forming a family of classifications rather than any one classification becoming dominant.

PSYCHIATRY AND THE PERSONAL DIMENSION

INSTITUTIONS
1. University of Florence, Department of Philosophy, Florence, Italy

AUTHORS
1. Carlo Gabbani¹, Dr, PhD, c.gabbni@tiscali.it

The relationship between the personal level and the sub-personal levels of analysis of our mind is a classic topic in the philosophy of mind. In my paper I deal with the relevance of the debate concerning the personal dimension and the common sense psychology for psychiatry. My analysis will be developed from an epistemological point-of-view.

I will argue for the thesis that (also) for psychiatry a kind of autonomous, personal level of analysis is essential. And conscious phenomena, that can make a difference, and have a genuine and original relevance in our causal explanations, really are on view only adopting a personal level perspective. Personal and sub-personal levels of analysis, therefore, seem in principle not to be reducible to each other (while at the same time they are complementary).

I will also try to discuss the contrast between the reference to this personal level of analysis, and the projects whose aims are to produce a completely naturalized and physicalistic psychiatric knowledge (that is, a type of knowledge which is based on the reference to sub-personal agencies and modules alone).

I hope in this way to show that the defence of the personal dimension and the common sense psychology, is associated with a certain kind of interpretation concerning the nature and the locus of mental disorders, and the proper correlates of psychiatric taxonomies. For this reason, I will also examine how having a personal level of analysis may influence the debate regarding the validity of our actual and/or possible psychiatric nosographies.
EMPATHY AND PSYCHIATRY FOR THE PERSON

INSTITUTIONS
1. University of Central Lancashire, Institute for Philosophy, Diversity and Mental Health, Preston, United Kingdom

AUTHORS
1. Tim Thornton¹, Prof, PhD, tthornton1@uclan.ac.uk

According to Karl Jaspers, founder of modern psychopathology, empathy lies at the heart of psychological psychiatry. His brisk account suggests that it amounts to more than mere access to other minds and includes an element of identification. In this paper, I examine the model of empathy that would make it both substantial and central to psychiatry.

One model that appears to fit the bill is simulation theory from recent philosophy of mind which connects knowledge of other minds to a form of imagination and hence identification with others. But in this paper I consider an alternative which I believe is more plausible on independent grounds (although I will not argue for that here).

I argue that the model of access to other minds via the experience of their behavioural expression is also a form of empathy because it presupposes a substantial background condition. The expression of others’ mental states can only ground an experience incompatible with the absence of their mental states in those with not only the right mental state concepts but also a shared background of natural expressions and reactions. This includes not only expressions of mental states (looking ‘inwards’) but also (looking ‘outwards’) shared reactions to evaluative aspects of the social world. Although not Jaspers’ own, this model would help explain the central role of empathy for an approach to psychiatry for the person that is sensitive to the role of values in mental health care.

INTERNATIONAL GUIDE TO USING PSYCHOTROPICS IN INTELLECTUAL DISABILITIES

INSTITUTIONS
1. University of Birmingham, Department of Psychiatry, Birmingham, United Kingdom

AUTHORS
1. Shoumitro Deb¹, Clinical Professor, MBBS, FRCPsych, MD, s.deb@bham.ac.uk

The aim of the symposium is to introduce an international guide to using psychotropic medication to manage behaviour problems in adults with intellectual disabilities. The guide has been adapted from a national guide in the United Kingdom. Furthermore, perspectives from different continents will also be discussed.
A GUIDE TO USING PSYCHOTROPICS IN INTELLECTUAL DISABILITY

INSTITUTIONS
1. University of Birmingham, Division of Neuroscience, United Kingdom

AUTHORS
1. Shoumitro Deb1, Professor, MBBS, FRCPsych, MD, s.deb@bham.ac.uk

Aims: To develop an evidence and consensus based international guide to using psychotropic medication for the management of behaviour problems among adults with intellectual disabilities (ID).

Methods: The current guide is adapted from the UK guide. A Guideline Development Group (GDG) comprising a multi-professional team was established for the UK guide. The GDG examined all the literature based evidence for the effectiveness of medications for the management of behaviour problems among adults with ID. A consensus was obtained by consulting a large number of psychiatrists in the field of ID in the UK and a number of stakeholder organisations. The carer’s perspective and the input from the adults with ID were provided directly to the GDG.

Results: Some important recommendations are that a) the individuals with ID and their carers should be central to the decision making process, b) where appropriate an interdisciplinary approach should be taken to decision making, c) all management options including the use of medication should be considered simultaneously, d) an appropriate assessment of the behaviour, its causes and effects should be carried out prior to initiating treatment, e) The outcome and adverse effects, particularly the impact on the person’s quality of life should be monitored regularly using objective methods.

Conclusion: On the basis of the current evidence it is not possible either to recommend or to refute the use of psychotropics for the management of behaviour problems among adults with ID but certain safeguards should be put in place if medication is considered. www.ld-medication.bham.ac.uk

PSYCHOPHARMACOLOGY IN ADULTS WITH INTELLECTUAL DISABILITIES: AMERICAN PERSPECTIVE

INSTITUTIONS
1. University of North Carolina School of Medicine, United States

AUTHORS
1. Jarrett Barnhill1, Professor, MD, DFAPA, FAACAP

Aims: To review trends in the United States affecting psychotropic use for individuals with intellectual disabilities.

Methods: There are many state and federal regulations affecting psychotropic use in the United States. These regulations are based on the level of intellectual disability, severity of challenging behaviors, co-occurring mental disorders, setting of care provision, and source of funding. For most, the regulation stipulate: a thorough behavioral analysis; psychiatric assessment; quarterly reviews to determine and quarterly reviews of the efficacy, safety, and continued need for medication. Unfortunately the rapid changes in clinical neuropharmacology frequently outpace the ability of regulatory agencies to adapt reasonable safeguards.

Results: The lack of a national health insurance program impacts individuals with ID. Private insurers provide a portion of care for many middle class Americans but are less helpful for individuals with chronic disabilities or for 40 million Americans unable to afford coverage. The majority are covered by federal-state programs for the elderly, disabled and low income individuals, mostly Medicare and Medicaid. But there is a growing trend to contain costs of these cost programs by limiting services, creating medication formularies, limiting payments on medications not approved by the Food and Drug Administration (off-label use), and reducing payments to health care providers.

Conclusion: Without a national health care system in the US, rising costs may limit the flexibility of clinicians to provide state of the art treatment to individuals with intellectual disabilities. Trends towards cost containment by federal-state programs may eventually limit access to rapidly expanding advance in neuropharmacology.
PSYCHOPHARMACOLOGY IN ADULTS WITH INTELLECTUAL DISABILITIES: HONG KONG PERSPECTIVE

INSTITUTIONS
1. Kwai Chung Hospital, China

AUTHORS
1. Henry Kwok¹, Dr, kwokwmh@ha.prg.hk
2. E Chui¹, kwokwmh@ha.org.hk

Aims: To describe and examine the pattern of utilization of psychotropic medication for treatment of problem behaviours.

Methods: The Psychiatric Unit for Learning Disabilities in Kwai Chung Hospital, Hong Kong, is a specialist unit providing mental health care for people with intellectual disabilities above age 16. Problem behaviour is the commonest reason for seeking treatment at its out-patient clinic. The subjects of the study consisted of out-patients under active medication treatment for such problem behaviours. A simple checklist was designed for data collection. All the medication prescriptions were retrieved from the computer database and analyzed.

Results: The different classes and dosages of psychotropic medication prescribed would be presented. Factors affecting the prescription pattern would also be explored.

Conclusion: The rate of using psychotropic medication for the treatment of behaviour problems is high. Since the evidence base for the effectiveness of these medications is not yet conclusive, guidelines should be developed and implemented to ensure that medications are used appropriately for each individual under the best clinical practice.

PSYCHOTROPIC MEDICATION AND INTELLECTUAL DISABILITIES: CANADIAN PERSPECTIVE

INSTITUTIONS
1. Surrey Place Centre, Toronto, Canada
2. University of Toronto, Department of Psychiatry, Toronto, Canada

AUTHORS
1. Elspeth Bradley¹,², Professor, MBBS, PhD, FRCPC, e.bradley@utoronto.ca

Aims: To survey Canadian patterns of psychotropic medication utilization and service developments in response to complex needs.

Methods: Review of Canadian research, clinical practice and service developments.

Results: Most persons with intellectual disabilities in Canada now grow up in their own communities, access generic health services with the family doctor being the first point of access. Few physicians are trained specifically to work in this area and increasingly there is much reliance on informed care providers working collaboratively with generic health services to identify and address special needs. The emergency room is often the first point of contact to manage behavioural problems and Canadians with intellectual disabilities continue to be over medicated, yet remain under-treated. The decision to medicate is complex being influenced by many factors (including knowledge and training of physicians, absence of alternative approaches) and embedded within social, cultural and other considerations. Across Canada there is increasing recognition that complex health needs are best served by building capacity in local communities through interdisciplinary approaches. Specialized training and standards of care are developing through National and Provincial networks of concerned clinicians, researchers and consumers. Canadian Primary Care Guidelines for Adults with Intellectual Disabilities are now available.

Conclusion: There is a need in Canada for medication guidelines that include careful consideration of the complex circumstances that result in a decision to medicate. Guidelines that include an on-going process that considers risks and benefits of such decisions from individual, system and other perspectives might ensure that individual needs are optimally addressed.

HUMAN SEXUALITY has been and still remains in obscure, myths and false beliefs despite enormous and sensationalistic news and views. After 1998 the field changed. Sexual Medicine appeared and other medical disciplines took over the main areas. Psychiatry, at the beginning developed the main stream, but for many reasons that will be discussed abandoned the field. WPA, since 1999 (WPA Hamburg) developed successfully a Sexual Health Educational Program under the leadership of Prof Juan E Mezzich, and a Section was formally created. Many Congresses, Courses, Workshops, and Symposia has been presented worldwide. We will update in a Symposium format the knowledge base and with a difference in perspectives will present to the audience new issues and the future of this crucial area. Attitudes of caretakers of nursing homes towards the sexuality of older residents, Statistics regarding services of sexual health clinics. The importance of religions in sexuality concepts and the relevance of chronic pain in human sexuality will be reviewed.

ATTITUDES OF CARETAKER’S OF NURSING HOMES TOWARDS THE SEXUALITY OF OLDER RESIDENTS

INSTITUTIONS
1. Faculdade de Medicina da Universidade do Porto, Psiquiatria, Porto, Portugal

AUTHORS
1. Jacinto Costa Azevedo1, Dr., jacintoazevedo@gmail.com
2. Antonio Pacheco Palha1, Dr., Phd, psiquiatria@med.up.pt

There is a paucity of research in attitudes of care staff in residential homes regarding sexuality and older people in Portugal.

Aims: to investigate the attitudes of care staff in residential homes regarding resident’s sexuality.

Design: A descriptive questionnaire survey using the attitudinal part of Aging Sexual Knowledge and Attitudes Scale (ASKAS). Participants and setting: care staff in all residential homes in Porto city

Results: So far 126 valid research questionnaires were return giving a response rate of 62%; only 1% of total staff has some specific formation on sexuality; 66% of staff are care assistants, the mean total ASKAS score was 60 which reflects moderately positive and permissive attitudes toward later life sexuality. There was no difference in ASKAS score between doctors and nurses; doctors and nurses were more positive and permissive than care assistants (p<0.001). So far having little experience working with older people was predictive of positive attitudes (p<0.001) and age showed a positive correlation with ASKAS score (p<0.001), reflecting more negative and restrictive attitudes towards later life sexuality, as care staff are older and have more years of experience working in the field.

Conclusions: A young age and less than 5 years working experience with older people are predictive of more positive and permissive attitudes towards later life sexuality in this sample. Doctors and nurses have more positive attitudes than care assistants. Later life sexuality should be included in all educational and training programmes for care staff in residential homes.
SEXUAL HABITS IN MEDICINE FEMALE STUDENTS IN A EUROPEAN COUNTRY

INSTITUTIONS

4. Fina Antón-Ruiz3, Mrs, PhD
5. Sonia Tirado-González3, Mrs, PhD
6. José M de la Fuente4, Dr, MD

Aims/Objectives
In this study it has been evaluated the usage of contraceptives and how sexual processes like excitation, satisfaction and having an orgasm could be influenced by some variables such as: having a steady relationship, kind of practised sexual activity, possible diagnosed illnesses, sexual appetite, and relevant others

Methods
For this purpose, 114 young female university students were given the FSQ questionnaire, whose answers were studied. The average is 20.6 years (s 0.95) The FSQ “Feminine Sexuality Questionnaire” is a self-administrated 34 items original questionnaire.

Results
The results obtained with SPSS statistical analysis reveal some relevant aspects, for instance the fact that male condom is the most common contraceptive method and that “having more frequent sexual intercourse” and “increasing their capability to have an orgasm” are two aspects that they would like to change the most in their sexual lives.

Conclusion
As a conclusion, it could be said that some statements, such as the existing positive relation between using condoms and having a non-steady/lasting relationship or between using the pill and having a steady relationship -which were so defended in former studies- were not so significative in this sample.

PREVALENCE OF SEXUAL DISORDERS IN A THIRD WORLD COUNTRY POPULATION

INSTITUTIONS
1. Autonomous University of Santo Domingo, Institute of Human Sexuality, School of Medicine, Santo Domingo, Dominican Republic

AUTHORS
1. Rafael Garcia1, Dr., MD, PhD, raf.garcia@codetel.net.do
2. Cesar Mella1, Dr., MD, cesarm2@codetel.net.do
3. Ramon Almanzar1, Mr., Msc., inst.sex.humana@codetel.net.do
4. Antonio E. De Moya1, Mr., MSc., MPH, inst.sex.humana@codetel.net.do

Objectives: To identify and classify the sexual disorders of a population that requested services at the Institute of Human sexuality in the Dominican Republic.

Method: The Clinical history of 4,501 patients was analyzed to determine the reasons for referral to the clinic. The sample contained 2,581 (57.3) males and 1920 (42.6%) females. AI clients were evaluated and treated by a sex therapist, but other professional of the multidisciplinary team could be involved in the intervention.

Results: Sample of female excluded 298 cases with depression. In the remaining 1622 anorgasmia was overrepresented with 641 (39.5%) followed by 427 (26.3%) conflicts with the spouse, 251 (15.4%) hyposexual sexual desire, 77 (4.7%) had vaginism, 74 (4.5%) requested sexual education, 152 (9.3%) presented other diagnosis. The male sample excluded 75 depressed cases. In the remaining 2581, imposterance was overrepresented 1,055 (40.8%) followed by 959 (37.1%) praeox ejaculators, 142 (5.5%) conflicts with the spouse, 75 (2.9) with hyposexual sexual desire, 77 (2.9%) sexual identity disorder, 41 (1.5%) retarded ejaculation, 232 (8.9%) had other diagnosis. Low sexual desire and depression were more common in females than in males but sexual identity disorders are by far more common in males than females.

Conclusions: Prevalence of sexual disorders seems to be equally distributed in developed as well as underdeveloped countries. Sexual desire disorder seems to be lower but not absent. Physician should be aware that sexual problems are highly prevalent in all cultures (1).

POLITICAL VIOLENCE- AN OVERVIEW ON THE PRESENT STATE OF KNOWLEDGE AND RECENT DEVELOPMENTS

INSTITUTIONS
1. Medical University of Vienna, Austria, Social Psychiatry, Vienna, Austria
2. WPA, Toronto, Canada

AUTHORS
1. Thomas Wenzel¹
2. Federico Alldi², MD, fallodi@pobox.com
3. Fabian Friedrich¹, Dr., fabian.friedrich@meduniwien.ac.at
4. Nieves Molinas Clemente², drthomaswenzel@web.de

Political violence can be seen as a growing problem- and also of a problem with growing awareness of the involved social, medical and psychiatric risks. Psychiatric risks and impact affect not only the victim and survivors, but also the social environment- family members up to third generation effects.

The presentation - that will introduce the subject of the section sponsored symposia -summarizes the development of the field since the last world conference on Psychiatry and the activity of the WPA section during that period.

Developments include the more complex understanding of social and biological factors mediating the impact of violence.

Some areas, such as suicidality, and the impact of social psychological factors - have been explored insufficiently so far, reasons and implications of that limitation of the present knowledge will be explored in the presentation. Reconciliation and justice as signs of the reconfirmation of standards and the "contracte social", and the dignity of -often defamed victims - against impunity - can be exemplified in situations such as the Narjing massacres or Abu Ghraib.

THE CORBERI INSTITUTE: A NEW REHABILITATIVE PROJECT.

INSTITUTIONS
1. Corberi Institute, Mental Health, Limbiate, Italy

AUTHORS
1. Gabriele Rocca, Dr., MD

Aims: The Corberi Institute is a rehabilitative hospital situated in the northern suburbs of Milan, which started its activity in the sixties. Anybody with intellectual disabilities and psychiatric disorders under the age of 18 was admitted there. In the last fifteen years admissions and discharges have consistently decreased and now 160 adult patients are permanently in the institute. Here I present a new rehabilitative program with two goals:
1) Reorganize the assistance to people who had been there for a long time.
2) Organize a new service for adult patients with intellectual disabilities and psychiatric disorders.

Methods: From December 2006 to March 2007 an epidemiological and clinical study about all the patients was realized. A multiprofessional team collected the following information: socio-demographic data, diagnosis, social and psychological abilities, IQ, family situation, drug treatments, present rehabilitative interventions, quality of relationship between staff and patient's relatives.

Results: Based on the results of the study which will be shown, new activities have been implemented:
- Training course for all the members of the staff (about 200 people).
- Opening of a Day Centre for rehabilitative projects for people between 18 and 35 years old who live with their families.
- Opening of centre for out-patients where a multiprofessional team (Psychiatrists, a psychologist, a Social worker, Nurses) works.

Conclusions: The project is in progress and the proposal for the new residential facilities will be presented.

REBALANCING CARE ACROSS EUROPE: ECONOMIC CHALLENGES AND OPPORTUNITIES

INSTITUTIONS
1. London School of Economics and Political Science, LSE Health and Social Care, London, United Kingdom
2. London School of Economics and Political Science, European Observatory on Health Systems and Policies, London, United Kingdom
3. Kings College, University of London, Centre for the Economics of Mental Health, Institute of Psychiatry, London, United Kingdom

AUTHORS
1. David McDaid, d.mcdaid@lse.ac.uk
2. Helena Medeiros, h.medeiros@lse.ac.uk
3. Martin Knapp, m.knapp@lse.ac.uk

Objective: As part of the two year 32 country EC supported Mental Health Economics European Network (MHEEN), comparative information were obtained first to identify barriers and opportunities to the reform of mental health systems in central and eastern Europe and then to assess the extent to which different economic incentive mechanisms have and/or can be used to help to promote change.

Methods: Collation of information through a series of bespoke questionnaires on economic factors, augmented by a secondary rapid review of published and grey literature. Areas of analysis included approaches to funding; exploration of interfaces between health and other sectors; and the role that played by different economic incentives in system innovation and reshaping the balance of care.

Results: The challenges faced in much of central and Eastern Europe are particularly acute; in contrast to the old Member States, in many countries little progress has been made. Where progress has been made innovative economic incentive structures can be identified.

Conclusions: Rigid financing mechanisms, a lack of flexibility in how resources are allocated to services that best meet the needs of people with mental health problems, an increased reliance on private health insurance, and resistance to the closure of long stay institutions with a consequent loss of jobs are key factors hindering reform. Economic levers such as transitional funding of both new and existing services alongside mechanisms which allow funds to follow service users are among those mechanisms which have helped to promote change in some countries.
Regrettably the second half of the 20th century was burdened by a multiplicity of political conflicts and unrest between as well as within Nations. The psychosocial and economic tolls on individuals affected by these conflicts have been substantial, ranging from acute stress situations to post traumatic stress disorders to chronic adaptive and maladaptive strains.

The broad geographical spectrum of conflicts and the diversity of their nature provide for “naturalistic” observation perspectives for cross-cultural expressions of conflicts as well as adaptational mechanisms, epidemiologic data and vulnerabilities, threshold for breakdown, clinical presentations of communities, families and individuals. The impact of political conflicts is not limited to situations in which they deteriorate to violence. Uncertainty and continuous threats effect people in seemingly “peaceful” prosperous countries.

Issues at focus are illuminated by examination of the Middle East (Fuad Antun), Eastern and Central Europe (Peter Gaszner), the Balkans (Marijana Bras), Latin America (Moti Benyakar) as well as Israel (Arie Shalev), Kenya, South Africa, Sudan, Pakistan, and other focal points as well as Western Europe and the USA. The National data are a basis for common denominators and cultural discriminators.

IMPACT OF POLITICAL TURMOIL IN THE MIDDLE EAST ON MENTAL HEALTH

INSTITUTIONS
1. Private Practice, Beirut, Lebanon

AUTHORS
1. Fuad Antun
2. Thallein Antun

The Middle Eastern area has seen a great deal of ethnic and geographical changes since the start of the twentieth century. This took form in change of borders and creation of countries some on purely demographic basis, not taking consideration of the ethnic component. This has created over the year’s conflicts within the same country but among ethnic groups who were located or relocated without any considerations with their social and religious backgrounds.

The Middle Eastern area composes the main monolithic religions which with time took political identities that were the seeds for conflict.

The western powers played a big role in parceling the geographic area with different countries or political entities purely based on their economic and political interests.

The present decade has seen a wide image of conflicts in many Middle Eastern countries with eruption of violence which is still continuing. We will expand further on the effect of such changes and conflicts on the mental health of areas the Middle Eastern region.
IMPACT OF POLITICAL CHANGES IN THE FORMER CENTRAL EUROPEAN COMMUNIST COUNTRIES ON MENTAL HEALTH

INSTITUTIONS
1. Semmelweis University, Budapest, Hungary

AUTHORS
1. Peter Gaszner

The last 18 years was a time of far reaching changes in Central Europe. The changes caused new problems in Czech Republic, Slovakia, Hungary, Romania, Bulgaria and Slovenia. We had contributions from all these countries. Similar problems came to light in Poland and other Central European countries. The changes generated problems even in neighbouring Austria. After the previous decades of hindered development this two decade became the decades of freedom, but this new freedom caused many new problems, too. These countries have achieved their freedom, but their economy could not keep pace with the political changes. For this reason the countries’ medical services are starved of funding. Naturally this also applies to psychiatry and the education of psychiatrists. In this respect there is much hope for the medium and far future, but the outlook for the immediate future is rather uncertain.

There are also new legal problems. The principal task is to extend the basic human rights, which are a consequence of the political changes. There is a need for new legislation to define and protect the special rights of psychiatric patients. This may be a lengthy undertaking, nevertheless it must be tackled as soon as circumstances permit.

The most difficult area is the mental health. In the formal socialist countries has not enough money, no new methods and try to learn the freedom.

SYMPOSIUM OF THE SECTION ON MASS MEDIA AND MENTAL HEALTH of WPA

In this culture of late modernism we may think that not only the modernism “is dying”. Also many young people make a suicide attempt as the latest unsuccessful opportunity to decide about their lives. What ever be, the successful suicide represent a new copy of TV movies, a sad repetition of feelings of depersonalization. We say again that the suicide is a new failure of human creativity. The match point...

Through the electronic media, the power seeks to restrict the physical contact of bodies, reducing trips, avoiding gatherings, causing people to stay permanently at home-i.e: the control space for the bodies wherein subjects are "locked up" of their own free will so that collective meeting situations are prevented.

TRIÁS, E., Metodología del pensamiento mágico, Barcelona, Gaya Ciencia, 1970
Recent progress into basic sleep physiology and pathology, as well as in clinical research on several psychiatric disorders gave a considerable new momentum to sleep medicine during the last decade. In this context, fundamental issues such as brain plasticity and memory consolidation during sleep have been tackled, and the underlying molecular mechanisms of sleep regulation have been further clarified. These promising insights potentially will provide novel treatment approaches to sleep disorders, which range from the widespread problem of insomnia to the less frequent of hypersomnias and certain parasomnias. These developments concern not only psychiatrists but they may be of interest to any scientist or physician who endeavors to understand an essential aspect of human life.

Evidence on the molecular, cellular and system level suggests that a main function of sleep is the activity-dependent reorganization of neural networks, including the formation of new memories. Thus, sleep after learning has been demonstrated to enhance procedural memories for skills and declarative memories for fact-based information, the storage of which involves the hippocampus. Animal and human research supports the concept that newly acquired memories are replayed and further processed during sleep and that this process contributes to brain plasticity ultimately underlying long-term memory formation.

Based on studies on healthy sleep, the current presentation focuses on emerging insights into processes of disrupted brain plasticity and memory consolidation under conditions of disturbed sleep, including sleep and psychiatric disorders. This line of research might ultimately lead to the development of novel therapeutic strategies to improve sleep and brain plasticity processes - two integral parts of health and functioning.
NEUROPSYCHIATRIC PERSPECTIVES IN THE DIAGNOSIS AND MANAGEMENT OF SLEEP DISORDERS

INSTITUTIONS
1. Athens University Medical School, Psychiatry, Athens, Greece

AUTHORS
1. Thomas Paparrigopoulos

Some neurological patients present with somnolence whereas others exhibit sleeplessness and some others a disruption of the normal circadian alternation of sleep and wakefulness. On the other hand, certain primary sleep disorders such as fatal familial insomnia, narcolepsy, and REM sleep behavior disorder are often associated with neuropathological or neurophysiological alterations and are accompanied by neuropsychological manifestations. Also, neurodevelopmental aberrations are strongly suggested in many cases of sleepwalking and night terrors. Finally, serious cognitive and psychosocial consequences of curtailed or otherwise disturbed sleep are often observed in sleep deprivation, chronic insomnia, obstructive sleep apnea syndromes and narcolepsy. Consequently, to optimize the management of patients with various sleep disorders, it is important to specify the exact nature and the degree of any coexisting neuropsychiatric manifestations.

PSYCHIATRIC ASPECTS OF INSOMNIA: DIAGNOSTIC AND TREATMENT IMPLICATIONS

INSTITUTIONS
1. Athens University Medical School, Psychiatry, Athens, Greece

AUTHORS
1. Dimitris Dikeos

Primary insomnia is the condition of reduced or unsatisfactory sleep, in the absence of any other apparent reasons for the sleep impairment. Insomnia symptoms, however, are quite usually present in various psychiatric conditions and should be taken into account by the treating clinicians. On the other hand, patients who present with the ‘sole’ complaint of insomnia often have underlying psychiatric disorders and/or dysfunctional personality characteristics, which are often concealed by focusing on the problem of sleep difficulties. A comprehensive diagnosis of insomnia should, therefore, include the evaluation of all other associated psychiatric diagnoses and any relevant psychological characteristics. The management of insomnia and in general of any sleep difficulty ideally addresses all those areas and should not be limited to the prescription of sleep-promoting agents. The latter are valuable compounds for the treatment of sleep problems, but they must always be used as part of a wider therapeutic strategy addressing the needs of the individual patient, based on a thorough understanding of his/her psychopathology and on a well-established doctor-patient relationship.
THE FUTURE TREATMENT OF SLEEP DISORDERS IN PSYCHIATRIC PATIENTS

INSTITUTIONS
1. University of Regensburg, Psychiatry, Regensburg, Germany

AUTHORS
1. Göran Häkåk

Insomnia, the most commonly reported sleep problem, affects about one third of the adult population. Recent research into the pathophysiology of insomnia has brought a shift in the approach to treatment. Insomnia rarely occurs in isolation and is typically comorbid with other conditions. Beside treating the primary disorder, now there is a push to acknowledge the existence of chronic insomnia as a psychiatric disorder that itself merits treatment. This recognition is due to the identification of pathophysiological changes and associated morbidity, which can be substantial.

Several lines of evidence that indicate a majority of psychiatric disorders being accompanied by circadian malfunctions and related insomnia have stimulated the development of treatments addressing both, sleep and the related psychiatric disease. In particular, considerable research supports a strong association between physiological mechanisms of antidepressants and antipsychotics and their ability to improve sleep and biological rhythms.

An increased diversity of future available hypnotics with different potency, pharmacodynamic and pharmacokinetic profiles and improved side effect profiles will provide more flexibility in designing individual treatment strategies. Mechanisms of action of these agents include GABA modulators and GABAA partial agonists, GABA2 delta ligands, extra synaptic GABA4 agonist, dopamine D2 receptor antagonists, GAT-1 transport inhibitors, H1 antagonists, herbal agents, and others.

Promising data of long-term proven benzodiazepine-receptor agonists, 5-HT2A and 5-HT2C antagonists, melatonin agonists and orexin antagonists suggest these drugs to be the future most exciting agents exhibiting new mechanisms to improve sleep in psychiatric patients.

FAMILIAL AND CLINICAL ASPECTS OF ALEXITHYMIA

INSTITUTIONS
1. University of Greifswald, Germany
2. University of Tampere, Finland

AUTHORS
1. Hans J Grabe
2. Matti Joukamaa

Interest in the alexithymia construct has expanded considerably since the introduction of the concept thirty years ago resulting in more than 8000 publications (Medline) on alexithymia in the fields of psychosomatic medicine, psychiatry, internal medicine and epidemiology. This symposium aims to present models about developmental pathways that might lead to deficits in affect differentiation and communication and thereby resulting in alexithymic personality traits and about psychophysiological and neurobiological pathways, linking alexithymia as a risk factor to mental and physical disorders. Data will be presented about transgenerational effects and genetics of alexithymia, of its association with psychoathological states, depression and psychosis. Further, recent findings on the functional neuroanatomy of alexithymia will be presented and discussed.

8. Matti Joukamaa

Objective: Numerous studies have suggested an association between alexithymia and depression, which has typically been measured with self-report scales. Our aim was to study how the outcomes of a structured diagnostic interview for depression are related to the results of a self-report scale in alexithymic and non-alexithymic groups.

Methods: Our sample comprised 4805 subjects from general population, aged 30-97 years. They completed the 20-item Toronto Alexithymia Scale and the 21-item Beck Depression Inventory (BDI). Major depression and dysthymia were diagnosed with the Munich version of the Composite International Diagnostic Interview (M-CIDI). The distributions of BDI scores were compared between alexithymic and non-alexithymic subjects in groups with and without a combined diagnosis of major depression and dysthymia. The areas under the curve and ideal cut-off points for BDI were assessed by Receiver Operating Characteristic analyses with M-CIDI diagnosis for depression as a gold standard.

Results: Both in the groups with and without an M-CIDI depression diagnosis the BDI scores of the alexithymic participants were significantly higher than those of the non-alexithymic participants. The ideal cut-off points for BDI were essentially higher in the alexithymic group (18/19) compared with the whole sample (9/10) and with the non-alexithymic group (8/9) while the performance of the BDI was also better in the alexithymic group (p=.019).

Conclusions: A substantial proportion of alexithymic subjects without a depression diagnosis could be rated as depressive if the only criterion is the score of a self-report scale. Furthermore, alexithymic individuals may require higher cut-off points in a self-report depression scale than other people.
FAMILIAL TRANSMISSION AND GENETICS OF ALEXITHYMIA

INSTITUTIONS
1. University of Greifswald, Germany

AUTHORS
1. Hans J Grabe
2. Jessie Mahler
3. Carsten Spitzer
4. Henry Völzke
5. Harald J Freyberger

Background: Alexithymia represents a risk factor for psychiatric and psychosomatic disorders and is associated with less favourable outcome in various treatments modalities. With a prevalence rate up to 30% in subjects seeking psychiatric or psychotherapeutic treatment, there is an urgent need for a better understanding of the psychobiology of alexithymia. Previous studies have described an association between alexithymic traits of mothers and their offspring but did not investigate the fathers’ contribution. Therefore, psychological mechanisms like the mother-child bonding may exclusively explain the observed association. The aim of the present study was to extent this research strategy to fathers, too.

Methods: The familial transmission of alexithymia was assessed in 86 child-parents trios. Hierarchical regression analyses were adjusted for age, gender and education. Alexithymia was assessed with the Toronto-Alexithymia Scale (TAS-20).

Results: Hierarchical regression analyses revealed that the mothers’ TAS-20 scores (standardized beta: 0.3; p= 0.003) and the fathers’ TAS-20 scores (standardized beta: 0.27; p= 0.007) independently contributed to their children’s TAS-20 total scores. The difficulties identifying feelings (DIF) factor scores of both parents explained 28% (p<0.001) of the variance of the DIF scores of their children.

Conclusion: Our results strongly support the hypothesis of a familial transmission of alexithymia. As both parents contributed to the TAS-20 score of their offspring, psychological and genetic factors may be responsible for the observed association. Thus, in addition to the research of psychological factors influencing affect development and differentiation the search for genetic mechanisms contributing to alexithymia should be started.

IS ALEXITHMIA A PRODROMAL FEATURE OF PSYCHOSES?

INSTITUTIONS
1. University of Tampere, School of Public Health, Tampere, Finland

5. Irma Moilanen
6. Hanna Ebeling
7. Juha Veijola

Objectives: The recognition of prodromal symptoms of schizophrenia and other psychoses has eagerly been studied. As far as we know no earlier studies have dealt with alexithymia in this context. We wanted to explore if alexithymia could be a feature which should be taken into account when assessing the occurrence of prodromal symptoms among adolescents.

Methods: This study forms part of the Northern Finland Birth Cohort 1986 Study. The original material consisted of all live-born children (N=9432) in the provinces of Lapland and Oulu in Finland with an expected delivery date between 1.7.1985-30.6.1986. In 2001, when the subjects were 15-16 years old, a comprehensive follow-up survey was conducted. The 20-item version of the Toronto Alexithymia Scale (TAS-20) was the measure of alexithymia. As a screen for prodromal symptoms of psychoses was used the Prod. It is a questionnaire with 21 items. Altogether 5,750 subjects filled in both instruments correctly.

Results: Of the boys 7% and of the girls 10% were alexithymic with no gender difference. The corresponding figures for Prod-screen positives were significantly higher, 15% and 16% respectively. With only one exception all the single Prod items were significantly associated with alexithymia.

Conclusion: Assessment of alexithymic features is an important complement when trying to find prodromal symptoms among adolescents. It is especially recommended because the method, TAS-20, is short and easy to fill in and has been shown to work properly in more than 20 languages.
ALEXITHYMIA: A REVIEW OF THE NEOCognitive AND BRAIN IMAGING EMPIRICAL STUDIES

INSTITUTIONS
1. University of Toronto, Department of Psychiatry, Toronto, Canada

AUTHORS
1. R. Michael Bagby1, Dr., PhD, michael_bagby@camh.net
2. Graeme J Taylor1, Dr, MD, graeme.taylor@utoronto.ca

Aim/Objective: Alexithymia is defined as deficit in the cognitive processing of emotions and is thought to be one of several potential explanatory mechanisms for the onset of several „so called“ psychosomatic diseases and psychiatric disorders. As alexithymia represents a deficit in cognitive processing and regulation of emotions, two ideal methodologies for examining this fundamental assumption are experimental cognitive designs and neuroimaging procedures. In this presentation, we examine the extant body of literature using cognitive and neuroimaging methods in the examination of the alexithymia construct.

Methods: Published scientific works on alexithymia using cognitive and imaging techniques were identified using PubMed and PsyChINFO search engines.

Results: A number of studies using different cognitive paradigms, including: lexical decision making tasks, incidental emotional learning, emotional stroop, perception of affect, sequential priming, automatic processing/affective priming were identified. The results across these six paradigms converge on a consistent picture generally supportive of deficit model of alexithymia. Several studies using imaging techniques, including MRI, fMRI and PET procedures were also found in the published literature. Nearly all imaging studies find alterations in ACC function during processing of different emotional information, although there were some inconsistency in lateralization and signal changes across studies depending on the stimuli and type of experimental task used when subjects were being scanned.

Conclusions: Results from these investigations largely support the underlying assumption that alexithymia represents a deficit in the cognitive processing of emotions.

Depression and personality disorders are etiologically heterogeneous group of brain disorders with complex and partially overlapping genetics, probably underlying the co-morbidity between both conditions. Definitions of clinical phenotypes however are not rooted in neurobiology, and animal models of behavioral despair and anxiety have considerable limitations. Simplistic models cannot explain the apparent complexity, so that current research focuses on epistatic and epigenetic factors in the etiology of these disease states. Although this research is still in its infancy, several milestones have already been reached: Variation in gene expression was confirmed to play a predominant role in individual differences in complex traits including personality and behavior; gene x environment as well as gene x gene interactions were established in humans and the nonhuman primate model. Genotype-phenotype correlations were substantiated by functional neuroimaging. Pertinent research thus supports the notion that both genes and environmental factor impact on brain development and, in doing so, set the stage for the susceptibility to depression. Investigation of subtle alterations in the expression of genes of the serotonergic pathway, such as the serotonin transporter (5HTT), of correlations between 5HTT genotype and brain activity, and of environmental variables interacting with 5HTT variants currently strengthen research on the genetics of depression. Given the etiological and psychobiological complexity of depression, it is not surprising that the identification of vulnerability genes and elucidation of their interaction with environmental stressors is extremely difficult and continues to be among the last challenges of genomics, behavioral neurosciences, and psychiatry.

EARLY LIFE ADVERSE EVENTS: INFLAMMATION AND MEDIATORS

Patients with major depression who are otherwise medically healthy have been observed to have activated inflammatory pathways, manifested by increased proinflammatory cytokines, increased acute-phase proteins and increased expression of chemokines and adhesion molecules. Increased concentrations of interleukin (IL)-6 and/or C-reactive protein in serum and/or plasma have been most frequently observed, although elevations in IL-1-â and tumor necrosis factor (TNF)-â have also been described, both in the peripheral blood circulation and in the central nervous system.

Consistent with the notion that stress may provide a link between depression and inflammation, a number of reports indicate that psychological stress activates proinflammatory cytokines and their signaling pathways. In laboratory animals, psychological stressors increase the proinflammatory cytokines, including IL-1â and TNF-â, in brain regions involved in emotional regulation. Therefore, prenatal programming may significantly influence the inflammation response in the adults, and thereby also susceptibility to development of disease.

The association between depression and inflammation is apparent across the adult lifespan and is evident even in the presence of mild symptoms. These findings suggest that targeting proinflammatory cytokines and their signaling pathways might represent a novel strategy to treat depression, and may be significantly linked to the stress.

This presentation focuses on recent discoveries on early life adverse events and the inflammatory pathway in treatment and prophylaxis.
EARLY LIFE STRESS EFFECTS ON NEUROGENESIS AND ADULT EMOTIONALITY: INTERACTIONS WITH THE GENETICS FOR HIGH OR LOW ANXIETY

Early life environmental factors including prenatal and postnatal stressful events are established from both animal and human research to affect adult emotional and neuroendocrine stress parameters. Repeated exposure to stress in utero (prenatal stress) or to periodic maternal deprivation in the immediate post partum period has been shown to chronically increase anxiety- and depression-related behaviours and hormonal responses of the hypothalamo-pituitary-adrenal (HPA) axis, and to impair cognitive functions and hippocampal neurogenesis, among others. Interactions of early life stress and the genetic predisposition are likely, but less well understood.

Here, I will provide evidence for genetic factors determining the consequences of early life experiences comparing Wistar rats selectively bred for high (HAB) and low (LAB) anxiety-related behaviour, respectively. Exposure of HAB and LAB rats to prenatal stress between pregnancy days 4 and 16 or to postnatal stress between postnatal days 2 and 14 resulted in differential, partially opposite, effects on adult anxiety with HAB offspring becoming less and LAB offspring becoming more anxious compared to unstressed controls. As a result, early life stress attenuated not only the extreme behavioural traits in both lines, but also the line-dependent differences in adult HPA axis reactivity. The neuronal basis for the differential effects of prenatal stress on adult stress responsiveness are likely to be line-dependent alterations of neuropeptide expression patterns, i.e. of vasopressin and corticotropin releasing factor within the hypothalamic-paraventricular nucleus. Moreover, prenatal stress further reduced the relatively low level of hippocampal neurogenesis found in HAB juvenile rats, which is likely due to a failure to increase placental 11β-hydroxysteroid dehydrogenase type 2 activity after stress rather than to different maternal corticosterone or behavioural responses. In contrast, neurogenesis activity was not affected in LAB juvenile by prenatal stress.

In summary, the genetic predisposition of the animal to either high or low anxiety level determines the vulnerability to early life stress. The evolutionary advantage of these opposing effects of early experiences may be to sustain the genetic variability among individuals of a species while allowing flexible and adequate responses to stressful and potentially dangerous stimuli in adulthood.

Impaired glucocorticoid receptor (GR) signaling is a postulated mechanism for the pathogenesis of major depression. Since in vivo expression and functional studies of GR are not feasible in humans, we have generated mouse strains that over- or under express GR: i) GR heterozygous mice (GR+/-) with a 50% GR gene dose reduction; and ii) GR transgenic mice (YGR) with a 100% gene dose elevation. GR+/- mice exhibit normal baseline behaviors, but demonstrate after stress exposure increased helplessness, a behavioral correlate of depression in mice. Similar to depressed patients, GR+/- mice have a disinhibited HPA system and a pathological DEX/CRH test. Thus, they represent a murine depression model with good face and construct validity. YGR mice, in contrast, show reduced helplessness after stress exposure, and an improved HPA system feedback regulation. Therefore they are a model for a stress-resistant strain. These models can be used to study plasticity changes underlying the pathogenesis of depressive disorders. As first potential molecular correlate we identified a downregulation of BDNF in the hippocampus of GR+/- mice. Translational approaches, i.e. how to use these models specifically for clinically relevant questions, will be discussed.

The influence of adverse early-life events on genetic vulnerability in the development of mood disorders was recently highlighted (1). Moreover, stress can profoundly alter synaptic plasticity. We employed an innovative experimental design, reproducing the combination of environmental adverse events and genetic susceptibility. We used the Flinders Sensitive Line (FSL) rats, a well-validated genetic model of depression, displaying distinct features of pathology. To reproduce early-life stress events the FSL rats and their controls, the Flinders Resistant Line (FRL) rats, were subjected to a standard maternal separation protocol. Moreover, FSL and FRL rats, with or without early-life stress, were treated with escitalopram. Aspects related to pathology and antidepressant efficacy were assessed: behavioural despair (Porsolt swim test), hippocampal synaptic plasticity in vivo and synaptic signaling. In the Porsolt swim test, while escitalopram reduced immobility in basal FSL rats, the efficacy of the antidepressant in maternal separated FSL rats was reduced. Moreover, our data show that early-life stress has a different influence on synaptic plasticity in FSL vs. FRL rats and suggest that maternal separation may induce a lifelong enhancement of NMDA receptor-dependent synaptic plasticity in vulnerable rats. Indeed, early-life stress has a strong impact on the molecular machinery regulating plasticity, particularly evident in the FSL rats, in which the combination of early-life stress with genetic background produces functional and molecular lifelong modifications. Our results may contribute to characterization of the molecular effectors of plasticity that mediate vulnerability to stress and response to antidepressants.

Although pregnancy has typically been considered a time of emotional well-being, recent studies show that pregnancy is a relatively high risk time for psychiatric disorders in women, particularly for those with pre-existing psychiatric illnesses. Epidemiological studies report that psychiatric disorders were present in 15-25% of pregnant women, with affective disorders being the more prevalent. However, it is important to note that the literature on psychiatric disorders during pregnancy is frequently complicated by the use of various methodologies, procedures and study populations, and inconsistencies in the postpartum time frame (up to 6 months after delivery) complicate the interpretation of epidemiological data. Recent papers show lower rates of psychiatric problems and pharmacological treatment in pregnant women. This might reflect underrecognition or undertreatment. Moreover, a considerable percentage of diagnosed patients treated introduced substantial modifications in their treatments regime in the moment they knew their pregnancy. In this presentation, the several factors explaining the low percentage of women reporting depression and using antidepressants will be discussed.

The effects of antidepressants in pregnancy could be classified in several main categories: the teratogenic possible effects; the effects on the normal development of the brain and neuropsychological functions; the effects on birth weight and/or early delivery; the risk of increased bleeding on the mother during delivery; the neuropsychological behavior and adaptation after delivery, including not only neonatal withdrawal syndromes but also pain reactivity and increased parasympathetic cardiac modulation during recovery after an acute noxious event and in a wide range of neurobehavioral outcomes; and medium- to long-term effects in neurocognitive functions in those children. These areas will be reviewed according to the most recent published cohort-controlled studies and prospective surveys regarding antidepressants use in pregnancy.

TREATMENT OF DEPRESSION IN PREGNANT WOMEN REQUIRE “DELICATE BALANCE”

Although there is a tendency to avoid psychiatric medications during pregnancy, the high prevalence of affective disorders in pregnant women means that women and their psychiatrists often face impromptu decisions regarding the initiation or continuation of antidepressant therapy during pregnancy. The management of psychiatric problems and pharmacologic treatment in pregnancy is complex and burdened with many biologic and personal factors. Psychiatrist need to consider the impact of untreated illness on the mother and the fetus, as well as the possibility of increased risk for obstetric complications and congenital malformations associated with pharmacological treatment. Antidepressants should be initiated or maintained when the disorder is severe and the efficacy of the psychopharmacologic approach has been demonstrated, giving attention to non-pharmacological alternatives in order to prevent the relapse of the disease in the mother.

This symposium brings five presentations dealing with some more specific issues in Bipolar Disorder patients. It examines some conceptual issues in defining the diagnoses of Bipolar Disorder and Schizophrenia and their overlap in the light of the newest research approaches, continues with a focus on comorbidities and their role in the outcome of juvenile bipolar patients. Another presentation focuses on the effects of the reproductive cycle on the course of Bipolar Disorder. The possible use of the affective temperaments as a potential endophenotype for bipolar disorders is dealt next. Last but not least some new data in the research of stigmatizing and discrimination against Bipolar Disorder patients is presented. Speakers from 5 different countries and three continents bring different perspectives and form the base for discussion of many specific issues in Bipolar Disorders patients.
DISCRETE AND CONTINUOUS APPROACH IN THE CONCEPTUALIZATION OF PSYCHOSES

The diagnostic distinction of bipolar affective disorder and schizophrenia in current classification systems ICD-10 and DSM IV is based on Kraepelin’s definition of „dementia praecox” and „mania-depressive psychosis”. However, the validity of the diagnostic distinction is challenged by various independent findings. The authors review the similarities and distinctions between both disorders in a range from psychopathology to neuroimaging methods with an emphasis on genetic findings as a major source of evidence of an overlap between bipolar disorder and schizophrenia.

Both bipolar disorder and schizophrenia demonstrate several similar psychopathological and epidemiologic characteristics. Both disorders are strongly influenced by genetic factors: results of linkage studies show a partial overlap of susceptibility loci. Two relatively common chromosomal aberrations are associated with both bipolar disorder and schizophrenia. Association studies of candidate genes in either disorder identified several genes involved in both disorders, such as NRG1, DISC1, and G72/G30. Emerging gene functions possibly involved in both disorders include neurogenesis, myelination, and neurotransmission. Bipolar disorder and schizophrenia also demonstrate some similarities in neurotransmitter dysfunction and share some, but not all, pharmacological mechanisms. Cognitive impairment in schizophrenia is well established during acute episodes as well as during remission and is more obvious compared to bipolar disorder. Moreover, children who developed schizophrenia in adulthood are characterised by cognitive, social, emotional, and behavioral impairments, in contrast to an impairment of a lesser degree found in children who later developed bipolar disorder. Also, patients with schizophrenia have more extensive structural brain abnormalities than those with bipolar disorder.

CO-MORBIDITIES AND TREATMENT CHALLENGES IN MANAGING CHILDREN AND ADOLESCENTS WITH BIPOLAR DISORDER

INSTITUTIONS
1. University of Pisa, Psychiatry, Pisa, Italy

AUTHORS
1. Giulio Perugi, Dr., MD, milevr@providencecare.ca

Juvenile BD is reported to be more treatment-resistant than adult BD, and to show poorer outcome. Predictors of treatment non-response in early onset BD are not well defined. Age, gender and age at onset of BD can affect both clinical presentation and pattern of comorbidity, and pharmacological response. Some features, which in adult patients are considered predictors of poor treatment response, (severity, mixed states, psychotic symptoms, and co-morbid substance abuse) are particularly frequent in youths, and they also may influence pharmacological response in children and adolescents as well.

We explored the role of lifetime comorbid externalizing and internalizing disorders as possible predictors of treatment non-response, in bipolar children and adolescents with manic or mixed episodes in a 3 year study. Non-responders had more frequently co-morbid conduct disorder and/or ADHD. Furthermore, they were globally more severe at baseline and required more frequent addition of antipsychotic medications than treatment-responder patients. Co-morbid anxiety disorders did not predict treatment resistance. Interestingly, anxiety disorders and CD were inversely related, with the number of anxiety disorders significantly lower in subjects without CD co-morbidity. The use of antipsychotics was associated with treatment non-response, and it was probably related to the severity of the subjects who received these drugs (i.e. higher prevalence of impulsivity, psychomotor agitation, behavioral problems, psychotic symptoms). Different mechanisms can be involved in treatment-resistance of bipolar subjects with co-morbid externalizing disorders. BD plus externalizing disorders may represent a specific subtype, with earlier-onset and resistance to traditional anti-manic and mood stabilizing drugs.
THE EFFECT OF FEMALE REPRODUCTIVE CYCLE ON THE COURSE OF BIPOLAR DISORDER

INSTITUTIONS
1. Ege University School of Medicine, Psychiatry, Izmir, Turkey

AUTHORS
1. Fisun Akdeniz, Dr., MD, milevr@providencecare.ca

The purpose of this talk is to review the literature and our studies concerning impact of female reproductive cycle on the course of bipolar disorder. The literature concerning following topics is reviewed: the relation between menstrual cycle and mood fluctuations (the impact of puberty on the onset of the illness, the relation between specific menstrual cycle phase and specific mood episode, prevalence of premenstrual syndrome among women with bipolar disorder); the impact of pregnancy and postpartum period on the course of bipolar disorder; and whether menopause is a risk factor for bipolar women or not. The data suggest that hormonal fluctuations are associated with increased risk of mood fluctuations and mood episodes in women with bipolar disorder.

THE SOFTEST END OF THE SPECTRUM: AFFECTIVE TEMPERAMENTS AS A POTENTIAL ENDOPHENOTYPE FOR BIPOLAR DISORDER

INSTITUTIONS
1. University of Palermo, Neuroscience, Buenos Aires, Argentina

AUTHORS
1. Gustavo H Vazquez, Dr., MD, milevr@providencecare.ca

Different family and genetic studies of bipolar disorder suggest that both the phenotype and the genotype of the illness extends from extremely psychotic mania (schizoaffective bipolar disorder) that usually requires hospitalization to prevalent temperamental dysregulation that remains largely ambulatory and untreated in the general population. At the heart of the debate on the boundaries of the bipolar spectrum is whether the soft expressions of bipolar disorder can be reliably identified in epidemiologic and clinical populations, and once identified, which are the potential clinical implications that they should have. We have recently examined the prevalence of affective temperaments between clinically unaffected relatives of bipolar patients and investigated the impact of these "subaffective" forms on their quality of life (QoL).

We administered the scales TEMPS-A Buenos Aires and Quality of Life Index-Spanish version, to a sample of 229 non-ill first degree relatives of bipolar disorder patients ("cases") and controls without family history of affective illness. Our results confirms that healthy relatives of bipolar probands exhibit a higher degree of temperamental dysregulation, and also a clear impact of QoL domains, than normal controls and demonstrates that affective temperaments can serve as an endophenotype for bipolar disorder as judged by the fact that "clinically well" relatives show these traits at a statistically significantly higher than appropriately chosen controls, impacting directly on their quality of life.
STIGMATIZING EXPERIENCES IN PATIENTS WITH BIPOLAR DISORDER

INSTITUTIONS
1. Queen's University, Psychiatry, Kingston, ON, Canada

AUTHORS
1. Roumen V. Milev
   1, Dr., MD, milevr@providencecare.ca

Background: Bipolar Disorder is amongst the most common and disabling psychiatric conditions, with chronic course and significant burden of disease. Patients with Bipolar Disorders experience a significant amount of stigmatizing and discrimination because of their illness.

Method: We have developed an Inventory of Stigmatizing Experiences. It is a questionnaire, which includes both a frequency and an intensity scale, and measures the prevalence and frequency of stigma experiences, with the underlying assumption being that the total score reflects the pervasiveness of stigma experienced across different life domains.

Results: Eighty-four patients attending a specialized tertiary service for patients with Bipolar Disorders were screened with the Inventory of Stigmatizing Experiences. The results show that the experience of stigmatizing events and discrimination because of mental illness is very high and occurs almost universally. Gender does not seem to have significant impact, but those who are employed experience a lot more perceived stigma. Patients who were hospitalized experienced more stigma as well.

Conclusion: Stigmatizing experiences and discrimination is common in patients with Bipolar Disorders, and requires significant work towards reducing it.

Forensic psychiatry and prison mental health are among the most invisible and under developed parts of mental health care services, in particular in countries that do not belong to the wealthiest in the world. And even in the wealthy ones there is still a lot to be desired. Besides, changing the usual repressive characteristics in forensic psychiatry and prison mental health will contribute to a more preventive criminological policy by the authorities on the longer term. Global Initiative has been active in this area for the past seven years and has developed a wide range of projects in this field in Eastern Europe and the former Soviet Union, and is expending its work also to other parts of the world. The goal of most of the initiatives is to develop a consecutive chain of services for forensic psychiatry and prison mental health, and to promote inter-sectorial collaboration. In Europe, prison mental health has become a priority issue, recognizing the much higher prevalence of mental illness among the prison population. Forensic psychiatry deserves equal attention. This symposium will provide the audience with an update on recent initiatives, obstacles, failures and successes, and will argue for more attention to this field of work.
DEVELOPING MODERN FORENSIC PSYCHIATRIC TREATMENT IN LITHUANIA

INSTITUTIONS
1. Rokiškis psychiatric hospital, Rokiškis, Lithuania
2. Global Initiative - Vilnius, Vilnius, Lithuania

AUTHORS
1. Algimantas Liausedas¹, Dr, MD, a liausedas@rpl.lt
2. Virginija Klimukiene², Ms., vklimukiene@gip-global.org

Modern forensic psychiatric treatment is a set of services widely acknowledged as the most appropriate for effective implementation of: 1) compulsory medical treatment measures, which can be prescribed by the court to persons who are recognized as being of diminished capacity or incapacitated; 2) psychosocial rehabilitation, which enables a mentally disabled person to reach the optimal level of his/her functioning in the community and 3) re-socialization, which is a synonym of crime prevention. The main purpose of this presentation is to describe the modern forensic psychiatric treatment services already implemented in Lithuania, to be more specific, in Rokiškis forensic psychiatric hospital, and outline the principal guidelines for further development. The three fundamental components of the modern forensic psychiatric treatment are the following: 1) differentiation of patients into several levels; 2) multidisciplinary team work; 3) risk assessment instruments, which help to develop individual plans for treatment, prepare adequate reports to the court, organize the follow up of the patient. These components were successfully incorporated into the scheme of in-patient forensic psychiatric treatment.

Currently the out-patient forensic psychiatric care is not very well developed in Lithuania. The inter-ministerial task force has prepared the document which emphasized the need of cooperation at least between the Ministry of Health and Ministry of Social Affairs and described how the ambulatory forensic psychiatric care should be organized. Unfortunately this document has not come into force yet. On the other hand the society is not prepared to accept forensic psychiatric patients.

PRISON MENTAL HEALTH IN A CARIBBEAN SETTING: OBSTACLES, CHALLENGES AND SUCCESSES

INSTITUTIONS
1. Bon Futuro prison, Willemstad, Netherlands Antilles

AUTHORS
1. Michael Izenia¹, Mr.
2. Marscha Mirte¹, Ms.

Fifteen years ago a prison mental health department (FOBA) was established at Bon Futuro prison on the Dutch Antillean island of Curacao. The development was made possible with help from colleagues from The Netherlands. In the course of the years the situation in the prison deteriorated and the FOBA ran into trouble due to lack of staff, lack of materials and possibilities for a day time program, use of the department for prisoners who had no mental health problem but had to be isolated for other reasons, etc. Since 2006 a new initiative has started with help of Global Initiative on psychiatry. Staff is being trained, materials have been purchased and plans are being drawn up to develop a consecutive chain of forensic and prison mental health services on the island. We have along way to go and much still needs to be done, but the enthusiasm is back and there is hope again for the future.
DEVELOPING A CONSECUTIVE CHAIN OF FORENSIC PSYCHIATRIC AND PRISON MENTAL HEALTH SERVICES IN GEORGIA

INSTITUTIONS
1. Global Initiative - Tbilisi, Tbilisi, Georgia
2. National Forensics Bureau, Tbilisi, Georgia

AUTHORS
1. Nino Makhashvili, Dr, MD, nmakhashvili@gip-global.org
2. George Cheishvili, Dr, MD, gcheishvili@gip-global.org

The presentation addresses 3 interlinked fields - pre-trial forensic examination and assessment component, forensic/compulsory treatment services and prison mental health development in contemporary Georgia.

We present the factors that conditioned the underdevelopment of the forensic psychiatry in Georgia:
- deficits in legislation
- fragmented and insufficient services with unclear "patient trajectory"
- narrow assessment and treatment modalities
- educational and motivational aspects
- closed and rigid system
and their influence on the delivered care and everyday interactions with patients.

The paper will provide the analysis of the recent context and explain carefully targeted interventions at micro (technical facilities, services), meso (professionals, education) and macro (law and policy) levels. We will describe an importance of cross-country fertilization (Dutch and Lithuanian experience sharing) and gradually changed understanding and how this is reflected in new buildings for pre-trial psychiatric forensic examination in Tbilisi and compulsory treatment hospital in Kutiri, West Georgia with a new “care concept” behind their architecture and design, a modern training module for multi-professional teams, including guards; and new treatment and care guidelines, etc.

Special attention will be given to penitentiary system and ongoing work there, including ToT (Trainings of Trainers) for prison staff, reforming a psychiatric ward, juvenile justice issues, etc.

We will highlight the forensic psychiatry’s and prison mental health role and place in Georgian mental health sector, current reform’s potentials and risks and present future strategies for advancement of a consecutive chain of above described services.

REFORM OF THE SERVICES FOR MENTAL HEALTH CARE AND FORENSIC PSYCHIATRY IN SERBIA

INSTITUTIONS
1. International Aid Network, Belgrade, Serbia and Montenegro
2. Gornja Toponica psychiatric hospital, Niš, The Netherlands

AUTHORS
1. Branko Vujadinovic, Mr, bvujadinovic@ian.org.yu
2. Milan Stanojkovic, Dr, MD
3. S Stanojkovic, Dr, MD
4. S Vladevic, Dr, MD

As a result of the cooperation between Global Initiative on Psychiatry (GIP) and International Aid Network (IAN) there are two ongoing projects on mental health care which are realizing in Serbia. During joint work mutual interest for reform of services for mental health care in prisons and different organization of centers for forensic psychiatry had occurred.

Initial ideas for changing treatment of persons with mental health problems in prisons and at the departments for forensic psychiatry appeared after joint visits of GIP and IAN teams to Central Prison Hospital in Belgrade and to center for Forensic Psychiatry of Special Psychiatric Hospital Gornja Toponica near Niš.

After analysis of the situation conducted with the management of the Special Psychiatric Hospital, we came to a common conclusion that the main problems are: lack of cooperation between sectors, insufficient number of centers for forensic psychiatry in Serbia, inadequate space and absence of overall pharmaceutical and psychosocial rehabilitation treatment a priori in Central Prison Hospital.

Ideas of reforming of services for forensic psychiatry were considered and it had been concluded that the result of the reforms should be establishing of network of the contemporary centers for forensic psychiatry that should be closely related to regional services for community mental health care with goal to enable therapeutic continuation and successful re-socialization and reintegration in community for some persons who were hospitalized by the court order.
DEVELOPING FORENSIC PSYCHIATRIC AND PRISON MENTAL HEALTH SERVICES IN RUSSIA

INSTITUTIONS
1. Global Initiative on Psychiatry, Hilversum, The Netherlands
2. GIP - Russian representative, St Petersburg, Russian Federation

AUTHORS
1. Robert van Voren¹, Mr, rvvoren@gip-global.org
2. Konstantin Antsiferov², Mr.

Over the past seven years Global Initiative on Psychiatry has been involved in projects to improve prison mental health care services in Russia. Starting in St. Petersburg in 2001, the foundation is now active both in the Kresti pre-trial prison in St Petersburg and in Kaliningrad region. The projects constitute of a physical and attitudinal part: the living conditions for the prisoners are improved up to humane living standards, and a training program is directed at changing the attitudes of the prison personnel to prisoners with mental health problems. Also the medical staff is trained in contemporary prison mental health care delivery.

In practice the improvement of the physical environment for the prisoners with mental health care problems can be accomplished. However, attitudinal changes are much more difficult to obtain, in particular at a time when the political climate is becoming more repressive and old approaches and methods are reintroduced.

In the field of forensic psychiatry work has started in the high security forensic psychiatric hospital in Kaliningrad region. The first results are very positive and give hope that modern approaches to forensic psychiatric treatment can be introduced.

Many of the countries in Central & Eastern Europe and the New Independent States had an almost exclusively institutional mental health care system when the communist system came to an end. In most of the countries many steps have been made in the direction of the de-institutionalization of mental health care services. In some country much effort has been put in developing consecutive chains of mental health care service, trying to provide persons with mental illness with a network of mental health care services that meet their needs in the best possible way. These attempts are very much dependent on political will, financial possibilities, legal changes to make them sustainable, and the presence of a critical mass of reform minded mental health care workers.

The reform process is hampered or obstructed when this political will is not there or withers away, when the necessary financial means are not provided to make the new services sustainable, and in many of the new EU member states by the fact that increasing numbers of mental health professionals emigrate to the old EU member states. At this symposium a number of active reformers from Central and Eastern Europe will tell their story about how they deal with the tension between what is needed and what is possible, what obstacles need to be conquered and what successes can be reported.
DEVELOPING SERVICES FOR EATING DISORDERS IN EASTERN EUROPE

INSTITUTIONS
1. Eating Disorder Center Vilnius, Vilnius, Lithuania

AUTHORS
1. Brigita Baks1, Dr., MD, brigitab@yahoo.com

In recent years eating disorders have become a much debated issue both within the mental health community and among the general public. One can hardly open a popular journal without finding an article on anorexia or one of the other eating disorders, with instructions how to prevent it, or how to detect a developing eating disorder, or where to go for adequate treatment. In particular during the past two years the issue has repeatedly reached the front pages and covers of publications after the fashion industry started to respond to growing protests and eventually issued restrictions on the use of underweight models. Finally, it seems, the issue has acquired the attention it desires, although still many people do not realize that eating disorders are more lethal than schizophrenia, and more people suffer from them.

Unfortunately, in most countries in Eastern Europe and the ex-USSR attention is still scarce and treatment of persons with eating disorders does not differ very much with that of twenty years ago. The disorder is repeatedly diagnosed as a form of schizophrenia, and treatment with neuroleptics or forced feeding is no exception. Most of the patients are young girls, adolescents and sometimes even younger. The illness seriously endangers their development as women, threatening their ability to bear children at a later age. Many patients who still can be treated and cured, become chronic patients, and will as a result remain a permanent burden both on the family and on the health care system.

DEVELOPMENT OF COMMUNITY MENTAL HEALTH SERVICES IN THE COUNTRY RECOVERING FROM THE WAR

INSTITUTIONS
1. Gornja Toponica, Nis, Serbia and Montenegro

AUTHORS
1. Milan Stanojkovic1, Dr., MD
2. S Vladevic1, Dr, MD
3. S Stanojkovic1, Dr, MD
4. Z Stanojkovic1, Dr, MD

During the last decade of the 20th century Republic Serbia was exposed to civil war that ended in disintegration of former SFRJ and with NATO bombardment. International economic sanctions lasted more than three years. Approximately 500,000 refugees in Serbia is one of the consequences of the civil war. Those events had negative impact on mental health of the nation, and led to deterioration of services for mental health care.

Since 2000 Republic Serbia is in transition process, and since 2003 process of reorganization started, mainly reorganization of institutionalized, psychiatric services in terms of development of community services for mental health care.

Process of service transformation run by National Committee for Mental Health started with analysis of demographic data, economic situation and condition of services and human resources.

Reform which had started in Niš led to significant changes in Special Psychiatric Hospital where number of beds for asylum patients had been reduced in half and specific model of implementation of community mental health care principle within hospital significantly changed atmosphere in institution. First community mental health care center was established in Mediana, the biggest municipality in Niš.

Project for development of collaboration between mental health services and social care services started a year ago, and partner participants are NGOs GIP and IAN, Ministry of Health, Ministry of Labor and Social Welfare and Special psychiatric Hospital. Establishing of the new community mental health care centers and first protected homes in four municipalities in Serbia should be the result of this project.
CRISIS INTERVENTION IN EASTERN EUROPE: A NEW APPROACH

INSTITUTIONS
1. Vasaros psychiatric Hospital, Crisis Intervention Center, Vilnius, Lithuania

AUTHORS
1. Tamara Kuntilja, Dr, M.D., tkuntilija@centras.lt

The aim of this presentation is to describe how western models of community mental health services and namely crisis intervention are being implemented in two Eastern European countries - Lithuania and Georgia - with different socioeconomic, legal and cultural backgrounds. Mental health system in these countries undergoes period of significant changes. Projects enhancing emergency psychiatric service delivery, based on community mental health, are being developed. During this process the Dutch model of crisis intervention service was introduced and partially implemented firstly in Lithuanian mental health system. Obstacles and mistakes were analysed and gave possibility to use this Lithuanian experience in arranging the new concept of crisis intervention service in Georgia in transitional period. This presentation will analyse different aspects of crisis intervention service delivery within these two countries in transition.

DEVELOPING A FINANCIAL BASIS FOR COMMUNITY PSYCHIATRY WITHIN THE FRAMEWORK OF THE 100 HOSPITAL PLAN

INSTITUTIONS
1. Ministry of Health and Social Affairs, Tbilisi, Georgia

AUTHORS
1. Sandro Uroshadze, Mr., sandrou@moh.gov.ge

The structure of Georgian National Health Accounts shows a big portion of out-of-pocket payments from the population. Provisional figures of 2006 give overall expenditure of up to 10% of Gdp where private expenditure is up to 80%. These are mostly household out-of-pocket payments for private insurance. According to several surveys the society recognizes the health risk management issues being second by their importance after employment. In 2007 the GoG started a major Health System Reform (HSR) to improve the access of the population to the quality health care services (QHCS). There are two main objectives within this strategy:

a. New privately owned hospital and PHC infrastructure will be created. The expected result is that by the end of 2009 almost all the hospitals and PHC facilities in Georgia will be privately owned and newly constructed/rehabilitated.
b. Healthcare financing model, based on Private Health Insurance will be developed. The vision is that the government will purchase health insurance on the private market for people in need and improve access to affordable insurance products for all the others. In 2007, Government of Georgia started making structural changes to the system. The main idea is that the Government funds will be directed primarily to the vulnerable population. Moreover, Government will switch the traditional state-agency-administered health programs to the private insurance market. During the four forthcoming years the existing “health care programs” of “health service purchasing” will be replaced with “insurance purchasing”. On June 29, 2007, the Parliament of Georgia approved changes in the Georgian law on “healthcare”.
ESTABLISHING A COMMUNITY PSYCHIATRY MODEL IN A BULGARIAN SETTING

INSTITUTIONS
1. Global Initiative - Sofia, Sofia, Bulgaria

AUTHORS
1. Valentina Hristakeva1, Ms, v.hristakeva@gip-global.org

The presentation will discuss some difficulties in implementing a community psychiatry practice in a Bulgarian setting. On the background experience of GIP-Sofia of two similar projects using same resources but implemented with different management mechanism, the importance of local “ownership” and clear mechanism of collection of feedback and evidence of the effectiveness of the change process will be discussed. Some obstacles encountered in attempting to set up community psychiatry programmes as well as practical examples of how did we tackle this problems will be described.

Development aid has become an integral part of the budgets of most developed nations. The European Union has set a financial norm for the member states, and also new EU members are developing their own development aid program. Most of the older EU member states as well as USA and other major international donors have a development aid policy with a history of almost half a century. They are facing the challenge to decide on priorities, both with regard to thematic issues and target countries. The Millennium Development Goals (MDGs) serve as milestones for donor countries in setting priority with regard to international development; however mental health as such is not mentioned in the MDGs. As a result in virtually none of the development aid programs mental health has been included on its own accord. In most cases it is neglected, and when a mental health component is included it is related to trauma care. As a result, trauma care programs are often set up without linking it sufficiently to the development of a structural, sustainable mental health care system, and as a result when foreign aid organizations move away much of what has been built up crumbles and eventually disappears.

In many of the countries in the under developed world mental health care is either virtually non-existent or in bad shape. This can be changed, and needs to change, so that mental health programs would become integral part of developmental policies worldwide. This symposium highlights the predicament we face.
MENTAL HEALTH, DEVELOPMENT AND DEVELOPMENT AGENCIES

INSTITUTIONS
1. World Health Organization, Mental Health & Substance Abuse, Geneva, Switzerland

AUTHORS
1. Benedetto Saraceno, Dr., MD, saraceno@who.int

Development is an organized effort to help a society improve its social, economic, political and health conditions in a manner that is sustainable. This presentation will try to demonstrate the importance and relevance of the field of mental health to development, and to describe the most important linkages between mental health and key development areas highlighted by development agencies. These include (i) Democracy, good governance & human rights; (ii) Economic Growth and development; (iii) Health and development and (iv) Disasters, conflict and development. It then demonstrates and describes how the field of mental health can strengthen development interventions and outcomes in each of these areas.

A special emphasis will be given to the mental health consequences of disasters which have long been recognized by development agencies, but the actual development programs put in place have not been adequate. The immediate response is often to set-up widespread vertical, trauma focused programmes. These programs are costly and do not address the wider development issue of establishing a mental health system capable of addressing a) short term mental health needs of a disaster, 2) longer term mental health needs following disasters and 3) the needs of vulnerable groups affected by disasters.

FIELD EXPERIENCES OF INCOME GENERATION AND USER MOVEMENTS IN DEVELOPING COUNTRIES: A PRACTICE BASED TALK ON MENTAL HEALTH AND DEVELOPMENT

INSTITUTIONS
1. BasicNeeds, Leamington Spa, United Kingdom

AUTHORS
1. Chris Underhill, Mr, chris.underhill@basicneeds.org.uk

Development has many meanings. The most common use of the word in association with mental health is developmental psychology, the study of childhood disorders. Those with a more global focus associate the word with the developing world, but tend to think of it in terms of providing standard psychiatric care in a developing world context. Within the arena of global aid, however, development refers more generally to poverty reduction and other social indicators of change (education, gender equality). Though seemingly more distant from questions of mental health, poverty reduction can, in fact, be a major determinant of mental health outcomes. This talk will draw on examples of field work by BasicNeeds, an NGO with eight years of experience coordinating economic and social as well as clinical interventions for over 45,000 people with mental disorders in the developing world. The talk will cover the following:

- How to put a programme in the field
- Non-medical approaches to health
- Working with mental health service users on the ground
- 4 Policy implications of a developmental approach to mental health
MENTAL HEALTH NURSING AS A KEY TO MENTAL HEALTH CARE DEVELOPMENT IN UNDERDEVELOPED COUNTRIES

INSTITUTIONS
1. Professional University of Arnhem/Nijmegen, Nijmegen, The Netherlands

AUTHORS
1. Rob Keukens1, Mr., rkeukens@gip-global.org

Many mental health needs in underdeveloped countries are unmet, mainly due to insufficient numbers of mental health professionals. For example, the median number of psychiatrist in Africa is 0.04 per 100,000 population, the median number of mental health nurses is 0.2 per 100,000 population. In comparison, the median number of nurses in mental health settings is in Europe 26.76 per 100,000 population.

In many countries, nurses are the largest group of professionals working in health care. In principle, through adequate education and support, nurses can provide mental health care to individuals and communities. The management and treatment of mental disorders in primary care and general hospitals is a fundamental step which enables the largest number of people to get easier access to services. For this to happen, however, general health personnel, in this case general nurses, need to be trained in the essential skills of mental health care.

But, while training facilities for some other professionals have been developed, the country has neglected creating training facilities for (mental health) nurses. In many countries there is no specific mental health training for nurses. Therefore, mental health issues should be incorporated into nursing education with mental health concepts introduced early, reinforced and expanded throughout the curricula and developed through experiential learning opportunities. The recognition that mental health is an essential component of primary health care and general hospitals is articulated in developing basic mental health nursing modules and implement these modules into the already existing curricula for general nurses.

PUTTING MENTAL HEALTH ON THE DEVELOPMENT AID AGENDA

INSTITUTIONS
1. Global Initiative on Psychiatry, Hilversum, The Netherlands

AUTHORS
1. Aleksandras Avramenko1, Mr., aavramenko@gip-global.org

This presentation will focus on how mental health needs are being met in the least developed countries and possibilities how these needs can be presented to the public in general and donor communities in the West. The linkages between the Millennium Development Goals and mental health will be discussed, emphasising disproportional attention form the official Developmental Aid agencies to the several developmental issues.

Developmental Education (DE - raising awareness in the Western countries about developmental issues), is currently seen as a tool to advocate for solidarity and support to poorest and most suffering people. DE also plays big role in setting priorities by the international donors. Mental health issues so far has been poorly advocated for as a part of the developmental aid and were virtually ignored by the donors. The ways how big international health and mental health organizations (WHO, MHE, EUPHA, WPA etc) and national health N(GO) could lobby for bigger attention towards mental health issues as a part of development aid will be discussed.

GIP initiatives on promoting Mental Health as a developmental issue will be briefly presented.

Mental health care is a mirror of society. The more humane and civil a society, the more chance there is for a humane, user-oriented mental health care system in which human rights are respected.

However, a civil society does not automatically produce a humane and consumer-oriented mental health care system. In spite of the fact that a large portion of society is affected by mental health problems, consumers typically remain stigmatized, invisible, and often neglected, and as a result mental health services are often underfinanced and under-rated. People with mental illness are often segregated - psychologically and, in many cases, also physically and legally - from the rest of society.

Violations of the rights of persons with mental illness, as well as outright abuse of psychiatry for non-medical purposes, take place in many countries. The abuses cover a wide range of issues and vary from political abuse of psychiatry in various countries such as China, to maltreatment of prisoners in US prison mental health facilities, from the absolute lack of quality of life and human rights violations in social care homes in Eastern Europe and the Middle East, to carefully orchestrated infringements on the mental health of prisoners in Guantanamo Bay.

This symposium does not mean to provide all the answers, or wishes to cover all the instances when abuses take place. It is meant to stimulate a discussion that is a vital element in upholding ethical standards of the psychiatric profession.

MONITORING HUMAN RIGHTS VIOLATIONS IN CLOSED INSTITUTIONS - OBSTACLES, CHALLENGES AND RESULTS

INSTITUTIONS
1. Vilnius University, Vilnius, Lithuania

AUTHORS
1. Dainius Puras⁴, Dr., MD, Dainius.Puras@mf.vu.lt

Effectiveness of mental health reforms depends to a large extent on what is the level of commitment for changes among major stakeholders - general public, users of services and their relatives, psychiatrists and other professionals, politicians.

Countries of Central and Eastern Europe are still in dramatic and challenging traditions in many different fields of public life, including the field of mental health policy and services. One of the ways to better identify obstacles and opportunities for change is to facilitate open public discourse about past, present and future of the field of mental health in each country specifically, and in the whole region in general. The best way for such kind of debate appears to be debate around human rights situation and perspective.

Several attempts have been undertaken during recent years in Lithuania and neighbouring countries to monitor human rights in psychiatric institutions. Initiative was usually coming from non-governmental organizations, and after results were reported, other stakeholders were responding with different views. Analysis of the discourse, generated by human rights monitoring reports and responses from different stakeholders will be presented. In this context, perspectives of further development of system of values among psychiatrists, politicians and general public in the new European democracies will be discussed.
MENTAL HEALTH ISSUES WITH REGARDS TO DETAINEES IN GUANTANAMO BAY:

INSTITUTIONS
1. Institute of Psychiatry - Ain Shams University - Cairo, Cairo, Egypt

AUTHORS
1. Ahmed Okasha1, Prof, MD, aokasha@internetegypt.com

The continuing detention without fair trial of prisoners is unacceptable in terms of human rights, but it is also ineffective in terms of counter-terrorism.

Guantanamo Bay exists outside the law: torture and ill-treatment, indefinite detention, a presumption of guilt and the absence of fair trials. Detainees designated „enemy combatants” are not allowed even the basic right to challenge the lawfulness or conditions of their detention. Governments as diverse as the United Kingdom and Saudi Arabia have called for closure. United Nations experts and monitoring bodies have made it clear that the facility undermines fundamental human rights protections. Yet some countries remain silent on the conditions at Guantanamo Bay nor has it taken any significant action to protect the rights of their own detainees. The US administration says it would like to close Guantanamo Bay if there was an alternative. Amnesty International believes the alternative is clear: Human rights for all. No exceptions.

The paper will discuss the mental health violations and suicides happening among detainees and the violation of human rights in what assumingly is one of the most democratic countries.

HUMAN RIGHTS ISSUES IN MENTAL HEALTH IN POST-WAR SERBIA

INSTITUTIONS
1. International Aid Network (IAN), Belgrade, Serbia and Montenegro

AUTHORS
1. Vladimir Jovic1, Dr, MD, vjovic@ian.org.yu

Years of war and economic sanctions in nineties have had lasting effects to health care system in Serbia. Overall context for development of mechanisms for protection of human rights has been impeded, and political tensions in a last several years, only made things worse. Reforms of the mental health care system started in 2003, initiated by the Ministry of Health. After five years we can say that there have been many obstacles, and these will be discussed in this presentation. First of, challenges to human rights of mentally ill are stemming from current organization of services. Secondly, there is a lack of adequate legislation, together with lack of monitoring of procedures in existing legislative framework. Thirdly, there is no concentrated effort (political, financial, and managerial) toward implementation of proclaimed principles of national mental health policy. Fourthly, there is unrecognized role of nongovernmental sector, and lack of creative dialogue between sectors of the society. Still, this situation is also bearing many possibilities for positive development, which will be also discussed.
POLITICAL ABUSE OF PSYCHIATRY - STILL A MEANS OF STATE REPRESSION?

INSTITUTIONS
1. Global Initiative on Psychiatry, Hilversum, The Netherlands

AUTHORS
1. Robert van Voren¹, Mr., rvoren@gip-global.org

Over the past years, political abuse of psychiatry has remained on the agenda of the international psychiatric and human rights community.

Information on continued abuse of psychiatry for political purposes in the People’s Republic of China has reached the West, suggesting that the Chinese government is continuing the systematic state policy of using psychiatry for political purposes. New individual cases of political abuse of psychiatry in Russia have also been widely published. In this case it seems that there is no central governmental policy in this respect, but that the worsened political climate has given local authorities the feeling that using psychiatry as a means of repression is again possible. Also in some of the Central Asian republics cases of political abuse of psychiatry have been reported.

This presentation will discuss the latest evidence on these abuses, and discuss what the international community can do to help bring these abuses to an end.

THE DEFENCE OF PATIENT RIGHTS IN THE CCEE/NIS AS AN INTEGRAL PART OF MENTAL HEALTH SERVICE REFORM

INSTITUTIONS
1. GGZ-Nederland, Amersfoort, The Netherlands
2. Global Initiative - Vilnius, Vilnius, Lithuania

AUTHORS
1. Karile Levickaite⁵, Ms, klevickaite@gip-global.org
2. Clemens Huitink¹, Mr, chuitink@ggznederland.nl

Sovereignty, diversity, indivisibility of the person, preservation of a social network and civil rights, positive image of the ill and illness, medical-technical standards, equal access are user values. In this contribution the argument will be made that these values are equally important for the mental health system reform as such as that it is used as a tool for reform in many western countries. In the CCEE/NIS countries however the process of implementing these values is facing extra difficulties. The contribution will focus on that but will also bring about that patients rights are human rights and thus universal applicable.

The user-movement has gone a long way. Started and worked from a “splendid isolation” to more and more co-operation with professionals. That is never a self-evident case, but always happens under the conditions of the user-movement. This may seem pedantic, isn’t though.

Mental health policies and strategies are rarely adopted by governments in the CCEE/NIS countries. If they are, the implementation is rather formal, lacks of sufficient funding. Human rights and patients’ advocacy issues are not always included into the policies. In a situation in which coercion and oppression still play important role it is important that the people really concerned, are able and enabled to loudly articulate their own conditions.

This contribution will fuel that discussion.
People with HIV are more likely to experience a range of mental health problems. Neuropsychological disorders, such as dementia, occur with late-stage illness and remain among the most challenging manifestations of HIV. Moreover, receiving an HIV diagnosis, bereavement, the breakdown of relationships, resulting financial or employment difficulties can result in feelings of deep unhappiness which are difficult to manage and may interfere with the ability to function in daily life. Depression appears to be more common in people with HIV than in the general population.

People with HIV/AIDS who suffer from mental health consequences of the infection are, in fact, double victims. Almost invariably stigmatized because of the disease, they have to deal with the trauma of carrying a potentially fatal illness and of facing an environment that fears losing them. Focusing attention on the important, but often overlooked, interplay of mental health and HIV/AIDS is one way to strengthen the participation of those affected by HIV/AIDS, help defend their interests and counter stigma. Training mental health personnel and those involved in addressing the impacts HIV/AIDS will also build better support systems and help diminish spread of the disease.

In 2005, Global Initiative on Psychiatry initiated an innovative program on Mental Health & HIV/AIDS in 9 countries in Central Asia, the Caucasus and Southeast Europe. The symposium will present key findings and challenges faced in this work and elaborate on the scope of the problem in Africa and in Russia.

BETTER UNDERSTANDING THE INTERSECTION OF HIV/AIDS AND MENTAL HEALTH IN AFRICA & GLOBALLY

INSTITUTIONS
1. South Africa

AUTHORS
1. Melvyn Freeman¹, Dr., MD, mfreeman@telkomsa.net

The interconnections and intersections between mental health and HIV/AIDS are multi-faceted and multi directional. For example mental health is an important risk factor for contracting HIV and often plays a role in the course and progression of the disease - not least linked to adherence to medication. On the other hand for many people the HIV virus has both physiological impacts on the brain as well as having psychological consequences resulting from being HIV positive.

The vast majority of PLHA, especially in low and middle income countries, receive no care and treatment for their mental health problems. The HIV pandemic also has profound consequences on the mental health of others not directly infected. For example children orphaned or otherwise made vulnerable by HIV have been found to show high rates of mental disorder. In addition family and carers as well as health workers often become highly psychologically stressed by having to deal with PLHA. This presentation will summarise available research evidence of the mental health impacts of HIV/AIDS with a special emphasis on African research. An argument will be made that the cumulative mental health impacts on societies with high prevalence of HIV/AIDS is greater than the sum of the parts.
THE IMPORTANCE OF AN INTEGRATED APPROACH TO HIV/AIDS AND MENTAL HEALTH IN THE NETHERLANDS, EASTERN-EUROPE, THE CAUCASUS AND CENTRAL ASIA

INSTITUTIONS
1. Centre and Treatment team, GGZ Buitenamstel/VUMC, Amsterdam, Amsterdam, The Netherlands

AUTHORS
1. Annemiek Schade1, Dr., MD, a.schade@ggzba.nl

Objectives
The HIV-epidemic is a big problem in almost every part of the world. In many countries, like in Eastern–Europe, the Caucasus and Central Asia, the amount of new HIV-infections is growing rapidly. An important part of the HIV-infected people have mental health problems such as depression, anxiety, addictive disorders, personality disorders and cognitive disorders. For example, HIV-positive women have a four times greater chance of a depressive disorder then HIV-negative women (1)

It is very important that mental health problems among people living with HIV and AIDS are recognised and treated. Depressive symptoms are associated with the worsening of the HIV-infection (2)

Method
Some case studies of patients with HIV/AIDS and mental health problems will be presented. Specific difficulties in making a diagnosis and the pharmacological and psychotherapeutic of these patients will be discussed. There will be special attention for the treatment situation of people living with HIV/AIDS and mental health problems in Eastern–Europe, Caucasus and Central Asia.

Conclusion
Treatment of mental health problems among people living with HIV/AIDS is very important, and it is often a forgotten and neglected part of the treatment of HIV/AIDS.

Ickovics, JR et al. JAMA, 2001, 285, 1466-1474

MENTAL HEALTH PROBLEMS OF PEOPLE LIVING WITH HIV/AIDS (PLHIV) IN SOUTH CAUCASUS

INSTITUTIONS
1. Global Initiative - Tbilisi, Tbilisi, Georgia

AUTHORS
1. Jana Javakhishvili1, Dr, MD, jjavakhishvili

GIP established Expert Centers on Mental Health and HIV/AIDS in Armenia, Azerbaijan, Bulgaria, Georgia, Moldova, Kyrgyzstan, Kazakhstan, Serbia and Tajikistan focusing on improving the quality of life of PLHIV. This presentation will explain the results of research done by these Centers in 2007-2008 in the South Caucasus.

According to the research results, mental health policies and services in the countries are underdeveloped. By comparison, HIV/AIDS legislation and services are more developed. There is also lack of coordination and an underdeveloped referral system between the two fields. VCT services are not equally developed in the three countries, but research shows that all three countries need a more efficient system of mental health education for VCT providers.

Additionally, the research confirms significant mental health problems among PLHIV. The initial stage of adjustment to the diagnosis is characterized by “shock”, accompanied by anxiety, fear of death, guilt, depression and suicidal thoughts. More severe mental health problems can occur on the AIDS stage, where neurological manifestations of the disease can cause cognitive impairment. Interesting differences and similarities are found between the three countries. For example, study results in Georgia show more acute mental health problems among IDU PLHIV, while Armenian IDUs adjust better to the diagnosis due to services that “prepare” them for a positive diagnosis. Also revealed was that PLHIV feel they experience greatest degree of stigma and discrimination from health care providers. Factors contributing to these and other research outcomes and possible solutions will be discussed.
HIV/AIDS, SUBSTANCE ABUSE AND MENTAL HEALTH IN RUSSIA

INSTITUTIONS
1. AIDS Foundation East West, Moscow, Russian Federation

AUTHORS
1. Sergei Koren\textsuperscript{1}, Dr., MD, sergey_koren@afew.org

Development of the HIV-epidemic in Russia has been linked historically with opioid addiction. Opioid addiction is one of the main mental health disorders that correlate with HIV-infection and it requires specialized treatment.

Research shows significant differences in the standards of medical care for patients with a double diagnosis of HIV-infection and drug addiction at the narcological dispensaries and AIDS Centers in terms of double stigmatization of patients, narrow specialization of psychiatric (narcological) infectious diseases services, low awareness among psychiatrists-narcologists about HIV-treatment and lack of substitution treatment.

In this regard, narcological and infectious diseases clinics should address the need for complex treatment in order to attract and keep drug users with HIV in therapy programs. One urgent problem to be addressed in providing care to patients with double diagnosis is assuring continuity and effective collaboration between AIDS centers and narcological services.

The quality of medical services for people with double diagnosis can be improved by:
- increasing access to psychiatric help through infectious diseases clinics taking into account the needs of the affected community
- increasing access to ARVs for HIV-patients at psychiatric clinics
- providing additional training for medical personnel
- supporting NGOs and self-help groups
- helping people with double diagnosis
- attracting the involved community into monitoring and evaluating the quality of medical and social services

MENTAL HEALTH CARE FOR PEOPLE LIVING WITH HIV AND AIDS IN SERBIA

INSTITUTIONS
1. International Aid Network, Belgrade, Serbia and Montenegro

AUTHORS
1. Marina Stojanovic\textsuperscript{1}, Ms., mstojanovic@ian.org.yu

The Serbian expert center on mental health and HIV is a part of the Network initiated by GIP. During implementation of the activities mental health of PLHIV was addressed, through training of professionals, research activity, publications and advocacy. The results of center engagement and research studies reveal that in Serbia mental health of PLHIV is neglected field. Holistic approach in treatment and care is lacking, as participation of PLHIV in advocacy efforts for their entitled rights.

Research shows that numerous stressors have a negative impact on the quality of life and mental health of PLHIV, as well as their ability to cope with the problems.

The most frequent problems with mental health for PLHIV are grief and depressive feelings, followed by anxiety, restlessness and side effects from the use of ART.

PLHIV do not approach existing mental health services, which are underdeveloped and not specialized to meet psychological needs of PLHIV. High level of stigma among health workers presents a great barrier to approaching health services for PLHIV and provokes worry and stress about getting medical treatment when they are in need.

Mental health services and HIV treatment in Serbia are not connected. It seems that the need for linking these services is not recognized among AIDS treatment center, mental health services and PLHIV themselves. The doctors who treat HIV are solely responsible for psychiatric treatment of AIDS patients. There is a need to sensitize all three sides in order to achieve better response.
ACUTE INPATIENT CARE IN EUROPE: PROBLEMS AND PERSPECTIVES

INSTITUTIONS
1. Health Care Research Agency, Bologna, Italy

AUTHORS
1. Giovanni de Girolamo, Dr., Md, gdegirolamo@regione.emilia-romagna.it

The phasing out of mental hospitals and the gradual expansion of General Hospital Psychiatric Units (GHPUs) as main setting for inpatient acute care has created new problems and new needs. Recently important studies and development projects have attempted to investigate the main problems faced by GHPUs and have proposed a number of solutions. The aim of this symposium is to present important experiences done in the area of acute inpatient care in four European countries (e.g., Germany, Italy, Norway and the U.K.).

ACUTE PSYCHIATRIC HOSPITAL CARE IN GERMANY - DOES IT MEET THE NEEDS?

INSTITUTIONS
1. Central Institute of Mental Health, Mental Health Services Research Group, Mannheim, Germany

AUTHORS
1. Hans Joachim Salize, Dr, MD, salize@zi-mannheim.de

Germany turned towards community-based mental health care in the mid seventies, when deinstitutionalisation of mental hospitals and asylums started. From 1970 up to now, the number of psychiatric beds was cut by roughly half to less than 80,000 today. The process was affected but not stopped by the reunification of East and West Germany in 1990, when the East German mental health care system had to be integrated and improved. In 2003 psychiatric beds in Germany numbered a mere two thirds of the capacity in 1991, the first year as a re-unified Germany, when psychiatric beds in East and West Germany.

Although very few mental hospitals have been closed down during this process, most of them have decreased significantly in size and changed their focus towards regionalised acute hospital care alongside a growing number of psychiatric wards at general hospitals. Currently there is, approximately, a 50:50 divide in terms of the overall numbers of inpatient care episodes between acute psychiatric units at general hospitals and mental hospitals. Though mental hospital beds still outnumber general psychiatric ward beds, psychiatric hospitals in Germany today have less in common with the old-fashioned asylums of the pre-reform days, and are well-equipped and well-staffed facilities providing specialised psychiatric care. However, a key characteristic of the German system - the wide gap between inpatient and outpatient services, which are usually funded separately and staffed by different teams - is still prevailing. The presentation describes and discusses advantages and pitfalls of this situation.
INPATIENT CARE IN ITALY: OVERVIEW OF THE FINDINGS OF A NATIONAL SURVEY, THE PROGRES-ACUTE PROJECT

INSTITUTIONS
1. Health Care Research Agency, Emilia-Romagna Region, Bologna, Italy
2. University of Cagliari, Department of Psychology, Cagliari, Italy

AUTHORS
1. Giovanni de Girolamo1, Dr, Md, gdegirolamo@regione.emilia-romagna.it
2. Antonio Preti2, Dr, Md, apreti@tin.it

Aims: In Italy, all Mental Hospitals have been replaced by a full range of community-based services, including General Hospital Psychiatric Units and other inpatient facilities. This presentation will summarize the results of the PROGRES-Acute project, a national survey of all Italian public and private acute inpatient facilities.

Methods: In Phase 1 structured interviews were conducted with each facility’s head psychiatrist in all regions. In Phase 2 socio-demographic, clinical, and treatment information were collected for approximately 3,000 patients admitted to or discharged from 130 public and 36 private inpatient facilities during an index period in the year 2004. All patients were also rated using the 24-item BPRS and the GAF rating scales.

Results: Overall, Italy (except Sicily) has a total of 4,108 public inpatient beds in 319 facilities, with 0.78 beds for every 10,000 inhabitants, and 4,862 beds in 54 private inpatient facilities, with 0.94 beds per 10,000 inhabitants. Many inpatient facilities showed significant limitations in terms of architectural and logistic characteristics. Staffing showed a great variability among facilities. In phase 2 it was found that non-affective psychoses (36%) were the most common diagnoses and accounted to a large extent for compulsory admissions.

Conclusions: In Italy the number of acute beds per 10,000 is one of the lowest in Europe. Despite the crucial role of inpatient care, many features of care are unsatisfactory, and many problems still await appropriate solutions. Family support represents an important resource for most patients, and interventions specifically addressed to relieving family burden are warranted.

CHARACTERISTICS OF PATIENTS AND WARDS IN EMERGENCY PSYCHIATRIC DEPARTMENTS, AND POSSIBILITIES FOR REDUCTIONS IN UTILISATION OF ACUTE INPATIENT SERVICES

INSTITUTIONS
1. Akershus University Hospital, Division of Mental Health Services, Oslo, Norway

AUTHORS
1. Torleif Ruud1, Dr, MD, torleif.ruud@medisin.uio.no

Objectives: Multi-centre study of acute psychiatry (MAP) in Norway was done by a network of acute mental health services, supported by the National Board of Health, and coordinated by SINTEF Health Research. The aim was to get more systematic data on acute psychiatric services, acute treatments and patients receiving these treatments.

Methods: The study is a prospective, explorative and comparative study. Data on all admissions during three months in 19 of the 23 acute psychiatric departments in Norway were included. 3506 patients were followed from admission to discharge with data collection on admission process, socio-demographics and clinical state at admission, assessments, treatments, contact with other services, coercion, suicidality, violence, clinical state at discharge and the discharge process. HoNOS and split version of GAF were rated at admission and discharge. Data were also collected on resources, competence and clinical practice for each ward.

Results: Analyses show significant variations among acute wards regarding patient characteristics at discharge, length of stays, coercion, outcome, resources and clinical practice. One of four patients was admitted within 30 days after a previous stay, and one in five could probably have managed with an alternative type of care, but there were significant variations between wards regarding these figures.

Conclusions: Reductions in the utilisation of acute psychiatric inpatient services may be possible by implementing actions based on the results shown by multi-centre study.
In response to concerns about the poor quality of acute psychiatric wards in the UK, the Royal College of Psychiatrists established a professionally led system for accrediting acute inpatient mental health services (AIMS). This was done in partnership with the UK professional bodies for nurses, occupational therapists and psychologists. We developed a set of standards relating to service organization and delivery based on best available evidence and national guidance. Participating wards undertake a self-review, which includes structured feedback from staff and patients, against these standards and then receive a visit by an external, multi-professional, peer-review team that includes a patient. By the end of 2007 more than 100 acute wards had enrolled for the accreditation programme. Despite being self-selected, many wards fail to meet the standards and have to take corrective action to achieve accreditation. This presentation will describe the accreditation system and summarise the aggregated findings of the wards that have completed the accreditation cycle.

The Northern European Region is characterised with its longstanding tradition to a welfare model with emphasis on public services. Despite similarities the various countries in the region have in the development of their mental health services chosen different models. The symposium will provide an overview of the situation in Zone 7.

1. the various organisational models, their advantages and shortcomings.
2. the main issues in the current debate related to the provision of mental health services as well as
3. the most significant challenges the profession is facing in the country.
MENTAL HEALTH SERVICES IN FINLAND: PROBLEMS AND CHALLENGES

INSTITUTIONS
1. Department of Psychiatry, University of Turku, Harjavalta hospital, Finland

AUTHORS
1. Jyrki Korkeila¹, Dr, jyrki.korkeila@fimnet.fi

In Finland the mental health service system underwent a rapid and partly uncontrolled transition within the last twenty years. Three fourths of the beds were closed down. Patients are expected to use outpatient services. Thousands of patients with chronic severe mental disorders live in housing services based on private entrepreneurship, but that may lack adequate resources for treatment. The changes in the act of specialized health care and the primary health care act a decade ago transferred the responsibility for organizing health care to local authority municipalities across the country. This led to a highly decentralised system unable to guarantee continuity of treatment. The decentralisation has led to various models of service provision and regional inequities. The development of mental health outpatient care was hampered by economic recession in the beginning of the 1990s, and by financial problems of municipalities. There is a lack of psychiatrists in the public care. Efforts to warrant treatment for people suffering from non-acute illnesses has set challenges for the whole health care system in 2005, but this has not been for the benefit of psychiatric patients. A national project - Mind 2009 - to establish some form of stipulated criteria for high quality service provision is being carried out. Another project will seek for means to cut down disability pensions due to major depression. Major depression has been the leading singular cause for new disability pensions.

SWEDISH PSYCHIATRY CHANGES

INSTITUTIONS
1. Norra Stockholm psykiatri, Sweden

AUTHORS
1. Christina Spjut¹, Dr, MD, christina.spjut@comhem.se

The number of psychiatrists in Sweden will diminish during the forthcoming years both because of the aging of the psychiatrists and because many psychiatrists leave their positions for other jobs. In many parts of Sweden there are also problems to recruit psychiatric trainees.

Recent political decisions will result in changes in psychiatry in Sweden. Until now practically all psychiatric services have been provided by county owned clinics. Politicians in several important regions/counties (Stockholm, Malmö) are now preparing for privatization.

Changes in the Compulsory Psychiatric Care Act (LPT) are planned so that persons with serious mental disorders can be treated in outpatient care according to this law.

Quality registers are growing. Right now there are four registers in use: Bipolar disorders, eating disorders, schizophrenia and ADHD. Many providers demand that the patients be registered. This means that we soon will have quite good data to present from the registers of eating disorders and bipolar disorders in particular.
MENTAL HEALTH SERVICES IN ESTONIA: PROBLEMS AND CHALLENGES

INSTITUTIONS
1. Estonian Psychiatric Association, Estonia

AUTHORS
1. Andres Lehtmets, Dr, MD, andres.lehtmets@ltkh.ee
2. Veiko Vasar

The mental health system in Estonia has survived the difficulties of the 90s that can be described as transformation to a new model of service provision. We are now sharing the most common problems of the European health care services: lack of physicians and long waiting lists.

We are still long behind the numbers of psychiatrists compared to the Nordic countries (12 -13 /100 000 of population). The number of trainee posts has doubled over the last years; however the majority of the newly trained psychiatrists prefer to seek for jobs outside (in 2006 100 % of the graduates left Estonia). The main motivator is the salary, but also work environment and possibilities for further specialisation.

There is a rise in the number of outpatient visits. The leading causes for seeking specialist care in psychiatry are depression and anxiety disorders. It should however be noted, that some 53 % of the patients with depression are diagnosed by family doctors and only 36% by psychiatrists. There is a 1.5 fold increase in the prescriptions of antidepressants from 2002 - 2006. Suicides among men are still worrying, although numbers have gone down the last years. We are still ranking high with our neighbouring countries.

LACUNAE IN MENTAL HEALTH LEGISLATION AND DIFFERENCES BETWEEN REGIONS IN FINANCING AND SERVICE PROVISION ARE PROBLEMS FOR THE POLITICAL LEVEL OF DECISIONMAKING.

Psychiatry keeps on fighting for its place in the sun with other specialties.

LITHUANIAN MENTAL HEALTH CARE REFORM: ACHIEVEMENTS AND CHALLENGES

INSTITUTIONS
1. Lithuanian Psychiatric Association, Lithuania

AUTHORS
1. Nijole Midttun Gostautaite, Dr, MD, nogomi@hotmail.com

The objective of this analysis is to present the development of mental health care system in Lithuania (1991-2007) and reflect on the role of Lithuanian Psychiatric Association in this process. Methods include analysis the statistical data and policy documents.

Mental health reform in Lithuania has started in 1994 and resulted in improved access to services, expanding outpatient services and preventive activities. The most recent developments include The National Mental Health Strategy and Action plan (2007). There are several important challenges rooted in history of Lithuania and recent joining of European Union, such as: deteriorating mental health indicators, reform of primary health care system (removing competition between GPs and mental health services for per capita financing), improving integration of services and responding to growing shortage of mental health specialists. Lithuanian Psychiatric Association has played active role in the reform, as institution and through individual members. It continues to engage in this debate through partnership with Lithuanian Health Care Ministry. Lithuania and other new European Union members are facing similar challenges; therefore sharing experiences and comparing outcomes could provide guidance for further progress in psychiatry in Europe.

PRE-EMPTIVE PSYCHIATRY: STRATEGIC DEVELOPMENTAL CORNERSTONES

INSTITUTIONS
1. Norwegian Psychiatric Association, Norway

AUTHORS
1. Jan Olov Johannessen, Dr, MD, jojo@sus.no

Norway has had an 8-year plan for strengthening the psychiatric services (2000-2008). The major elements has been to desentralise the services, and build a community-based psychiatry. As this plan-period now comes to an end, the Norwegian Psychiatric Association has launched a 10-point strategic program for the future development of the psychiatric services in Norway. The major elements of this proposal will be outlined and discussed. In summary, the 10 points are:
1. A long-term national strategy for antistigma and public information.
2. Psychiatric disorders can be prevented. A strategy for the prevention of serious psychiatric disorders.
3. Obligatory education on mental health in high-schools.
4. A national plan for early detection and intervention in serious psychiatric disorders in young people.
5. Easy access/low threshold services, available when you need them.
6. A national plan for development of professional skills.
7. Secure and expand the place for psychotherapy and other psychosocial treatment modalities.
9. Users’ participation/the right to meaningful employment.
10. The measure for quality is our treatment results and patients’ satisfaction (focus on result quality indicators like DUP (duration of untreated psychosis)).

MENTAL HEALTH SERVICES IN DENMARK: STATUS AND CHALLENGES - AN UPDATE

INSTITUTIONS
1. Centre transcultural psychiatry, psych, Denmark
2. Dept Psychiatry, psychiatry, Frederiksberg, Denmark

AUTHORS
1. Marianne Kastrup, Dr, MD, marianne.kastrup@rh.regionh.dk
2. Dorte Sestoft, Dr, MD, PhD, dorte@sestoft.dk

The presentation is an overview of the Danish Mental Health system including the organisation of outpatient treatment of non-psychotic psychiatric disorder, community psychiatry, specialised treatment in the psychiatric wards, legislation and forensic psychiatry. Psychiatry today is in a paradoxical position: Its integration into the medical frame of reference is challenged by the community at the same time as the biomedical/molecular approach to pathogenesis of disorders is increasingly successful.

A major challenge is how to improve the image of psychiatry among in the population in general and especially among doctors and patients. Main issues are: decreasing the use of coercion to an absolute minimum, stopping an ongoing explosion in the number of forensic patients, focus on medical professionalism, involving patients in evaluating of the mental health system and plans for handling serious problems with recruitment within psychiatry.

4. Marco Scarpinati Rosso⁴, Dr, MD, marco.scarpinati-rosso@sll.se

Objective of the Symposium
The challenge for diagnostic systems and methods to respond to diversity and context will be discussed. Research on developing patient-centred methods for considering culture in psychiatric diagnosis will be presented.

UNIVERSALITY VERSUS LOCAL ADAPTATIONS OF CULTURAL SYSTEMS

INSTITUTIONS
1. Rigshospitalet, Vidensenter, Copenhagen, Denmark

AUTHORS
1. Marianne Kastrup¹, Dr, MD, marianne.kastrup@rh.regionh.dk

Do diagnoses give meaning in the specific cultural setting and are they compatible with the cultural values of the patient as well as the psychiatrist? In recent years, we have witnessed an upsurge in the attention paid to the limitations in the international classifications as inadequately reflecting the cultural dimensions of the condition. Several reasons may be given to this concern including the increasing recognition and respect of the cultural background of the patient, though some find focusing on the cultural differences a hindrance for understanding the disease process.

In the discussion of the universality of diagnostic systems some adhere to the universality of diagnostic systems independent of cultural context and the need and possibility to develop a set of categories and guidelines applicable and acceptable around the world. They tend to see the condition to be diagnosed as a reflection of a universal psychopathology. Others are of the opinion that cultural adaptations of the diagnostic categories are useful and needed. They reflect a cultural relativism and tend to see conditions arising from a given cultural setting.

The DSM-IV cultural formulation is an example of a way to combine a diagnostic classification system with a cultural dimension. The Chinese adaptation of the ICD-10 is an example of a way to take an international classification system and adjust it according to a given cultural setting.
RETHINKING PSYCHIATRIC ASSESSMENT FROM INDIGENOUS PERSPECTIVES

INSTITUTIONS
1. McGill University, Division of Social and Transcultural Psychiatry, Montréal, Canada

AUTHORS
1. Laurence J Kirmayer¹, Dr, MD, laurence.kirmayer@mcgill.ca

This presentation will review ethnographic studies of resilience among Indigenous peoples in Canada to identify issues relevant to psychiatric assessment and diagnosis. Focus groups and life narrative interviews with participants from several First Nations and Inuit groups identified cultural models of suffering, resilience, and healing. Collective experiences of colonization, sedentarization, cultural suppression, and forced assimilation have given rise to forms of suffering that are increasingly understood as manifestations of 'historical trauma'. This attribution locates individual suffering in larger social and political contexts.

Cultural variations in the concept of the person based on traditional ontologies influence illness explanations and illness experience. Many indigenous people have a relational notion of the self that locates the origins of mental health problems and their solutions in connections to other people, the environment or a spiritual level of experience. For some communities living close to the land, the person is understood as being in constant transaction with the natural environment; hence, the condition of the land is closely linked to individual wellbeing. Many individuals find strength in forms of spirituality that affirm cultural identity. Certain symptoms may be recognized as indicating 'spiritual' problems. Systematic attention to these dimensions of indigenous history, identity, and experience can guide assessment in ways that lead to more accurate diagnosis and appropriate treatment. Indigenous models of resilience may provide a potentially useful supplement to psychiatric nosology.

CONSTRUCTING A MANUAL IN SWEDISH FOR USING THE CULTURAL FORMULATION IN DSM-IV

INSTITUTIONS
1. Stockholm County Council, Transcultural Center, Stockholm, Sweden

AUTHORS
1. Sofie Baarnhielm¹, Dr, MD, PhD, sofie.baarnhielm@sll.se

Objective
To present background and experiences of formulating a manual in Swedish to support clinical application of the Outline for a Cultural Formulation in DSM-IV (OFC).

Methods
The OFC is a model to support a systematic review of culture and context in psychiatric diagnosing. The model is ideographic, suggesting an ethnographically inspired narrative approach to interviewing for exploring the individual patient’s perspective on culture, context and clinical interaction. To be a structured model for clinical use, it needs to be developed into practical guidelines for clinicians. With the aim of producing guidelines in Swedish, a qualitative research project was conducted. Interview questions were formulated, and reformulated, in interaction with clinical application of the OFC for 30 patients; the responses were subjected to a content analysis (n 23).

Results and Conclusion
The constructed manual will be presented. Results of the application point to the value of ethnographically inspired interviewing in psychiatric diagnosing as a method for obtaining an insight into the patient’s cultural life context and perspective on illness and treatment. This can contribute to a better overall understanding of distress, besides improving the validity of nosological categorisation. The further work on implementing the manual in clinical practice will be discussed.

Baarnhielm, S., & Scarpinati Rosso, M. (in revision). The cultural formulation - a model to combine nosology and patients’ life context in psychiatric diagnosing, Transcultural Psychiatry.
APPLICATION OF THE CULTURAL FORMULATION IN SWEDEN

INSTITUTIONS
1. Stockholm County Council, Transcultural Center, Stockholm, Sweden

AUTHORS
1. Marco Scarpinati Rosso
   Dr, MD, marco.scarpinati-rosso@sll.se

Objective
To present results of the clinical application of the Swedish Manual for Cultural Formulation.

Methods
In accordance with the DSM-IV’s Outlines for Cultural Formulation, a semi-structured question manual has been developed and adapted to the Swedish social context. The Manual has been applied to 23 immigrant patients newly referred to an Outpatient Psychiatric Clinic located in a multicultural suburban area of Stockholm. The enrolled patients have been interviewed in two steps - traditional assessment (including SCID I, clinical version) and cultural formulation oriented interview - by two different clinicians. The cultural formulation interviews have been tape recorded and analyzed with the content analysis technique. The information obtained has been systematically analyzed (quantitatively and qualitatively) in order to evaluate the contribution of the Cultural Formulation interview.

Results
The clinical data have been discussed by the clinicians with a view to considering eventual modifications of diagnosis, treatment plan and psychosocial interventions. Preliminary results show that cultural factors play an important role not only in the diagnostic assessment but also in the process of building the therapeutic alliance and addressing the treatment on an individual basis.

Conclusions
It seems that the cultural formulation can function as a bridge between the needs of a systematic diagnostic categorization and a deeper comprehension of the patient in the stream of Person Centered Psychiatry.

Non Governmental Organizations are recognized as more sensitive to local and regional realities and they frequently are more compromised to produce changes. The mission of the International Psychogeriatric Association is “to improve the mental health of older people everywhere through education, research, professional development, advocacy, health promotion, and service development.” Some of the IPA vision principles support the advocacy mission and sets the way to develop it:
- multidisciplinary approach,
- regional representation,
- consultancy programs,
- dissemination of knowledge and information,
- the use of technology to disseminate information,
- focus on operating issues,
- providing the healthcare community with the service provisions and guidelines,
- provide information and assistance to patients and caregivers.

The goals of the present symposium are to:
I. Present two recent IPA activities related to its advocacy mission:
   I.1. The Focus Groups Project to explore the differences in the diagnosis and treatment of dementia in various regions of the world, and to examine the barriers to dementia care. The results of two regions will be presented (Asia and Europe);
   I.2. The collaborative project between Alzheimer’s Disease International (ADI) and the International Psychogeriatric Association (IPA) in order to improve the diagnosis and treatment of AD throughout the world.
II. Promote a debate on the advocacy role of NGOs in the field of Mental Health in Old Age.
DIAGNOSIS AND TREATMENT OF DEMENTIA IN ASIA

INSTITUTIONS
1. President of the International Psychogeriatric Association, Department of Psychiatry, The Chinese University of Hong Kong, Hong Kong, Hong Kong Special Administrative Region of China
2. Member of the Board of Directors, International Psychogeriatric Association, Department of Psychiatry, Sunnybrook Health Sciences Centre, University of Toronto, Toronto, Canada

AUTHORS
1. Helen Chiu¹, Dr., MD, PhD, helenchiu@cuhk.edu.hk
2. Kenneth Shulman², Dr., MD, PhD, ken.shulman@sunnybrook.ca

A recent study estimated that there were 24 million people suffering from dementia in the world in 2001, and this would increase rapidly in the coming years (1). However, services for people with dementia are not very well developed in many places, especially developing countries. Hence dementia care will soon become a major public health issue in many countries. As part of the Advocacy Initiative to improve dementia care, the International Psychogeriatric Association (IPA) has organized several focus groups in Europe and Asia. The aim of the focus groups is to explore the differences in the diagnosis and treatment of dementia in various regions of the world, and to examine the barriers to dementia care. This paper will present the findings of the Asian Focus Group. In general, awareness of dementia is low. There are long delays in the process of diagnosis and treatment and various barriers to dementia care in many countries in Asia. In addition, there is a wide variation in prescription of anti-dementia drugs and atypical antipsychotics as well as provision of community facilities. The findings of the focus groups are discussed in the light of how to improve care for people with dementia.

DIAGNOSING AND TREATING OF ALZHEIMER’S DISEASE (AD) IN EUROPE: THE RESULTS OF FIVE IPA CONDUCTED FOCUS GROUPS

INSTITUTIONS
1. Treasurer of the International Psychogeriatric Association, Medical University of South Carolina, Charleston, United States

AUTHORS
1. Jacobo Mintzer¹, Dr., MD, mintzerj@musc.edu

Surveys show consistent agreement among clinicians, government and consumers (patients and caregivers), that AD patients deserve prompt diagnosis and the best available treatment. What the parties disagree on is what prompt diagnosis means and what the best available treatment is. To answer this question IPA in conjunction with our corporate partner Myriad Pharmaceuticals conducted five focus groups with representative care providers from five European countries (Spain, France, Germany, Italy, and the UK). The focus groups included 5 to 10 participants. The methodology allowed for some introductory remarks followed by broad questions aimed to stimulate discussion on the topic of interest. The groups showed vast differences in the diagnostic approach and type of treatment provided in each of the countries. The general tendency was to delay diagnosis and restrict treatments. This tendencies were always driven by budgetary concerns. Some of the counties show more open access to diagnosis and treatment such as Germany and France and others show more limitations such as the UK. It was concluded that in order to address all party needs action should be taken to identify cost sensitive approaches to improve diagnosis and treatment of AD in this countries. This information jointly with similar survey data presented by Alzheimer’s Disease Europe prompted for the public policy initiative that will be here presented.
IMPROVING THE DIAGNOSIS AND TREATMENT OF ALZHEIMER’S DISEASE THROUGHOUT THE WORLD

INSTITUTIONS
1. Member of the Board of Directors, International Psychogeriatric Association, VU University Amsterdam, Program on Aging, Utrecht, The Netherlands
2. Executive director, Alzheimer’s Disease International, London, United Kingdom
3. Executive Director, International Psychogeriatric Association, Northfield, United States

AUTHORS
1. Anne Margriet Pot1, Dr., MD, PhD, ampot@trimbos.nl
2. Marc Wortmann2, m.wortmann@alz.co.uk
3. Susan Oster3, Mrs., soster@ipa-online.org

In the last years, several surveys among consumers of dementia care and their health care professionals have been carried out, clarifying the problems they experience. The nature of these problems show that there is little agreement on diagnosis and treatment of dementia in various regions of the world, and several barriers to dementia care. A common concern is cost containment, dealt with in different ways by different political and cultural systems. Access to care is expected to become more restrictive. The conclusion can be drawn that only a well-coordinated public policy initiative could impact the system.

Therefore, Alzheimer Disease International (ADI) and the International Psychogeriatric Association (IPA) decided to collaborate on a public policy initiative to improve the diagnosis and treatment of AD throughout the world. For the IPA, this initiative embroils on the focus group approach.

The public policy initiative will be aimed at:
a) Bringing together consumers and providers in different regions of the world
b) Jointly collect information relevant to a specific area
c) Establish, adapt and disseminate best practices

Influence decision makers to implement the established best practices

In this presentation the project will be introduced. The so-called ‘breakthrough method’ will be used to help countries to close the gap between what we know and what is done regarding the diagnosis and treatment of dementia. A structure will be created in which participants can easily learn from each other and from recognized experts in topic areas where they want to make improvements.

GENERAL AND SPECIFIC PRINCIPLES GUIDING ADVOCACY INITIATIVES IN MENTAL HEALTH & AGING

INSTITUTIONS
1. Member of the Board of Directors, International Psychogeriatric Association, CDA-IPUB, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil

AUTHORS
1. Carlos Augusto de Mendonça Lima1, Dr., MD, PhD, climasj@yahoo.com

Advocacy can be defined as a strategy for credible defense of interests. WHO-WPA (1) recognized that patient advocates may be important, as may reference to advance directives in order to protect the legal rights and financial and other personal interests of old persons with mental disorders, mainly those who are not able effectively to represent their interests, manage their affairs or agree to what is proposed for them.

A successful advocacy efforts require, among others, to:
1. motivate the decision-makers,
2. empower consumers, families and NGOs,
3. organize and launch anti-stigma programmes,
4. collaborate with the media,
5. promote programmes leading to reduce the burden of the selected disorders,
6. authoritatively inform decision-makers regarding the mental health impact of economic and social policies.

WHO recently pointed that (3):
1. awareness of dementia is very low in all world regions, a problem leading to stigmatization and inefficient help-seeking.
2. governments, NGOs working in the area of Alzheimer and other dementias, professionals and carers need to work together to raise awareness, counter stigma and improve the quality and coverage of care services.

This communication will address the principles guiding advocacy initiatives in Mental Health & Aging and present some of these initiatives developed by different NGOs.

TOUCHING THE ELEPHANT - THE DIFFERENT BUT COLLABORATIVE OVERLAPPING ROLES OF INTERNATIONAL ORGANIZATIONS IN IMPROVING DEMENTIA CARE

1. Chair of the World Psychiatric Association Section in Old Age Psychiatry, Academic Unit for Psychiatry of Old Age, University of Melbourne, Melbourne, Australia

AUTHORS
1. Edmond Chiu1, Dr., MD, PhD, edmond.chiu@svhm.org.au

Dementia Care demands a comprehensive multidisciplinary approach and commitment to collaboration and cooperation of the persons with dementia (PWD), their carers and advocates, health professionals and policy makers. While each group may only see an aspect relevant to its primary objective (as in the parable of the blind touching different parts of the elephant) the care of the PWD can not, and should not be parcel up into isolated and compartmentalised disconnected bits. Therefore, the collaboration of all groups - ADI representing PWD, carers and their advocates; IPA with its multidisciplinary focus; and WPA Section in Old Age Psychiatry of psychiatrists committed to the practice of Old Age Psychiatry, can work together to ensure the best quality of life and the best quality of care for all PWD and their carers. This paper will address this issue and highlight some historical and recent examples to demonstrate such a working relationship. Some future directions will also be offered.

3. Peter Lehmann2, Mr, mail@peter-lehmann.de
4. Helen Herrman3, Professor, H.Herrman@unimelb.edu.au

In order to move beyond a reductionistic model of mental illness towards including a focus on health promotion and recognizing the centrality of the person with regard to diagnosis, care, research and public health action all interested parties need to cooperate. This symposium will highlight ideas for a development from treating an illness towards caring for the person from different perspectives.

The WPA Institutional Program on Psychiatry for the Person (IPPP) has set out to affirm the whole person of the patient in context as the centre and goal of clinical care and health promotion, at both individual and community levels. Juan Mezzich, President of the WPA, will start with an overview on ways to address positive health in addition to ill health and their implications for a person-centered approach to diagnosis and mental health care. Sigrid Steffen from EUFAMI will present perspectives on the carers’ interest and involvement in such an approach. Peter Lehmann ENUSP will suggest and discuss the value of supports towards enabling people to care for themselves. Finally, Helen Herrman will highlight the crucial role of ethics with regard to research under the consideration of caring for the person.
THE ROLE OF POSITIVE HEALTH IN CARING FOR THE PERSON

INSTITUTIONS
1. Mount Sinai School of Medicine, New York University, International Center for Mental Health, New York, United States

AUTHORS
1. Juan E. Mezzich¹, Professor, juanmezzich@wpanet.org

Context: Medicine at large and psychiatry in particular are professions committed to helping people restore and promote their health. In fact, health promotion, in addition to health restoration (disease cure, alleviation or management), is increasingly recognized as a proper and important task of clinical care.

Objectives: Concepts of positive health, as opposed to ill-health, will be examined as well as some of its dimensions and its implications for comprehensive diagnosis and care.

Key messages: Health, a precious human concern, constitutes a wide-ranging condition and experience. Positive health combines with pathology or illness to yield a broader concept of health, etymologically anchored on the concept of wholeness and enshrined in WHO’s constitution. The most recognized aspects of positive health include functioning/resilience, resources/supports and quality of life. Systematic assessments of positive health can be incorporated into comprehensive diagnostic models that by attending to the totality of the person who consults may enhance effectiveness and ethics in diagnosis and care.

Conclusion: Interaction with the whole person - including positive as well as ill aspects of health - is a core feature of a person-centered approach to mental health care.

THE NEED FOR THE INVOLVEMENT OF FAMILIES IN A NEW CARE ENVIRONMENT

INSTITUTIONS
1. European Federation of Associations of Families of People with Mental Illness (EUFAMI), Executive Committee, Leuven, Belgium

AUTHORS
1. Sigrid Steffen¹, Mrs, aha-salzburg@hpe.at

There is a definite need for a new care environment - away from the conventional long term hospital model to a more community and mobile care centred model. In addition, there is a need for a more total holistic encompassing all aspects of the patient's health. With concepts like Empowerment and Recovery new responsibilities and roles arise, for clinicians, users, cares and public policy. This implicates new requirements to the abilities and possibilities of these affected parties.

EUFAMI is leading the campaign to ensure that families are listened to and that the large knowledge base which families has built up from years and years of 'on the spot' experience of living with mental illness is shared by all of the care team; hence the need to have families officially as an integral part of any care team.

Also there is a need for a review of how professional staff are trained in order to include ‘family training’ on the official training curriculum.
FROM CARING FOR THE PERSON TO SUPPORT PEOPLE TOBE ABLE TO CARE FOR THEMSELVES

INSTITUTIONS
1. European Network of (ex)-Users and Survivors of Psychiatry (ENUSP), Board, Berlin, Germany

AUTHORS
1. Peter Lehmann¹, Mr, mail@peter-lehmann.de

Context: Caring for a person who is disabled to care for him- or herself is a human approach, which cannot be appreciated enough. Making people disabled and helpless first and then starting to discuss how to care for them is an approach, which seems not optimal.

Objectives: This lecture will raise awareness about the problem, that on the one hand disability can be produced by traumatization through forced treatment, by administering electroshock and psychiatric drugs which can alter the personality and produce a lot of dangerous effects on the long run. On the other hand, support systems should be known, started, financed and supported, which do not disable people with emotional distress.

The speaker will highlight a number of alternative initiatives which are current in places like France, e.g. La Maison d’Espérance as well as a project in the South of France.

Key Message: World-wide there are a lot of proven support systems and approaches which enhance self-help abilities and provide social and juristic support to enable people to care for themselves, for example the Personal Ombudsman in Skåne. And there are a lot of functioning alternatives like Windhorse, Soteria for people with emotional stress which prevent disability and support recovery from emotional distress and iatrogenic diseases or even, like the Open Dialogue, to prevent forced psychiatric treatment, mostly the starting point of traumatization and iatrogenic disability.

Conclusion: Forced psychiatric treatment should be abolished. And - fitting to a society with claims to be democratic - freedom of choice and alternatives beyond psychiatry should be available.

THE ETHICS OF PSYCHIATRIC RESEARCH AND CARING FOR THE PERSON

INSTITUTIONS
1. ORYGEN Research Centre, University of Melbourne, Department of Psychiatry, Melbourne, Australia

AUTHORS
1. Helen Herrman¹, Professor, H.Herrman@unimelb.edu.au

Research and its dissemination are important to improving and maintaining standards of care for people living with illness and disability and their families. Psychiatric research involving vulnerable persons that is expected to offer little or no individual benefit remains a controversial and difficult problem.

Psychiatric research shares these concerns with health and medical research in general. People may be vulnerable because of - Legal ‘incompetence’ deriving from medical conditions such as dementia, intellectual disability or some instances of severe mental illness, or
- Adverse social and economic conditions that increase the risk of coercion, lack of fully informed consent or personal hazard from involvement in the research.

International policies lead by the Declaration of Helsinki provide essential guidelines for researchers, users, families and governments and the development of policy and regulations in countries. The paper will consider a framework to review a research project’s
- Scientific soundness
- Informed consent and
- Privacy, safety and wellbeing of participants

and consider examples from psychiatric and mental health research in high- as well as low-income countries.

The extreme example of the experience of the involvement of medical researchers in crimes against humanity in National Socialist Germany, particularly the murder and forced sterilisation of people categorised as chronically mentally ill, leads to consideration of our current knowledge about the mechanisms of becoming involved in such unethical behaviour.

SUCIDE PREVENTION IN ASEAN: 10 YEARS AFTER ASIAN ECONOMIC CRISIS

INSTITUTIONS
1. Prince of Songkla University, Department of Psychiatry, Faculty of Medicine, Hat Yai, Songkhla 90110, Thailand

AUTHORS
1. Pichet Udomratn¹, Prof., MD, upichet@medicine.psu.ac.th

According to the WHO, there have been more than five million suicide deaths worldwide in this century. Large increases in suicide rates have been seen in the last decade not only in the West but also the East, especially in those Asian countries which were affected by the 1997 economic crisis. This crisis started in Thailand before spreading to Indonesia and other countries. The rising suicide rates have been of growing concern for the communities and governments in the ASEAN countries. Many suicide prevention strategies have been implemented in Thailand, Malaysia, Singapore and Philippines. In this symposium, participants will learn about various interventions including the early detection and treatment of mental disorders, increases in access to mental health services, increases in mental health literacy and public education, reduction in access to means, media strategies, and crisis support service from a multi-disciplinary team. Results of national suicide prevention programmes of each country will be discussed.

There will be 4 topics and speakers in the symposium as following:
- Pichet Udomratn (Thailand) - Suicide Prevention in Thailand
- Hussain Habil (Malaysia) - Managing Suicidal Patients: A Malaysian Experience
- Hong Choon Chua (Singapore) - Suicide Prevention in Singapore: The National Response
- Felicitas I. Artiaga-Soriano (Philippines) - Suicide Prevention in Philippines

3. Gabor Gambos³, Mr
4. Pedro Montellano⁴, Mr, pmontellano@espacos-negocios.com

The Health Ministers of the WHO European zone held a conference about mental health in Helsinki, from the 12th to the 15th of January 2005. A declaration and an action plan concluded the conference. Two of the five priorities pointed out in these documents concern:

- "Design and implement comprehensive, integrated and efficient mental health systems that cover promotion, prevention, treatment and rehabilitation, care and recovery" and "recognize the experience and knowledge of service users and carers as an important basis for planning and developing services."

The latest developments and most important topics of discussion regarding these European goals with a focus on a participatory approach towards the planning and development of care will be presented and discussed by policy makers - Matt Muijen, WHO Europe and psychiatrists - Michaela Amering, and Gabor Gambos representing the European Network of (ex-) Users and Survivors of Psychiatry; the Global Alliance of Mental Illness Advocacy Networks with Pedro Montellano and Stanislas Filliol from the European Federation of Associations of Families of People with Mental Illness (EUFAMI). Presentations will highlight experiences and challenges with regard to current chances and limits of the essential roles which the Helsinki conference has sketched for all partners.
WHAT THE WHO IS DOING TO SUPPORT THE BURDEN OF CARING

INSTITUTIONS
1. World Health Organisation (WHO), European Sector, Copenhagen, Denmark

AUTHORS
1. Matt Muijen¹, Dr, mfm@euro.who.int

The WHO Regional Office for Europe is developing activities aiming to support the burden of caring following the Helsinki Declaration. The awareness of the burden of disease due to mental disorders is high, the highest contributor in many Western countries. This ignores the burden of caring. The cost of caring forms a very substantial proportion of cost of mental illness to society. The response of mental health services is not always adequate. A particular challenge in addition to the burden of caring is the stigma and discrimination experienced by family members. Mental disorders of individuals can therefore lead to a cycle of social exclusion and depression extending beyond the individual. Mental health systems have to develop adequate models of treatment and support, building on some good practice examples.

THE SPECIAL ROLE OF THE FAMILY IN THE CARE PLAN OF USERS

INSTITUTIONS
1. European Federation of Associations of Families of People with Mental Illness (EUFAMI), Executive Committee, Leuven, Belgium

AUTHORS
1. Stanislas Filliol¹, Mr, stanislas.filliol@orange.fr

A declaration and an action plan concluded the WHO sponsored Health Ministers’ conference in Helsinki in January 2005. Two of the five priorities identified the design and implementation of integrated mental health systems and the need to recognise the importance of the experience and knowledge of users and carers. The plan also defined the term carer.

In other words, and to stick to concerns which are common to all, advances are expected regarding access to treatment and care, as well as an end to partitioning with, as a result, cooperation (or coordination) between professionals belonging to different disciplines and between these professionals, users and carers.

Treatment and care are actually unfeasible without the family circle’s presence, action and proposals. Clinical and medico-economical studies relating to long term illnesses show that the family circle is not an opportunistic, more or less useful variable; it is an unavoidable component of treatment and care, observance and adaptation (not re-adaptation) to a new life.

EUFAMI fights for the implementation of those aims (access and end to partitioning). They stress that in most of the cases families care for people with mental illness, that their role should be recognised and that they should be helped. The associations are more and more listened to but, actually, their requests are far from being satisfied. This might be qualified as far as attention given to disability caused by mental illness moves faster than psychiatric practice. Militant action from the part of families, and carers in general, remains a unique incentive.
DEVELOPMENT OF CARE IN EUROPE: CURRENT HOT TOPICS FROM ENUSP’S POINT OF VIEW

INSTITUTIONS
1. European Network of (ex-)Users and Survivors of Psychiatry (ENUSP), Board, Budapest, Hungary

AUTHORS
1. Gabor Gambos1, Mr, gombokg@yahoo.com

Context: There has been a broad consensus over the past decade on the need to involve users in all aspects of mental health policy and legislation. This agreed principle, however, has not always resulted in meaningful practical steps. User involvement and human rights in mental health care thus have remained as particular and stand alone agenda items instead of being mainstreamed in the core development planning.

Objectives: The current presentation will focus on hot topics in mental health in Europe from the human rights perspective as identified by the European Network of (ex-)Users and Survivors of Psychiatry (ENUSP). Particular emphasis will be given to the right to liberty, the right to be free from torture and ill treatment, the right to informed consent and physical and mental integrity, the right to be recognised as persons with identity and agency who decide on their care and who are given support to make decisions if they require so.

Key messages: Coercion is still widespread and hundreds of thousands of European citizens are deprived of their legal capacity. In many countries long term institutionalisation is still a routine. Internationally recognised human rights cannot be respected without the meaningful involvement of users. User involvement is a right itself.

Conclusions: Respect for human dignity and mental health are intimately interrelated. User involvement is not an issue of political correctness but a principle that can help both the implementation of human rights norms and the development of humane approaches to give support to those experiencing mental health crises.

DEVELOPMENT OF CARE IN EUROPE - COMMENT FROM A USERS PERSPECTIVE

INSTITUTIONS
1. Gamian Europe, Board, Bucharest, Romania

AUTHORS
1. Pedro Montellano1, Mr, pmontellano@espacos-negocios.com

Gamian Europe represents the interests of many thousands of users of mental health services across the European countries. A large consensus has been growing in Europe, about the importance of the User’s Associations in the overall support of patients suffering from mental illness. These organisations are generally based in people that, in many different ways, have a self-experience with the illness. This characteristic provides these organisations a very peculiar knowledge and different perspective in the relations with the users, from which results important advantages in dealing with some very relevant aspects of their recovery, such as stigma.

The symposium will focus on special needs of long term treatment of unipolar and bipolar depression. The questions of long term treatment, need of comedication, problems of different age groups and pharmacoresisitency and we shall also focus on non/pharmacological issues of treatment of depressive disorders.

IS MONOTHERAPY IN THE LONG-TERM TREATMENT OF MDD POSSIBLE?

INSTITUTIONS
1. University Hospital, Department of Psychiatry, Bratislava, Slovakia

AUTHORS
1. Livia Vavrusova1, MD, PhD, vavrusova@nspr.sk

Most of the nowadays published guidelines stress the need of monotherapy in the treatment of depression. The novel antidepressants were developed to improve the treatment of depression and to make it more accessible and easier.

We analysed long-term treatment at our out-door unit to find out what are the domains that differ the patients with monotherapy from those who use combinations for the treatment of recurrent major depressive disorder.

Overall treatment of 185 patients was analysed from the point of monotherapy, combinations, psychiatric comorbidity, age, duration of the disorder, gender, education, acceptance of the MDD, compliance, number of episodes, employment and the type of antidepressant used.

Monotherapy had been preferentially used in patients under 35 years of age, with shorter duration of the MDD - less than 7 years, with patients compliant to treatment regime, acceptance of the disorder, employed and high school education. 70% of monotherapy patients were on SSRIs a these results will be discussed.

Results of this study can be used in developing strategies for the long-treatment, however cultural differences would be also interesting for future comparison.
HEART RATE VARIABILITY CHANGES IN PATIENTS WITH MIXED DEPRESSIVE-ANXIETY DISORDER

INSTITUTIONS

Background: Anxiety disorders are associated with autonomic dysregulations. Heart rate variability is caused by autonomic regulation of sympathetic and parasympathetic activity. During the anxiety or depression appears the neurovegetative dysregulation with increased sympathetic and decreased parasympathetic activity, which could be measured by HRV.

Aim: To assess the level of HRV changes in patients associated with the mixed depressive-anxiety disorder.

Method: 20 patients from the Psychiatric department JFM CU with the diagnosis of mixed depressive-anxiety disorder were included to the study. 33 students of medicine represented the control group. Short-time HRV analysis (15 minutes) was performed in the target and control group.

Results: The acquired results were divided in two groups - the first one is created by the results of the control group and the other one presents target group. Conforming the results of STAI-X questionnaire in control and target group there was a statistic very significant difference (STAI-X1 33,75 vs. 51,25, p < 0,001, STAI-X2 37,75 vs. 56,25, p < 0,001). In rMSSD (the root-mean square of the difference of successive r-R intervals mean values were in the target group significant decreased (74,42 vs. 36,65, p < 0,005) and in pNN 50 index mean values was the decrease in the target group very significant (31,36 vs. 4,4, p < 0,001).

Discussion: The results of our study suggest significant decrease of parasympathetic markers in patients with anxiety disorders; markers of sympathetic system were not changed uniformly.

TREATMENT OF PHARMACORESISTANT DEPRESSION IN CLINICAL PRACTICE

INSTITUTIONS
1. Medical Faculty Masaryk University, Department of Psychiatry, Brno, Czech Republic

AUTHORS
1. Eva Ceskova 1, Prof, MD, PhD, eceskova@fnbrno.cz
2. Libor Ustohal 1, MD, eceskova@fnbrno.cz
3. Radovan Prikryl 1, MD, PhD, eceskova@fnbrno.cz
4. Tomas Kasparek 1, MD, PhD, eceskova@fnbrno.cz

Objectives: Despite significant psychopharmacologic advances, roughly one third of the patients with major depressive disorder do not response to conventional treatments, and as many as 50% show only partial response. Aim of the study was to evaluate the use of available basic strategies for treatment of pharmacoresistant depression under routine clinical conditions.

Method: A retrospective analysis of charts of patients consecutively hospitalized between January 2005 and December 2006 at the Department of Psychiatry with the diagnoses F32-F33 (according to the ICD 10) was performed.

Results: During this period totally 78 patients with the diagnosis of depressive episode (F32) were hospitalized 85 times and 122 patients with recurrent depressive episodes 146 times. The most frequent strategy was augmentation of antidepressants with atypical antipsychotics and combinations of two antidepressants. In patients treated with a combination of dual-acting antidepressants (venlafaxine/melitracen and mirtazapine) the psychopathology and cognitive function were assessed in more details. The preliminary results have shown not only the improvement of depression but also of cognitive function.

Conclusions: Theoretical knowledge about mechanism of efficacy and various interests - from the site of patients, and their families as well as financial reasons are important for application of an AD combination and augmentation. Augmentation with atypical antipsychotics especially with quetiapine and olanzapine has increased despite of the fact that controlled studies are missing.

EFFICACY AND TOLERABILITY OF ELECTROCONVULSIVE THERAPY IN THE ELDERLY

INSTITUTIONS
1. Ludwig-Maximilian University Munich, Department of Psychiatry and Psychotherapy, Munich, Germany

AUTHORS
1. Thomas C Baghai1
2. J Damm2, MD
3. D Eser3, MD
4. C Schule4, MD
5. R Rupprecht5, MD

Epidemiological data show that the prevalence of depression in old age is high, is often underdiagnosed and undertreated, has a high rate of recurrence and is associated with significantly increased mortality. Because the prevalence of suicidal ideation is also relatively high in the old age, effective suicide prevention is especially needed for this age group. In addition, older patients experience more and longer major depressive episodes together with increased general medical comorbidities. Considerable comorbidity exists with dementia, stroke and Parkinson’s disease, where patients often suffer from depressive symptoms.

ECT has been shown excellent clinical effectiveness in geriatric patients. Despite specific side effects such as greater cognitive impairment, efficacy is greater in older than in younger patients. Recent improvements in the use of ECT include methods to maintain good therapeutic efficacy together with better tolerability concerning cognitive disturbances. Modified ECT techniques, including unilateral and bifrontal brief pulse wave stimulation and anesthesia with muscle relaxation substantially further enhance safety and tolerability. A reduced mortality in comparison to other treatments has been shown. Therefore to date on the long term no absolute medical contraindications to the use of modified ECT in geriatric patients, particularly in patients at specific medical risks. The chart analysis of more than 5000 electroconvulsive treatments confirms a good efficacy and tolerability especially in the group of older patients. Significant shorter treatment intervals until sufficient treatment response and remission could be observed especially in the group of patients older than 60 years. Efficacy, tolerability and safety data will be presented and discussed.

A key component of the Australian National Mental Health Plan is the development of a culture within mental health services where the use of information and benchmarking to improve the quality of service provision is the norm. To foster the development of this culture, a two-year National Mental Health Benchmarking Project was undertaken in Australian public sector mental health services across child and adolescent, adult, older persons and forensic services. This symposium will provide an overview of the project, examine the challenges of benchmarking services, the development of key performance indicators and the setting of benchmarks.

A special feature of the symposium will be an exploration of the variability across services in particular staff activity in child and adolescent services, 28 day readmission rates in adult services and length of stay in older persons services. Future developments in benchmarking Australian mental health services will be discussed.
BENCHMARKING MENTAL HEALTH SERVICES: THE AUSTRALIAN NATIONAL MENTAL HEALTH BENCHMARKING PROJECT, THE RESULTS AND LESSONS LEARNT

INSTITUTIONS
1. New South Wales Institute of Psychiatry, Australia
2. Barwon Health, Community and Mental Health, Australia
3. Bill Buckingham and Associates, Australia

AUTHORS
1. Tim Coombs¹, Mr, timcoombs1@bigpond.com
2. Tom Callaly², Dr, THOMAS@BarwonHealth.org.au
3. Bill Buckingham³, bill@buckingham.id.au

Aims/Objective: In Australia, a National Mental Health Plan¹ has seen significant investment to establish a culture within mental health services where the use of information for quality improvement and benchmarking is the norm. This paper will outline the information development agenda in Australia with particular reference to the establishment of benchmarking activities.

Method: Utilising a nationally agreed mental health performance framework that describes key aspects of organisational performance (effectiveness, appropriateness, efficiency, responsiveness, accessibility, safety, continuity, capability and sustainability) and thirteen agreed key performance indicators², the Australian National Mental Health Benchmarking Project brought together 23 mental health services across four program streams (Child and Adolescent, Adult, Older Persons and Forensics) to undertake collaborative benchmarking.

Result: Using the agreed indicators participants were able to compare organisational performance. Examples of variability across organisations will be presented, along with their implications.

Conclusions: Collaborative benchmarking to support quality improvement is possible within mental health services. However, benchmarking does require a commitment to the process and an investment of resources. In Australia, the National Mental Health Benchmarking project has provided the foundation upon which ongoing benchmarking activities can take place.

A BALANCING ACT: SELECTING A SET OF PERFORMANCE INDICATORS FOR AUSTRALIAN MENTAL HEALTH SERVICES.

INSTITUTIONS
1. Barwon Health, Community and Mental Health Service, Australia
2. Bill Buckingham and Associates, Australia
3. New South Wales Institute of Psychiatry, Australia

AUTHORS
1. Tom Callaly¹, Dr, THOMAS@BarwonHealth.org.au
2. Bill Buckingham², Mr, bill@buckingham.id.au
3. Tim Coombs³, Mr, timcoombs1@bigpond.com

Aims: To describe learnings from the Australian National Mental Health Benchmarking Project about performance indicators for mental health that meet the needs of policy makers, managers and service providers.

Methods: The group designing the first generation performance indicators for use in Australian services carefully considered the available literature. Subsequently, feedback was gathered from participants in a two-year collaborative benchmarking project involving 23 area mental health services, utilising the set of 13 performance indicators selected for trial.

Results: Measures of inputs, processes and the outcomes are all required for a full understanding of the performance of a mental health service. These need to cover the requirements of policy makers, managers and service providers, but also recognise that one approach may not meet all needs. While governments need to be informed about the workings of funded organisations, an effective and respected performance measurement system is one that is used for quality improvement and not punishment. Because information derived from the clinical interface is required, effort must be made to enlist clinician collaboration from the beginning, to include the perspectives of consumers and carers and to balance their varied interests. Organisations should begin with achievable measurement goals and let the process of benchmarking evolve as experience is gained and resources become available.

Conclusion: Building a National performance framework is costly. Indicators must be carefully chosen both to serve funders’ information needs and to assist organisations in performance measurement and quality improvement at a local level.
THE VALIDITY OF THE 28 DAY READMISSION RATE AS A PERFORMANCE INDICATOR IN MENTAL INSTITUTIONS

1. Barwon Health, Community and Mental Health, Australia
2. University of Melbourne, Department of Psychiatry, Australia
3. New South Wales Institute of Psychiatry, Australia

AUTHORS
1. Tom Callay, Dr, THOMAS@BarwonHealth.org.au
2. Mary Hyland, Mrs
3. Tom Trauer, Professor
4. Tim Coombs, Mr

Aims: To describe what has been learned from the Australian National Mental Health Benchmarking Project in relation to the 28 day readmission rate to acute adult inpatient services.

Methods: Across 8 acute adult units in Australia, we compared a variety of demographic, clinical and pre-admission variables of 222 patients who were readmitted within 28 days of discharge with 253 patients who were not readmitted within 28 days.

Results: 28 day readmission rates ranged between 4% and 16%. A history of recent admissions and poorer documentation in the index admission were the only consistent predictors of readmission across most or all units. Some factors, such as concomitant drug use in males and diagnosis of borderline personality disorder in females, were present in some units but not in others.

Conclusion: The high degree of variation in readmission rates between units makes generalisations about associations difficult. However, we did find that the strongest and most consistent association with 28-day readmissions rates was having at least one admission in the previous 12 months. This is consistent with a simple risk model: i.e. the more that a patient comes in and out of hospital, the more likely it is that one of those admissions will be less than 28 days after the previous discharge. Agencies need to look within their own organisational characteristics and models of care for factors helpful in reducing the 28 day readmission rate. In the light of these results, the value of this indicator is unclear.

CHILD ADOLESCENT MENTAL HEALTH SERVICES AND BENCHMARKING

1. Eastern Health, Child Adolescent Mental Health Service, Australia
2. Monash University, Department of Psychological Medicine, Australia

AUTHORS
1. Peter Brann, Dr, PhD, Peter.Brann@easternhealth.org.au
2. Leanne Beagley, Mrs
3. Sue Quartermain, Mrs

Aims/Objective
Like many health services, CAMHS is replete with dilemmas around the best use of limited resources. The Australian National Benchmarking Project helped six CAMHS compare performance across areas including efficiency, responsiveness, appropriateness and continuity contextualised with inclusion of funding and staffing data. While logistical issues occurred, these paled compared with the challenges to organisational culture. This presentation will focus on two aspects of benchmarking to illustrate this.

Method
Questions around comparative levels of efficiency led to examining staff activity between and within the CAMHS. Efficiency in itself is meaningless without considering appropriateness and effectiveness. This was examined through sampling all discharges for client severity, waiting times, diagnostic and problem profiles, and outcomes.

Result
Results of the activity survey were provocative for management, highlighting ambiguities in expectations while challenging clinicians and management to move past mutual defensiveness. The examination of discharges revealed differences seemingly connected to organisational philosophies and practices. While ostensibly sharing similar objectives, differences in approach to the tiers model and resulting differences in client characteristics and clinical practices was manifestly apparent.

Conclusion
While the quantitative emphasis has limitations, it is clear that without the benchmarking process and data, the richness of dialogue between these CAMHS would not have been possible. With benchmarking, organisational self-constructions were available for challenge and subsequent improvement. This presentation will address the implementation, analysis and emergent dialogue and actions. No CAMHS should underestimate the potential anxiety, excitement and layers of meaning involved in benchmarking.
RESULTS OF AUSTRALIAN OLDER PERSONS MENTAL HEALTH SERVICES PARTICIPATING IN NATIONAL BENCHMARKING FORUMS

INSTITUTIONS
1. Braeside Hospital, Mental Health Services for Older Persons, Australia

AUTHORS
1. Rod McKay1, Dr, RMCKA@doh.health.nsw.gov.au

Aims/Objectives: Seven older persons mental health services from five Australian states have now participated in a national benchmarking forum for over twelve months, utilising the national mental health key performance indicators (KPIs). The paper aims to describe results of this participation and demonstrate how KPI data was used to explore clinical practice.

Method: A review of documents utilised for the benchmarking forums was conducted, together with reflection upon the author’s experience of participation and discussion with other participants.

Result: Participating in benchmarking at a national level has allowed services to improve their understanding of the similarities and differences in service provision that exists. It has also allowed services to identify areas of key differences in performance, share intellectual resources, collaborate in generating projects to explore differences, and initiate local projects to improve practice. Data used to explore variation in length of stay between services, which became a major focus of the forums, will be presented. Whilst having some limitations, the national KPI set and data from routine outcome measurement collections have been valuable tools to assist these processes.

Conclusion: Benchmarking can assist mental health services for older people to improve their understanding of differences in practice and performance; and to generate local actions based upon these. KPI sets and routine outcome measurement assist these processes.

RESEARCH DISSEMINATION: COLLABORATING WITH THE WPA PUBLICATIONS PROGRAM

INSTITUTIONS
1. University of Melbourne, Psychiatry, Melbourne, Australia
2. World Psychiatric Association, Secretary for Publications, Geneva, Switzerland

AUTHORS
1. Helen Herrman, Prof, h.herrman@unimelb.edu.au

The WPA publications program has two main goals. The first is to disseminate information on significant clinical, service and research developments, reaching as many psychiatrists as possible worldwide. The second is to encourage contributions from psychiatrists of all regions of the world, in the form of research papers, commentaries or reports on mental health or significant service innovations. These goals are being pursued in several ways: through World Psychiatry; through several series of books; in joint activities with the WPA educational programme; and in collaborative activities with other organizations. Collaborative activities are essential to improve the timely and effective dissemination of research results. Research dissemination is essential for high standards and innovation in research and clinical services. The publications program in cooperation with the WPA and Member Societies has begun work to establish a database of indexed and non-indexed journals related to mental health and psychiatry in all regions. The program is studying the feasibility of collaborative work with interested Member Societies in LAMIC in support of the national mental health journal or journal of psychiatry.

MENTAL HEALTH SERVICES AND RESEARCH IN THE ARAB WORLD: THE NEED FOR SUPPORT

INSTITUTIONS
1. Ain Shams University, Psychiatry, Cairo, Egypt

AUTHORS
1. Tarek Okasha, Prof, tokasha@internetegypt.com

Although there are 22 Arab countries in the Arab League, the mental health services provided in those countries show several forms of variation. Economic, political, social and cultural factors seem to play a major role in determining the state of the psychiatric profession and the access of the service to citizens. The different needs expressed by the Arab colleagues at times seem incompatible with the available allocated resources. Some Arab countries enjoy the highest income per capita, yet this is inconsistent with the quality of mental health services available there. The per capita mental health services, the availability of a mental health act, and the space allocated for mental health in medical curricula are but a few of the concerns that have been expressed by colleagues from different countries of the Arab region. Another major concern is scientific research, publications and journals within the Arab world and within the African continent.

Currently, there are only a few journals available within the Arab world and the African continent, with very good research, but unfortunately, the international psychiatric community is unaware of these publications as these journals are not available on PubMed and other search engines.

This presentation will try to draw up a profile of the situation for mental health services and research in the region, and to suggest some measures of intervention focusing on publications and journal recognition in the international literature.
RESEARCH IN PSYCHIATRY: CHINA EXPERIENCE

INSTITUTIONS
1. Peking University, Psychiatry, Beijing Huilongguan Hospital, Beijing, China

AUTHORS

There has been rich experience of treating mental disorders by Traditional Chinese Medicine for more than 2500 years. Modern psychiatry was established in 1930’s, developed in 50’s, stopped and back in 60-70’s, restored in 80’s, accelerated in 1990’s and quickly promoted in 2000’s. The MOH convened a group of experts and developed the National Mental Health Project of China (2002-2010). The three main areas of focus are integrated care & multisectoral links, equity, community care; training of mental health professionals, increasing research; and development of mental health legislation. Psychiatry research was developed and expanded last 3 decades covering most of the fields of common interest: classification and evaluation, clinical pharmacology, neuro-psychology, neuro-image, neuro-physiology, neuro-biology, non-drug therapy and epidemiology on common mental disorders, suicide, forensic, geriatrics, substance abuse and child-adolescent disorders. National sponsored research projects on depression, schizophrenia, neurosis, crisis and stress disorders, and child and adolescent mental disorders are coming. Research in psychiatry is still relatively slow and small in China, multi-centers and international cooperation is highly recommended. Research dissemination is followed the publication of Chinese Journal of Psychiatry. The English version of Chinese psychiatry online (2001) could help to understand developing psychiatry in China.

DISSEMINATION OF MENTAL HEALTH RESEARCH IN LAMIC: A SURVEY AND CASE STUDY

INSTITUTIONS
1. Universidade Federal do Rio Grande do Sul, Psychiatry, Porto Alegre, Brazil

Low- and middle- income countries (LAMIC), where over 80% of the global population live, bear the greatest burden of mental disorders. The level of submission from LAMIC in high-impact indexed journals is however less than 20%, and the proportion of papers published is even lower - a search in the ISI Web of Science database from 1992 to 2001 reported that LAMIC (n=152) contributed only 6% of the international mental health research. Therefore, there is a marked underrepresentation of low- and middle- income countries (LAMIC) in the psychiatric literature, which may reflect an overall low representation of LAMIC publications in databases of indexed journals. A survey in both Medline and ISI/Web of Science was performed in order to identify journals in the field of Psychiatry according to their country of origin. Two hundred and twenty-two indexed psychiatric journals were found. Of these, 213 originated from high-income countries and only nine (4.1%) from middle-income countries. None were found in low-income countries. We also present the experience of a LAMIC psychiatric journal, the Revista Brasileira de Psiquiatria (RBP), in its recent indexation process. This case study serves as an example for other LAMIC journals to pursue indexation in major databases as a strategy to widen the international foundation of psychiatric research. There is an important need for the inclusion of LAMIC psychiatric publications in the major indexation databases. This process will require multiple agents to partner with journals from LAMIC to improve their quality and strengthen their chances of being indexed.
Catatonia has received increased attention over the past two decades. This workshop aims to review recent developments in catatonia research regarding progress in terms of clinical phenotypes, outcome and neurobiology as well as clinical practice. Catatonic, behavioural, and first-rank symptoms are analyzed concerning their heuristic value and a clustering of clinical features (Stompe, Austria; Caroff, USA). A cohort of patients with motility psychosis, a catatonic subtype with phasic course, was followed up in a 10-year study (Pfuhlmann, Germany). In periodic catatonia the major gene locus has already been localized to chromosome 15q15 in two independent genome scans (Stöber, Germany). Rating patterns and therapeutic aspects of catatonic psychoses further support the view of distinct phenotypes (Caroff, USA; Ungvari, Hong Kong, China).

Catatonia: Epidemiology of Catatonic Subtypes in European Samples

Institutions
1. Psychiatric University Clinic Vienna, Austria

Authors
1. Thomas Stompe

A century ago, Kraepelin and Bleuler reported a prevalence of catatonic schizophrenia about 20% to 30%. Especially since the 1970ies investigations described a significant decline of this subtype. Many reasons were suggested for this apparent or real decrease of catatonic schizophrenia. In this paper we introduce the results of our cross-sectional and longitudinal cultural comparative studies using a polydiagnostic approach (DSM-IV, Bleuler, Leonhard). The prevalence of catatonic subtype differed to a high extent, mainly dependent on the classification system applied. Possible reasons for this finding are discussed.
REGULAR SYMPOSIA

DIAGNOSIS AND TREATMENT OF CATATONIA: ONE AMERICAN PERSPECTIVE

INSTITUTIONS
1. University of Pennsylvania, VA Medical Center, Philadelphia, United States

AUTHORS
1. Stanley Caroff

Evidence from cultural sources indicates that disorders of posture and movement were historically recognized as signs of serious mental illness. This association was confirmed by Kahlbaum and other clinicians in the 19th century and incorporated in the concept of the catatonic syndrome. Subsequently, the concept of catatonia diverged, with American psychiatry adopting the notion of catatonia as a subtype of schizophrenia in keeping with the perceived views of Kraepelin and Bleuler. During the 20th century, the diagnosis of catatonic schizophrenia declined significantly accompanied by diminished awareness of catatonic phenomenology. However, the descriptive psychopathology and nosology of catatonia may be important when predicting response to treatment. As an example, studies of ECT in relation to catatonia will be reviewed in this presentation. ECT has shown a response rate of 70-100% in acute, hypokinetically catatonic but has rarely been studied systematically in other forms of catatonia. Psychomotor abnormalities, including catatonia, may predict a positive response to ECT in depressed and manic states, but early promise in schizophrenia even with catatonic signs has not been replicated. Further investigations of treatment are warranted in all forms of catatonia, and clinical trials of ECT or pharmacologic agents should include standardized measures of catatonia in all subjects.

MOTILITY PSYCHOSES: 10-YEAR FOLLOW-UP STUDY OF PATIENTS WITH BIPOLAR DISORDER

INSTITUTIONS
1. University of Würzburg, Department of Psychiatry, Psychotherapy and Psychosomatics, Würzburg, Germany

AUTHORS
1. Bruno Pfuhlmann

3. Gerald Stöber

Motility psychosis characteristically displays a hyperkinesia or akinnesia affecting predominantly expressive and reactive motions independent of disturbances of emotion or thought. It represents a subform of the cycloid psychoses which are bipolar phasic psychoses with complete remission after each episode and absence of residual symptoms. To examine the diagnostic stability, course and outcome of cycloid psychoses and their subforms, a systematic follow-up study was carried out. All patients admitted to one regular ward of the psychiatric university clinic of Würzburg between April 1991 and March 1992, who suffered from a bipolar phasic psychosis (manic depressive illness or cycloid psychosis) and were born after 1945, were included in a follow-up study with a catamnestic examination after more than 10 years. Diagnoses were established according to the criteria of Leonhard’s differentiated psychopathology. The rater at follow-up was blind against the initial diagnosis and established his diagnosis based on a detailed personal psychiatric exploration which usually took place at the patients’ homes. BPRS, PANSS, Strauss-Carpenter Outcome Scale and GAF were used to assess psychopathology, outcome and social and occupational functioning. Data about diagnostic stability, course and outcome of motility psychoses will be presented at the symposium.
GENETIC CORRELATES OF CATATONIA: PERIODIC CATATONIA AND CHROMOSOME 15Q15

INSTITUTIONS
1. University of Würzburg, Department of Psychiatry, Psychotherapy and Psychosomatics, Würzburg, Germany

AUTHORS
1. Gerald Stöber

The clinical significance of catatonic features is obvious and compelling. In catatonia a fundamental point is to discriminate quantitative hyperkinetic or akinetic changes, which are characteristic of the prognostically favourable motility psychosis, from qualitative changes, true "catatonic" signs. Hyperkinetic-akinetic motility psychosis is a phasic bipolar disorder with psychomotor excitation of expressive and reactive movements and/or akinesia pole with motor inhibition, particularly of involuntary movements. The central syndrome in periodic catatonia consists of qualitative psychomotor disturbances in both, a hyperkinetic and akinetic pole. Psychomotor excitement gives way to iterations and stereotypes, grimacing and parakinesia. On the other pole, prominent symptoms are akinetic negativism as well as distorted stiff movements, mask-like faces or posture stereotypes. In remission there remains a distinct mild to severe catatonic residual state with psychomotor weakness of facial expression and diminished incentive.

Periodic catatonia (MIM 605419) is familial schizophrenia phenotype reflected by a morbidity risk of ~27% for first degree relatives. The disorder is genetically mapped to chromosome 15q15 in two independent genome-wide linkage scans on a total sample of 16 multiplex pedigrees. We are completing a systematic mutation scan of candidate genes annotated in that region for fine mapping and identification of causative genetic variants. Thus, the findings on clinical phenotypes of catatonia speak in favour of a nosological classification of catatonia. As a general conjecture in the endogenous psychoses, clinical differentiation creates nosology, and these biological foundations will forge ahead insights in the aetiology.

MALIGNANT CATATONIA

INSTITUTIONS
1. University of Louisville, Department of Psychiatry & Behavioral Sciences, Louisville, KY, United States

AUTHORS
1. S.C. Mann

Aims: Malignant catatonia represents a life-threatening neuropsychiatric illness characterized by hyperthermia, catatonic stupor or excitement, altered consciousness and autonomic dysfunction. This disorder was the subject of numerous publications worldwide throughout the pre-antipsychotic drug era. Although the incidence of malignant catatonia appears to have declined following the introduction of modern psychopharmacologic agents, it continues to occur. We undertook a comprehensive review of the world literature in order to clarify the contemporary status of malignant catatonia.

Methods: Using Medline, the Science Citation Index, and the bibliographies of retrieved articles, we identified a series of 369 malignant catatonia cases reported since 1960.

Results: In 49 (13%) of the 369 cases, a preexisting neuromedical illness initiated the full syndromal picture. Infectious causes predominated. Of the 369 cases, 320 (87%) were viewed as an outgrowth of a major psychotic disorder. Fifty percent of the 369 cases ended in death. Sixty-seven percent exhibited the classic "excited" malignant catatonia described in the pre-antipsychotic drug literature. However, 33% had a primarily stuporous presentation which was often difficult to distinguish from neuroleptic malignant syndrome.

Conclusions: Malignant catatonia continues to occur and represents a nonspecific syndrome that develops as an outgrowth of neuromedical illness as well as the major psychoses. From this perspective, neuroleptic malignant syndrome, a potentially fatal complication of antipsychotic drug treatment, may be viewed as a drug-induced form of malignant catatonia. Furthermore, our findings suggest that simple catatonia, malignant catatonia, and neuroleptic malignant syndrome share a common pathophysiology involving reduced dopaminergic neurotransmission within the basal ganglia-thalamocortical circuits.
One of the most perplexing features of psychiatric and psychotherapeutic practice is the fact that patients repeat, over and over, behaviors which are not only contrary to their own best interest but also to their very own stated preference. This symposium offers existential or Daseinsanalytic perspectives, first, on repetition as a human phenomenon; second, on addiction, one of repetition's most nettlesome manifestations, and, third possibilities for humane and efficacious psychotherapeutic treatment.

REPETITION - PSYCHOPATHOLOGY OR A WAY OF BEING? A DASEINSANALYTIC VIEW

A major contribution of existential thinkers to the fields of clinical and analytic psychology and psychiatry has been the recognition that many of the so-called pathological conditions have an existential or ontological basis. The proposed paper continues in this tradition of comprehending such confounding human experiences by distinguishing the existential/ontological from the pathological. The experience to be thus examined is the famous "repetition compulsion," a phenomenon tragically familiar to any experienced practicing psychotherapist.

Surely, one of the most uncanny and unsettling aspects of the human odyssey is that individuals find themselves, in both work and love, cast ever again into eerily similar circumstances. In psychology, it was the founder of psychoanalysis, Sigmund Freud, who first identified and named this phenomenon. He called it the repetition compulsion, a term that has become nearly as integral to the practice of psychoanalysis as the term transference. Indeed, transferences are prime examples of such so-called neurotic repetitions. But is such repetition always lived out as compulsive or neurotic?

This paper presents a view of repetition as a fundamental characteristic of human existence which, in its psychopathological expression (as compulsion) embraces a number of crucial existential functions: Reiteration, reparation, and regeneration. The author will distinguish both existential and pathological forms of repetition and point to possibilities for addressing these issues in the psychotherapeutic relationship and situation.
AN EXISTENTIAL PSYCHODYNAMIC UNDERSTANDING OF ADDICTION AND ITS PSYCHOTHERAPY

INSTITUTIONS
1. Private practice, Zürich, Switzerland

AUTHORS
1. Perikles Kastrinidis¹, Dr., MD, pkastrinidis@hin.ch

In this paper the author presents a hermeneutic understanding of the dependence phenomenon addressing not only substance addictions to alcohol and drugs but also process addictions such as gambling and internet-related activities.

Relatedness, attachment, and bondage are essential aspects of the human condition. So are the human being’s basic needs for security and control to actually be capable of dealing with the finiteness of human existence, the fundamental limitedness of our being in the world. Persons suffering from addictive behavior, including the dangers of abuse and masochistic impairments, seem to be powerfully attracted by bondage on one hand. On the other hand they seem to lack security and control when facing human limitedness showing itself for example threatening or painful.

Today moreover, addiction is not only an individual health issue but also a phenomenon of the Zeitgeist. Therefore, the following questions will be raised: „What existential or essential human conditions might be hiding beneath or behind the overt and concrete, almost ubiquitously recognizable dependence-phenomena?” „What kind of relation is there between the ideals of contemporary societies and the fact that dependencies of very different kinds seem to have developed enormously during the last few decades?”

In dealing with these questions the author reflects on psychoanalytic, psychodynamic, and existential perspectives attempting to bring together a fresh, synthetic, phenomenological hermeneutic grasp of these troubling but important clinical and human matters.

AN EXISTENTIAL REFLECTION ON HOPE AND DESPAIR

INSTITUTIONS
1. Private Practice in Psychiatry and Psychotherapy, Oslo, Norway

AUTHORS
1. Einar Johnsen¹, MD

Although for many years theologians and philosophers have been interested in the phenomenon of hope, only recently has the phenomenon come to the attention of psychologists and psychiatrists. In Hebrew can mean „rope”, something to hold onto, to connect past experience with future expectations, to open up possibilities, to bridge a current undesired circumstance with future improvement. Thus hope may be used as both a noun, something to have, and a verb, an act of actively embracing the possibility of significant change. Hope is also a way of living and being.

Of special concern to psychiatry is that hope may or may not become present during suffering. When hope is present, it makes suffering more tolerable; pointing as it does to the possibility of relief from pain and discouragement. On the other hand, the absence of hope can be described as despair, a mood often seen in melancholic patients for whom this absence is absolute and made even more acute through the melancholic’s distinctive experience of time as utterly lacking a future.

Making the circumstance even more dire is that the melancholic person’s repetitious obsession with achievement, control, and adaptation to the “norm,” leaves little room for the possibility of hope.

In this paper, the author will take up an existential analysis of these issues, leading to the understanding of despair as imprisoning the self and hope as liberating it. Therefore, existentially speaking, whereas despair represents a closing of existence, hope may be understood as an opening.
Despite differences in research methods and time-window, there is a common pattern in the developed societies towards an elevate use of psychotropic medications in the general population. At the present time, there is growing concern about the role of psychiatric drugs in traffic accidents. It has been estimated that the cost of traffic accidents in Europe attributable to impairment from medications is 6.3 billion Euros each year. The validity of much research which has been conducted could be questioned, given that it has either used normal rather than clinical populations or has been confounded by indication. Furthermore, the concurrent use of multiple psychoactive medications in a single patient, i.e. polypharmacy, is increasingly common and debatable contemporary practice in clinical psychiatry that is necessary to consider. In view of these changes in prescription patterns, it is necessary to review the effect of the current psychiatric drug treatments on psychomotor functions and on driving performance. This review will be the main purpose of this symposium.

Both psychiatric disorders and psychiatric drug treatments can produce changes of perception, of information processing and integration, and of psychomotor activity which can disturb and/or interfere with the ability to drive safely. This study assesses the fitness to drive of a sample of psychiatric outpatients, with driver’s license and driving assiduously, using the accredited INDETER 100 battery, an electronic assessment unit measurement, in different clinical situations. Out of 120 patients, only 24 got scores compatible with the requirements of driving license, and 80% failed in at least one of the required tests. None of the patients studied notified the traffic authorities they had a psychiatric condition that may affect safe driving. No patient stopped driving, although 10% of them recognized that their ability to drive was somehow damaged. The law on fitness to drive remains vague in most European countries. It is the license holders’ legal responsibility to notify the authorities if they have a medical condition that may affect safe driving; failure to do so and giving false information constitute an offence. There are, in addition, insurance implications.
PSYCHIATRIC DRUGS AND ABILITY TO DRIVE

INSTITUTIONS
1. University of La Laguna, Psychiatry, La Laguna, Tenerife, Canary Islands, Spain
2. University of La Laguna, Pharmacology, La Laguna, Tenerife, Islas Canaria, Spain

AUTHORS

2. Carlos DE LAS CUEVAS\(^1\), Dr., MD PhD, cdelascuevas@gmail.com

We assessed the behavioral toxicity of psychotropics in the current prescribing patterns in psychiatric practice. LND 100 battery assessed basic skills evaluating the following areas: concentrated attention and resistance to monotony, multiple discriminative reactions and their correctness, anticipation of speed, binomial coordination, and decision making process with tendency to risks assumption. Cognitive functioning and psychomotor performance of 200 consecutive psychiatric outpatients (40 males and 60% females, mean age 44.8±12.5 years, rank 18-72) treated in a Community Mental Health Centre in the Canary Islands (Spain) were assessed in different clinical situations. According to Clinical Global Impression Severity Scale, 58.5% of patients were normal, or borderline, mentally ill; 30% were moderately ill, and 11.5% markedly ill. The ICID-10 diagnoses included: 10% mental and behavioral disorders due to psychoactive substance abuse; 7.5% of schizophrenia, schizotypal and delusional disorders; 35% of mood (affective) disorders; 42.5% neurotic, stress-related and somatoform disorders and 5.5% personality disorders. The mean number of psychoactive drugs used was 1.6 ± 1.1 (range 1-5). The rate of polypyschopharmacy was 53.5%, with 41% of patients using two drugs, 8% using three, and 4.5% using four or more psychotropic drugs. 16% of patients were only under psychotherapy. Antidepressants were the most prescribed drugs (57.5%; snsris= 35.5%; ssris= 20%; tricyclics= 2%), followed by benzodiazepine tranquillizers (52%) and antipsychotics (27%; Atypical=18%; Conventional=9%). 10% of patients use anticonvulsants and 5% antiparkinsonians. More than a half of the patients (56.1%) have a driving license driving almost every day. Six percent of patients are professional drivers.

ASSESSING FITNESS TO DRIVE IN PSYCHIATRIC PATIENTS

INSTITUTIONS
1. University of La Laguna, Psychiatry, La Laguna, Tenerife, Canary Islands, Spain
2. University of La Laguna, Pharmacology, La Laguna, Tenerife, Canary Islands, Spain

AUTHORS
1. Carlos DE LAS CUEVAS\(^1\), Dr., MD PhD, cdelascuevas@gmail.com
2. Emilio J. SANZ\(^2\), Dr., MD PhD, ejsanz@mail.com

No single measurement used can best predict driving performance. Neuropsychological tests, simulators, or on-the-road tests can be used to assess cognitive function and driving performance. Nevertheless, when used to predict driving performance, a poor correlation exists between on- or off-road driving tests and neuropsychological tests. The variability in outcome among these studies can be accounted for by different experimental designs (on- vs. off-road testing), variable outcomes of interest, study size, heterogeneity of study groups, degree of premorbid functional impairment and the type of predictive test (on- or off-road, simulators, neuropsychological tests). In this symposium LNDETER-100 battery will be presented. This device is an electronic assessment unit measurement that consists of five tests, requiring 25 minutes for administration. The battery of tests tap into the competencies required from subjects fitness to drive and has been accredited according to the Directive 91/439/EEC of the European Union. All tasks are objective, fair and do not discriminate against subjects from any culture, with even the personality module is an attitude-based test. The complete LNDETER battery is screen based where all tasks are visually displayed for the candidate. Scoring is automatic, where the final results of evaluation are displayed on a screen eliminating error prone and lengthy procedures. The competencies under assessment consist of five tests evaluating the following areas of subject skill:
1) Concentrated Attention and Resistance to monotony;
2) Multiple Discriminative reactions and their correctness;
3) Anticipation of speed;
4) Binomial coordination; and
5) Decision Making Process and tendency to the transgression of norms (risk).

CONSIDERATIONS IN REVISING THE DIAGNOSTIC CATEGORIES AND CRITERIA FOR DEMENTIA

INSTITUTIONS
1. University of California, San Diego/VA Medical Center, Psychiatry and Neurosciences, San Diego, United States

AUTHORS
1. Dilip V Jeste1, Dr., MD, djeste@ucsd.edu

Considerable advances in the understanding and treatment of dementing disorders have occurred since the DSM-IV and ICD-10 were published. Accordingly, it is expected that the diagnostic categories as well as criteria for dementia and related neurocognitive disorders in the DSM-V and ICD-11 will be significantly different from those in previous versions of these classifications. An APA/WHO/NIH workshop on Dementia was held in 2006, and the DSM-V Workgroup on Dementia and Other Neurocognitive Disorders has been established. This presentation will discuss issues involved in the revision of criteria for dementia.

Different types of non-Alzheimer’s dementias need to be addressed with the same vigor as Alzheimer’s disease. Mild Cognitive Impairment (MCI), should receive serious consideration. There may be two related sets of diagnostic criteria for MCI and dementia: A clinical set (without need for technology), and a research set (with neuroimaging, biomarkers, genotyping). Studies of sensitivity and specificity will be needed for both. There will likely be specific categories for different neuropsychiatric syndromes such as psychosis, depression, and sleep disturbances associated with Alzheimer’s disease and non-Alzheimer’s dementias. There is a critical need to develop consistent, reliable tests for individual biomarkers; and correlate biomarkers with clinical parameters longitudinally.

DISORDER GROUPINGS IN DSM-V

INSTITUTIONS
1. University of New Mexico, Psychiatry, Albuquerque, United States

AUTHORS
1. Jan A Fawcett¹, Dr., MD, jfawcett@salud.unm.edu

While maintaining the basic goals of reliability and clinical utility, desirable goals for a new classification of mental disorders are to extend the validity of diagnostic categories and to simplify the categories used. To address these goals, a Study group has been formed by the DSM-V Task Force to evaluate the evidence for current and future groupings of mental disorders (referred to as diagnostic spectra). This session will provide an overview of the Study group's work to date, and, using the DSM-V Mood Disorders Work group as an example, clarify how this work might affect future diagnostic groupings.

Questions to be addressed include: Is there evidence to support broad, less parsed, categorical diagnoses differentiated by symptom dimensions? Can a new classification permit inclusion of replicated findings from genetics, neuroimaging, or other biologic or etiologic markers to increase the diagnostic validity and better predict treatment response? Could such a system be devised that would allow for broad clinical use, but at the same time prevent reification of categories pending future knowledge of the etiology of disorders?

STATUS REPORT OF THE DSM-V PSYCHOSIS WORK GROUP

INSTITUTIONS
1. Vanderbilt University, Psychiatry, Nashville, United States

AUTHORS
1. Stephan H Heckers¹, Dr., MD, stephan.heckers@vanderbilt.edu

Aims
The DSM-V psychosis Work group has been charged with reviewing the current classification of psychotic disorders and making recommendations for the next edition of DSM. Initial efforts have focused on identifying boundaries of the current DSM-IV-TR psychotic disorders, assessing their diagnostic reliability/validity, and evaluating suggestions for alternative classifications. This presentation will review current efforts and goals of the work group.

Methods
Reviews of the existing literature on clinical and neural based phenotypes of psychosis and a meta-analysis of the latent structure of psychosis are underway. A review of possible dimensions of psychosis aims to identify criteria that can complement a categorical approach for psychotic disorders.

Results
The current classification of schizophrenia and bipolar disorder ignores substantial overlap of their clinical and neural phenotypes. Emphasis on reality distortion has not allowed for sufficient attention to a volition and cognitive deficits as essential aspects of the schizophrenia construct. Specific pathologic dimensions may clarify the similarities and differences between the major classes of psychiatric illness.

Conclusion
The DSM-V psychosis work group will review existing data sets and conduct new analyses to support improvements to the current classification. Dimensional assessments may supplement providing case-specific information for clinical decisions (1). These pathologic dimensions may also be targets in future etiological studies and therapeutic discovery (2).

DEVELOPMENTAL CONSIDERATIONS AND DISRUPTIVE BEHAVIOR DISORDERS

INSTITUTIONS
1. King’s College London, Institute of Psychiatry, London, United Kingdom

AUTHORS
1. Eric Taylor¹, Dr., MB, e.taylor@iop.kcl.ac.uk

Longitudinal research over the last decade has emphasized that mental illnesses are usually preceded by diagnosable levels of disturbance in childhood and adolescence. Separate classifications for children and adults can therefore be misleading, e.g., if the diagnosis changes merely because the person ages. DSM-V development should clarify presentations at different ages - including prodromes and premorbid risk states of disorder.

Another task is to understand continuities/discontinuities, e.g., the pathways through which oppositional disorders can lead to anxiety states, or ADHD can lead to conduct disorders. Children can show rapidly fluctuating uncontrolled mood states: it is tempting to regard them as equivalent to bipolar disorder. Careful attention should be paid to whether they do indeed share an underlying liability.

Developmental concepts will be needed to convert cross-sectional taxa into coherent trajectories. Research is needed on whether some disorders are best conceived as the exaggeration of an age-normal stage (e.g., separation anxiety). The signs of many disorders are on a continuum with normality, so impairment is a necessary condition for caseness and also a function of societal context.

GENDER AND CROSS CULTURAL ISSUES IN DSM-V

INSTITUTIONS
1. Yale University, Psychiatry, New Haven, United States

AUTHORS
1. Kimberly Yonkers¹, Dr., MD, kimberly.yonkers@yale.edu

Diagnostic criteria should be crafted in a way that accommodates differences in Gender and cultural differences in the expression of illness. A DSM-V Task Force Study group on Gender and Culture is developing models to explore the possible impact of gender and culture to accurately operationalize disorders.

We begin by exploring whether Depression criteria represents the illness equally well across gender, race and culture. A number of clinical cohort studies find that women are more likely to endorse “atypical” or “reverse neurovegetative” symptoms although not all reports agree. The literature also suggests that women compared with men, and Latinos, Asians and possibly Africans, compared to non-Hispanic whites with major depressive disorder are more likely to endorse somatic symptoms than other components of the syndrome such as sadness and dysphoria. Such symptoms include fatigue, pains from different organ systems and other somatic manifestations. According to international studies, some African languages do not have a word for depression. Asians appear to emphasize an asthenia component over “sadness” while some Latinos experience depression as “angustia” (“anguish”) rather than anhedonia or sadness.

This presentation will outline issues and work to date addressing gender, ethnic and cultural differences in DSM-V.

Modern era psychiatric research has advanced our knowledge in various areas, such as pathophysiology of mental disorders and their treatment. However, research advances, their interpretations and applications are frequently complicated by various methodological obstacles. This symposium will review problems in research methodology in four areas: imaging in bipolar disorders, clinical advances of transcranial magnetic stimulation (TMS), psychiatric health services research, and sexual medicine. Thus the participants will be able to learn basic methodological concepts and issues in four areas of psychiatric research.

Numerous brain imaging techniques have been used to study patients with bipolar disorder. These include structural imaging using MRI, metabolic imaging using PET or SPECT, receptor imaging using a range of ligands, and functional imaging using fMRI. Methodological issues in the study of bipolar patients are many. These include the issue of what mood state to study, operational definitions of the mood states, the issue of medication status, use of control/comparison groups, and finally, what imaging technique will answer the scientific question. In this talk, the presenter will briefly review the available studies using fMRI in patients with bipolar disorder discussing the methodological issues that are inherent in each of them. Finally, the presenter will present data from an ongoing study conducted at Wayne State University Depression in patients with bipolar disorder report is often described as a “curtain” that descends and takes the vibrancy out of life. To examine the brain circuits involved in affective regulation in bipolar patients, we conducted the following experiment using a 4T functional MRI system using a BOLD sequence. Patients were shown standard pictures from the International Affective Picture System series while in the MRI scanner. Pictures were balanced for positive and negative valence across the scans. Patients with bipolar type 1 were studied while clinically depressed and again when remitted. Their medications were held constant between mood states. To date seven bipolar patients have completed both scans. In conclusion, the methodological differences between studies limits the ability to generalize conclusions.
METHODOLOGICAL OBSTACLES FOR TMS-RESEARCH IN PSYCHIATRY

Transcranial Magnetic Stimulation (TMS) has proven beneficial in two separate domains. Repetitive TMS (rTMS) has been shown to decrease depressive symptoms in some groups of treatment-resistant patients with major depressive disorder (MDD). Recent reports suggest some usefulness in decreasing voices in schizophrenia patients and craving in alcohol or cocaine-dependent individuals. The other domain where TMS has proven useful is examination of cortical excitability in the awake human. In addition to being a probe of the pathophysiology of illnesses, cortical excitability measures hold a promise as a predictor of medication usefulness. A number of methodological obstacles hinder TMS-based research. First issue is the development of the appropriate sham TMS stimulation. Solutions of this problem vacillate between inexpensive but not full proof blinding to extremely expensive but more solid blinding methods. The second major problem is the size of area stimulated. Given that stimulation occurs at a distance, TMS-manufacturers have not yet been able to focus the stimulation area to smaller cortical regions. A similar problem is the location of stimulation. Thus far only cortical regions can be stimulated. Targeting deeper structures is also not possible at this time.

Engineering solutions are beginning to be considered. Finally, location of cortical stimulation remains largely dependent on outer skull markings. A number of systems to allow the neuronavigation of cortical stimulation are available commercially, but remain relatively expensive and require imaging procedures thus increasing the cost of TMS studies.

METHODOLOGICAL ISSUES WITH HEALTH SERVICES RESEARCH

INSTITUTIONS
1. Wayne State University School of Medicine, Department of Psychiatry and Behavioral Neurosciences, Detroit, United States

AUTHORS
1. Cynthia L. Arfken1, Associate Professor, Ph.D., carfken@med.wayne.edu

The Health Services field poses special challenges to researchers. The first challenge is to identify the unit of analysis. Although the information may be collected at the clinician or patient level, the research question may demand analysis at the level of the interdisciplinary team, clinic, corporation or country. For these analyses, appropriate data reduction strategies or multi-level analysis must be used. A second challenge is to incorporate regulatory, financial arrangements and other environmental contextual variables into the analysis or interpretation of results. For example, apparent differences between clinics in offering medications may be due to different regulatory oversight. To address this challenge, a model with these environmental variables included is needed. A third challenge is the complexity of the organizations, especially as there may be closures and mergers during the course of the study, forcing changes in data collection. Closely related to this challenge, is the challenge of staff and administration turnover. The US publicly financed mental health service in particular has been plagued by high turnover, creating challenges in identifying collaborators and recruitment. It also means that policies and procedures at the level of the clinic may change during the course of the study. In total, these challenges may force a trade-off between high quality data collection and generalizability, especially for longitudinal studies. Interpreting health services research requires awareness of these methodological issues.
METHODOLOGICAL ISSUES IN HUMAN SEXUALITY RESEARCH

INSTITUTIONS
1. Wayne State University School of Medicine, Department of Psychiatry and Behavioral Neurosciences, Detroit, United States

AUTHORS
1. Richard Balon1, Professor, M.D., rbalon@wayne.edu

Research of human sexuality has expanded enormously during the last several years. However, our full understanding of human sexuality remains limited. One of the main reasons of our poor understanding is the vast number of methodological issues inherent to studies of human sexuality.

The first methodological issue is our poor understanding of physiology of sexual functioning. Related to this is the lack of correlation between peripheral and central nervous findings in many observations and studies - and the lack of correlation between physiological response and psychological experience, especially in some studies of female sexuality.

The second area of paramount importance is the host of issues related to the diagnoses of sexual dysfunctions. The diagnostic criteria are inconsistent, poorly defined, and their validity is questionable.

The third issue relates to the overabundance of various outcome measures, with many of them being unfocused, poorly defined, and not always correctly validated. We lack one or two superior and widely used scale to measure sexual functioning and its changes.

The fourth methodological issue related to human sexuality research is the lack of rigorous design in most of the non-pharmacological studies.

Further serious methodological issues hindering research in this area include the lack of explicitly defined research populations, and the stigma of research of human sexuality in the general population.

Mental disorder is closely related to suicidal behaviour with rates depending on the individual disorder. Recent studies suggest that most suicide victims had asked for professional help just before committing suicide and were either not diagnosed or the treatment they received was inappropriate or inadequate. Risk factors include male gender, previous suicide attempt(s), comorbid mental disorders, adverse life-situations, acute psycho-social stressors etc. Recently there was observed a change in national suicide rates reflecting the drop of rates in those countries that implemented better recognition and treatment strategies as well as an increase in the rate in those countries undergoing a socio-economical transitional phase. Specific social parameters like social support networks, religion etc., may promote, inhibit or modify suicidal behaviours. From a neurobiological point of view, low brain serotonin activity might play a key role in suicidal behavior which also tends to run in families. Psychopharmacological treatment is the only well established treatment, especially its most severe cases, and recent results suggest that successful (acute and long-term) antidepressant pharmacotherapy reduces suicide morbidity and mortality even in high-risk populations.
RECENT CHANGES IN NATIONAL SUICIDE RATES: THE ROLE OF ANTIDEPRESSANTS

INSTITUTIONS
1. Aristotle University of Thessaloniki, 3rd Department of Psychiatry, Thessaloniki, Greece

AUTHORS
1. Konstantinos N Fountoulakis1, Dr, kfount@med.auth.gr

During the last 15 years we witness a decline in suicidal rates especially in countries where these rates were high. A number of factors could be held as responsible for this favourable fact, like better overall diagnosis and treatment of major depression or minor mood and anxiety disorders of patients seeking help for psychological problems in general practice and psychiatric care, as well as better recognition of possible suicidal behaviour. However the only factor related strongly to this change in rates is the increasing general use of SSRIs in these countries. On the contrary, socio-economic and other stressful conditions do not seem to affect the rate; in many of these countries these factors (e.g. unemployment) seem to have gone worse during this time period. Antidepressant monotherapy (unprotected by mood stabilisers) might increase or induce suicidal thinking but not completed suicide in a small part of bipolar patients, and thus there is a warning by the FDA concerning the use of antidepressants in children and adolescents. However the subsequent significant reduction of the use of SSRIs in these age groups in several countries including the US and the Netherlands led to a dramatic increase in completed suicidal rates, thus disputing the true utility of this warning and further confirming the strong (if not unique) role of antidepressants in the lowering of morbidity and mortality because of suicidality.

CLINICAL FEATURES RELATED TO SUICIDALITY

INSTITUTIONS
1. Semmelweis Medical University, Department of Psychiatry and Psychotherapy, Budapest, Hungary

AUTHORS
1. Zoltan Rihmer1, Dr, rihmer.z@kronet.hu

Untreated current major Axis I disorder (major depressive episode: 56-87%, substance use disorders: 26-55%, schizophrenia: 6-13%) is the most powerful predictor of suicide. Follow-up studies clearly support the evident clinical observation that if patients with unipolar or bipolar mood disorder commit or attempt suicide, they do it mostly during the depressive episode (78-89%) and less frequently in dysphoric mania or mixed affective episode (11-20%) but very rarely during euphoric mania or euthymia. However, since the vast majority of psychiatric patients never commit or attempt suicide, special clinical characteristics of the illness as well as some familial and psycho-social factors should also play a contributory role in self-destructive behaviour.

The clinically explorable predictors for suicide in major mental disorders are: 1/ Family history of suicide in first degree relatives, 2/ Early onset of the illness, 3/ Prior suicide attempt(s), 4/ Present suicidal ideation/few reasons for living, 5/ Major depressive episode (particularly mixed/agitated depression, and depression with severe hopelessness), 6/ Bipolar II diagnosis, 7/ Cyclothymic or depressive temperament, 8/ Comorbid Axis I and Axis II diagnoses, 8/ Cigarette smoking, 9/ Adverse early life events, and, 10/ Isolation, living alone, 11/ Acute psycho-social stressors, including severe medical disorders.

The most powerful single predictor of suicide in psychiatric patients is prior suicide attempt. However, more than two thirds of suicide victims die by their first attempt. Several recent studies have demonstrated that successful pharmacological and non-pharmacological management of patients with major mental disorders substantially reduces the risk of both committed and attempted suicide.
THE RELATIONSHIP BETWEEN WORK-RELATED STRESSORS, MAJOR DEPRESSION AND SUICIDALITY

INSTITUTIONS
1. University Hillerød, Denmark

AUTHORS
1. Per Bech1, Dr, pebe@noh.regionh.dk

A systematic review on the relationship between work-related psychosocial factors and the development of clinical depression has shown that the relative risk estimates were approximately 2.0. Apart from work overload “low social support at work” seemed to increase the risk for future depression. This supports the original work by Frank on demoralization as well as the studies focusing on social support networks in decreasing the risk of suicide.

The general adaptation syndrome (GAS) developed by Selye is still the best model both when discussing PTSD and the work-related stress syndrome (demoralization) in relation to major depression and suicidality. The first phase (the alarm reaction) is best measured by the somatic factor on the Hamilton Anxiety Scale. The next phase (the stage of resistance) is the psychic anxiety factor. The third phase is the stage of exhaustion which includes the symptoms of major depression in which an “alienation process” is developing with decreasing well-being or quality of life: “is life worth living?”.

Approximately 60% of the persons treated in our Stress Clinic in Hillerød fulfill the criteria of major depression with a HAM-D score of 18 or more.

Antidepressants or “antidistressants” are drugs which reduce the score on HAM-D and should be used not for a specific disorder, but for this target dimension across problems or disorders. The item of suicide on the HAM-D should always be analysed individually, as the score on this item will be hidden when focusing on total score only.

FORENSIC TOXICOLOGY OF 16,937 SUICIDES IN SWEDEN 1995-2005 INDICATES THAT THE INCREASED USE OF ANTIDEPRESSANTS CAUSED THE DECREASE IN SUICIDE

INSTITUTIONS
1. Department of Clinical Neuroscience, Division of Psychiatry, Karolinska Institute, Karolinska University Hospital, Stockholm, Sweden

AUTHORS

4. Pär Sparén1
5. Johan Ahlner1

Background and aims: Accumulating evidence supports the hypothesis that antidepressant treatment prevents suicide. Most of this evidence consists of studies demonstrating decreases in suicide in parallel with increased use of antidepressants in different populations. Since ecological studies cannot establish causality, this individual-based study, analyzing temporal patterns in the toxicology of all suicides in Sweden 1992-2005, aimed at testing the hypothesis that the substantial decrease in suicide during the period was caused by the increased use of antidepressants.

Methods: During the eleven years, 16,937 suicides, and 33,426 controls (natural or accidental deaths) were investigated by toxicological screening. The annual numbers of detections of antidepressants, zolpidem, zopiclone, tramadol, and dextropropoxyphene were analysed in suicides and controls.

Results: The annual number of suicides decreased by 332 cases (18.6 %). The expected number of antidepressant positive suicides, as determined only by their increased use in controls, was 741. If the decrease in suicide was caused by antidepressants, the expected number of suicides with antidepressants in toxicology should be reduced with 332 cases i.e. 409. If the decrease in suicide was not caused by antidepressants the expected number of positive cases should be reduced by 18.6 %, i.e. 603. The observed number was 420, indicating causality. The other drugs were detected as expected if they had not caused the decrease in suicide.

Conclusion: This controlled individual-based naturalistic study indicates that the increased use of antidepressants was the cause of the decrease in suicide previously demonstrated in ecological studies. Definite conclusions cannot be drawn, however.
Mental health legislations codify and consolidate the fundamental principles, values, goals, objectives and mental health policy. Such legislation is essential to guarantee that the dignity of patients is preserved and that their fundamental rights are protected. There is no national mental health legislation in 25% of countries with nearly 31% of the world’s population, although countries with a federal system of governance may have state mental health laws. Of the countries in which there is mental health legislation, half have national laws that were passed after 1990.

Countries including Indonesia, Bangladesh, Thailand, Malaysia, Myanmar, still have Mental Health Act based on British Lunacy Act. Legislation should ensure the introduction of mental health into primary health care.

Mental health care law should have these basic principles, which includes:

- Respect for dignity, autonomy and liberty - In this confidentiality should be maintained and there has to be provision for involuntary admissions.
- Professionalization of mental health services - Internationally accepted medical standards should be adopted for better care and treatment.
- Protect fundamental rights.
- Non discriminatory - No discrimination on the basis of race, religion, caste and color.
- Least restrictive environment - There should be decreased institutional placement and increased community services.

EVALUATION OF MENTAL HEALTH LEGISLATION SCENARIO IN WESTERN AND CENTRAL ASIA

Institutions
1. Fatimah Jinnah Medical College & Sir Ganga Ram Hospital, Department of Psychiatry, Lahore, Pakistan

Authors
1. Haroon R Chaudhry

Mental health policy, programme or legislations are important tools for the overall development of mental health resources in western and central Asia. They act as a broad guideline and provide direction and impetus to the development of mental health care facilities in a country. The Mental Health Legislation Programme contributes to the effective and timely implementation of the Mental Capacity Act and the new mental health legislation by working in partnership with the NHS, local authorities, people that use services, carers and other stakeholders to share good practice and promote joint working.

Mental health policies are present in 59.5% of the countries in the world. More than 30% countries do not have a national mental health programme. About a quarter of the countries do not have a law related to the field of mental health. Though 91.7% of the countries in the European Region have mental health legislation, the same is present in only 57.1% of the countries of the Eastern Mediterranean Region.

Though the majority of countries have a law related to mental health, this law is often not comprehensive and does not adhere to the international legislation concerning human rights. Often mental health legislative issues are simply mentioned as part of a general health law or a law related to forensic medicine. Disability benefits, though present in many countries, are neither comprehensive in nature nor easily accessible and lack standardized assessment procedures.
MENTAL HEALTH LEGISLATION: SCENARIO IN SOUTH ASIA

INSTITUTIONS
1. C.S.M. Medical University (Earlier K.G. Medical University), Psychiatry, Lucknow, India

AUTHORS
1. Jitendra Kumar Trivedi

Mental health legislations codify and consolidate the fundamental principles, values, goals, objectives and mental health policy. Such legislation is essential to guarantee that the dignity of patients is preserved and that their fundamental rights are protected. In WHO Health Report (2001) it was reported that 67% of countries in South-east Asia have mental health legislation and rest 33% have no such law.

Countries including Indonesia, Bangladesh, Thailand, Malaysia, Myanmar, still have Mental Health Act based on British Lunacy Act. Legislation should ensure the introduction of mental health into primary health care. In South Asian countries like India and Bangladesh delivering mental health services through primary health services is the most viable strategy.

Mental health care law should have these basic principles, which includes:

- Respect for dignity, autonomy and liberty - In this confidentiality should be maintained and there has to be provision for involuntary admissions.
- Professionalization of mental health services - Internationally accepted medical standards should be adopted for better care and treatment.
- Protect fundamental rights.
- Non discriminatory - No discrimination on the basis of race, religion, caste and color.
- Least restrictive environment - There should decrease institutional placement and increase community services.

(Regional workshop on Mental health legislation, Galle, Sri Lanka, May, 2001)

South Asian countries need a modern mental health law that gives priority to protecting the rights of persons with mental disorders, promotes development of community-based care and improves access to mental health care.

MENTAL HEALTH LEGISLATION AND ETHICAL ISSUES IN EAST ASIA

INSTITUTIONS
1. Seinan-Gakuin University, Japan

AUTHORS
1. Naotaka Shinfuku

Mental health legislation does not guarantee human right of mental patients. However, it is the necessary first step to develop mental health services which are humanistic, scientific and evidence based. All member states of WPA East Asian Zone have mental health legislation at national and regional level. Japan enacted in 1900 "Incarceration Law for the Lunatics" to protect the society from mental patients. Since then, legislation for mental patient has been modified several times reflecting the attitude of the society toward mental patients. In Taiwan and Korea, the enactments of mental health legislation took place in the 1990's. Chinese psychiatrists have started the preparation of mental health law since 1990's. However, it has not yet been approved at national level. Beijing and Shanghai have passed the mental health laws in the early 2000’s. Mental health legislations are the mirrors of social attitudes toward mental patients in East Asia.

My presentation will cover, among others, the following aspects.
- Overview of mental health services in Asia
- Development of mental health legislation in East Asia.
- Forces to develop mental health legislation in East Asia.
- Characteristic feature of mental health legislation in East Asia.
- Recent laws in the fields of mental health
- Asian culture and mental health legislation
MENTAL HEALTH LEGISLATION - SCENARIO IN AUSTRALASIA.

AUTHORS
1. Edvard Hauff, Dr., MD,PhD, edvard.hauff@medisin.uio.no
2. Marianne Kastrup, Dr., MD, PhD, marianne.kastrup@rh.regionh.dk

There is an increasing awareness of the need for research on how migrant and refugee populations fare in the country of exile. Pertinent issues relate to:
- What are the factors of risk/buffers for mental disorders?
- Can we identify specific subgroups that are in need for special interventions?
- Do the groups get access to existing services and for which problems?

If we are to fulfil the needs of the migrant groups with respect to alleviating their mental health problems such questions deserve increased focus.

The symposium aims at highlighting recent research carried out in the Scandinavian region to answer these questions.
MENTAL HEALTH CHANGES IN TORTURED REFUGEES ADMITTED TO MULTIDISCIPLINARY TREATMENT

2. Erik L Mortensen2, Mr.

The aim of this study was to examine changes in symptoms of PTSD, depression, anxiety, and in health-related quality of life in traumatized refugees admitted to multidisciplinary treatment. The study group comprises 45 persons admitted to the Rehabilitation and Research Centre for Torture Victims (RCT) in 2001-2002. Data on background, trauma, present social situation, mental symptoms (Hopkins Symptom Checklist-25, Hamilton Depression Scale, Harvard Trauma Questionnaire), and on health-related quality of life (WHO Quality of life-Bref) were collected before treatment, after nine months, and 23 months. A decrease in mental symptoms was observed in the period between the first and second follow-up, i.e. between the ninth and 23rd month. These changes and factors associated with these changes are currently being analysed and will be discussed during the presentation.

A HEALTH PROMOTION CLASS AS A MENTAL HEALTH PROMOTION INTERVENTION AMONG NEW-COMING REFUGEES IN THE RECEPTION PROGRAMME

AUTHORS
1. Solveig Ekblad1, 2, Dr., PhD, Solveig.Ekblad@ki.se
2. Kristofer Zätterström3, Mr., Kristofer.Zatterstrom@Botkyrka.se

On the basis of a survey (March-December 2006) performed on aspects of patients regarding care and support processes for newly-arrived refugees in the project entitled “Psychiatric disabilities in a transcultural perspective”, an intervention is being undertaken during 2007 and 2008 by a health promotion class, a revision from a mental health promotion course at Harvard, USA (Mollica, Lavell, Tor and Hovelson, 2007) and experience from an earlier project at Fittja psychiatric outpatient clinic. This course is developed within the frame of the reception programme in the Botkyrka community, a southern suburb of the capital of Stockholm where many immigrants are living. The participants, mainly from Iraq, are studying Swedish language and has received permanent permission to stay in the community. The study is prospective, with a baseline study and follow up after the five weeks’ course. Self-rating instruments measuring criteria on PTSD, depression, and mental health promotion were used. Each group for five weeks’ course consists of 10–15 participants. The course endure for 2 hours a week and one of the hours is a walk in the area. There are five themes, one each week: introduction, stress, exercise, public health habits, how to talk to your doctor. The presentation will include experience and lessons learnt from the first performed groups during autumn 2007 and spring 2008.
MENTAL HEALTH OF VIETNAMESE REFUGEES AFTER 23 YEARS IN EXILE: A LONGITUDINAL STUDY

INSTITUTIONS
1. University of Oslo, Institute of Psychiatry, Oslo, Norway
2. University of Bergen, Centre for Child and Adolescent Mental Health, Bergen, Norway

AUTHORS
1. Edvard Hauff1, Dr., MD, PhD, edvard.hauff@medisin.uio.no
2. Aina Basilier Vaage2, Dr., MD, ainabv@broadpark.no

Aims and objectives: The present study is the first prospective longitudinal cohort study of Vietnamese refugees followed for more than 20 years. How is the refugees’ mental health after 23 years in exile? What were the changes since the time of arrival?

Methods: A community cohort of Vietnamese refugees resettled in Norway was studied in 1982 (T1), 1985 (T2) and again in 2005 (T3). In 2005, the 80 respondents, 57% of the surviving original cohort, completed a self-report questionnaire before a semi-structured interview. The mental health was measured by Symptom Check List-90-R.

Results: The SCL-90-R mean score GSI was reduced from 0.81 at T1 to 0.49 at T3 (p<0.001). Associated with a lower GSI score was having more than 10 Vietnamese friends (p=0.04), being presently occupied (p=0.01) and rating the present general health as good (p<0.001). At T1 26% (n=20) of the respondents at T3 were “cases” (GSI ≥ 1.00), 25% at T2 and 18% at T3 (n.s.).

Conclusion: The main finding is in line with cross-sectional studies of Vietnamese refugees, and other longitudinal studies with shorter follow-up time, showing improvement in mental health over time. This finding indicates a resilience in this refugee population, but a considerable subgroup also has mental health problems after 23 years in exile.

UTILIZATION OF PSYCHIATRIC SERVICES OVER TIME AMONG MIGRANTS AND REFUGEES

INSTITUTIONS
1. Rigshospitalet, Centre Transcultural Psychiatry, Copenhagen, Denmark

AUTHORS
1. Marianne Kastrup1, Dr., MD, PhD, marianne.kastrup@rh.regionh.dk

A nationwide register study was carried out comprising 50,877 persons aged 18-66, who were registered in 2003 in the Danish Psychiatric Register or the National Patient Register with a psychiatric ICD-10 diagnosis.

Of the population 87.1% were ethnic Danes, 7.8% migrants, 4.0% off-springs with one Danish born parent, 0.7% off-springs with both parents born outside Denmark and 0.3% foreign adoptees. Males comprised 49%, women 51% of the population.

The 5 ethnic groups had significant differences in utilization of care, diagnostic distribution and use of coercion.

Women had higher contact rates in all groups apart from migrants.

The contact rate among persons of Middle Eastern background was relatively low.

Patients with a non-Danish background were more frequently non-voluntarily admitted and had significantly more frequently contact with services due to a forensic measure.

Substance abuse was higher among men in all ethnic groups. Contacts due to schizophrenia were higher among non-Danish patients and highest among young off-spring males.

Self-mutilating behaviour was seen more frequently among female off-springs from non-Western countries than among migrant women from non-Western countries.

The population was traced for utilization of psychiatric services during the period 1995-2003. Results from this follow-up period with respect to burden of care among the different ethnic groups will be presented.

ETHICS LEGISLATION FOR PSYCHIATRY IN EASTERN EUROPE

INSTITUTIONS
1. Hellenic Centre for Mental Health and Research, Athens, Greece

AUTHORS
1. George Christodoulou

Symposium organized by the WPA Standing Committee on Ethics and the Psychiatric Association for Eastern Europe and the Balkans

The purpose of this Symposium is to present the existing legislation concerning psychiatric Ethics in representative countries of Eastern Europe and to underline the problems arising from either inadequate legislation or poor implementation of the existing legislation.

The overall conclusion is that, since Ethics is a protean concept, legislation should be periodically revised and its implementation should be regularly monitored. The Symposium will be open for discussion to the Presidents or representatives of the Psychiatric Association for Eastern Europe and the Balkans and to the members of the WPA Standing Committee on Ethics.

ETHICS LEGISLATION FOR PSYCHIATRY IN GREECE

Ethics legislation for Psychiatry in Greece is incorporated in the legislation that concerns Medicine as a whole.

It reflects concern for the provision of the best treatment possible, respect for the human dignity, human rights and fundamental freedoms of the patient and it encourages mental health promotion (paragraph 1). It further underlines the need for CME of the psychiatrist (paragraph 2) utilization of the less restrictive therapeutic interventions, obligation for a second opinion, if needed, and attention to the educational needs of the staff (paragraph 3).

Furthermore, the Law encourages therapeutic strategies in partnership with the patient (paragraph 4) facilitation of informed decisions (paragraph 5) respect for the autonomy of the patient (paragraph 6) treatment with the consent of the patient, unless human life is threatened (paragraph 8).

Additionally, the Law prohibits the psychiatrist to take advantage of his therapeutic relationship with the patient or to use or disseminate confidential information. Breach of confidentiality should only be allowed only when human life is in danger (paragraph 9).

In cases of psychiatric examination for non-therapeutic reasons, the patient should be fully informed (paragraph 10) and when the patient participates as a research subject, informed consent should be given (paragraph 11).

The Law prohibits the psychiatrist to use professional methods to impose changes in attitudes or behaviors related to political or social convictions (paragraph 12) and encourages the psychiatrist to protect the honor and dignity of patients exposed to the media (paragraph 13).

The Legislation for Medical ethics in Turkish Republic dates back to 1928, where the ethical aspect of general medical practice is regulated. Statutes of Medical Deontology was amended in 1960, where 46 items on the rules on the clinical practice of physicians and dentists, on the doctor - patient relationship, and on the relationship within the treatment team was stated (1). These rules and regulations were valid for the psychiatric community too until the amendment of The Rules of Professional Ethics in Psychiatry in June 2002 (2). The WPA Madrid Declaration (1996) was translated into Turkish and already was accepted as a key text for psychiatrists in 1997. The rules regulate the rights of the patients and physician-patient relations, relationships between colleagues, human rights, medical research and publishing ethics and the rules for the application and modification of the ethical rules. The practical needs and application procedures will be discussed through cases.

CURRENT ETHICAL PROBLEMS IN RUSSIAN PSYCHIATRY

INSTITUTIONS
1. Moscow Research Institute of Psychiatry, Russian Federation

AUTHORS
1. Valery N Krasnov

In the former Soviet Union there existed a well organized and regulated system of psychiatric care, built on territorial ground. One of the disadvantages of this system was its excessive centralization. But from ethical and legal point of view the still more serious disadvantage was the lack of special law on psychiatric care in Soviet psychiatry. In the 70-80s of the last century this system was found to be connected with misuse of psychiatry in political purposes. Political authorities imposed on psychiatrists the way of conducting forensic psychiatric expertise with persons who made anti-Soviet statements or had anti-Soviet publications. Some of these cases were made public and fairly criticized by the whole world. In 1991 the Soviet Union fell apart and several other countries were formed. Russia was the first country where the Law about psychiatric care was passed. In 1992 this Law was confirmed by the Parliament and took effect in January 1993. The law considerably widened patients’ rights and restricted the possibility of unlawful actions in the course of psychiatric treatment. In 1994 Russian Society of Psychiatrists accepted the Code of psychiatrists’ professional ethics. Russian Association of Psychiatrists cooperates with WPA and other international organizations and is quite open to discuss the rights of the mentally ill. At the same time the introduction of basic laws in psychiatry does not at all solve all problems which exist in scientific and practical psychiatry. The necessity of solving different questions at the level of biomedical ethics arises more and more often.

ETHICAL AND LEGAL GROUNDS OF INVOLUNTARY HOSPITALIZATION IN RUSSIA

INSTITUTIONS
1. Independent Psychiatric Association of Russia, Moscow, Russian Federation
2. Russian Research Center for Human Rights, Moscow, Russian Federation

AUTHORS
1. L. Vinogradova
2. Y. Savenko

Objective: to reveal factors providing effective ethical and legal mechanisms of correct involuntary hospitalization

Method and materials: analysis of data of involuntary hospitalization monitoring in Russia during 2003-2007 and of several concrete cases

Results: analysis of significant differences in rate of involuntary hospitalization in various regions and in several time intervals, its tendencies and several concrete cases has allowed to discover motives of unsatisfactory law enforcement, which are doctors' accommodation, corruption and - lately - security agencies' meddling. This state roots in absence of independent court and guarantees of Law enforcement and in total ignorance of ethics. Ethical commissions are created by the authorities and not independent. Ethical Code is concerned as excess in the conditions of exact wording in the law.

MENTAL HEALTH POLICY AND LEGISLATION IN SERBIA - TOWARDS DESTIGMATIZATION OF PATIENTS AND PSYCHIATRISTS

INSTITUTIONS
1. University of Belgrade, Institute of Mental Health, School of Medicine, Serbia and Montenegro

AUTHORS
1. Dusica Lecic-Tosevski

Care of mentally ill persons is not to be merely carried out through diagnostic means and treatment only (in compliance with the standards in easily-accessible services and in a less restrictive way) but it also demands the full affirmation and human rights protection, consequently preventing any type of discrimination. Serbia, together with the other countries of the region, has begun the reform of mental health care, as part of the Mental Health program of the Stability Pact for South-East Europe. The reform comprises a complex series of measures with the basic objective to improve the quality of mental health care, prevention of mental disorders and mental health promotion, but also to promote availability and equity, protection of human rights and destigmatization of the patients. The National strategy for development of mental health care has been approved by the Government. This strategy aims at promotion of the reform of the mental health care system, including the passing of an adequate and efficient law that would govern the mechanisms for protection of human rights of persons with mental disorder.

The draft of the Mental Health Act has also been prepared, after a debate with professionals and associations all over the country. It was reviewed by the international experts, and will, hopefully, be approved soon.

DELIVERY OF HEALTHCARE IN THE DEVELOPING WORLD (WITH A FOCUS ON INDIA)

INSTITUTIONS
1. Indiana University School of Medicine, Indianapolis, Indiana, United States
2. C.S.M. Medical University, U.P., Lucknow, U.P., India

AUTHORS
1. Vijoy K Varma¹, Professor, MD, vijoyv@comcast.net
2. Jitendra K Trivedi², Professor, MD

Psychiatric services in the developing countries in Asia, Africa and South America suffer from enormous manpower constraints. As opposed to the norm of 100-150 psychiatrists per million population in developed countries in Western Europe and North America, developing countries average 1 to 4 psychiatrists per million population. The manpower situation in allied non-medical disciplines is even more unfavourable.

However, contrary to the expectation, in spite of affluence and advantageous manpower situation, Western countries do not necessarily provide a more optimal level of care, particularly for severe mental disorders. The mental health services in a country like the U.S. are very variable, with large pockets being ill-served.

It is accordingly emphasized that, while paying attention to making progress, developing countries should uphold their advantages, and should heed own priorities and philosophy. They should not blindly follow the West, so as to avoid their mistakes. (There is compelling evidence, for example, that the outcome of severe mental illness is more favourable in developing countries.) We must not lose sight of our advantages - of indigenous psychosocial therapeutic approaches and the traditional social support and values and family ties, increasingly eroded in the developed world.

MENTAL HEALTH SERVICES FOR DEVELOPING COUNTRIES

INSTITUTIONS
1. C.S.M. Medical University, Psychiatry, Lucknow, India

AUTHORS

Developments in the 20th century have dramatically changed the concept of mental health care as a result of new knowledge about mental disorders and treatment choices and of prevention of mental disorders and promotion of mental health.

In India, the place of mental health care as a part of general health has significantly changed during the last 60 years. At the time of independence there was no organized mental health care. This has changed and mental health issues are actively seen as a part of public agenda in the various forms. There has been some focus on the mental health care and it has grown from being non-existent to having some presence; however, despite the progress in mental health care the needs of the population are largely unmet. The problem faced by the health services include persistent gaps in manpower and infrastructure, especially at the primary health care level, the sub-optimal functioning of primary care, a large number of hospitals lacking appropriate manpower, diagnostic or therapeutic services, coupled with poor utilization of services in the neediest areas and inadequate inter-sectoral linkages.

Past few decades have witnessed radical changes in the political, economical and social conditions. The growth in the mental health care has not been enough to meet the needs of the community. Our community programs need to be tuned to the changing times and need basic reforms. Necessary steps to meet the mental health care needs include training the undergraduates, physicians and the community.
MENTAL HEALTH LEGISLATION FOR DEVELOPING COUNTRIES

INSTITUTIONS
1. North India Psychiatric Centre, Ludhiana, Punjab, India

AUTHORS
1. Anirudh K Kala, Professor, MD, anirudhkala@gmail.com

Developing countries in South Asia have a very serious resource deficit. South Asia has 0.1 psychiatrists per 100,000 population, 0.3 psychiatric beds per 10 thousand population and 0.1 nurses per 100,000 population. Even these meager resources are unevenly distributed leaving vast tracts of land without any mental health facilities. Trained personnel and mental health infrastructures are required to implement mental health provisions. For example, in India for an involuntary admission to occur, both a psychiatrist and a psychiatric bed should occur together. Since there are only about 30,000 psychiatric beds for a billion people, this often leads to a situation where mental health law is un-implementable. The same situation exists in all the South Asian and most other developing countries. There is a need to make emergency involuntary admission up to 72 hours possible even in community and primary health settings. There can be various other improvisations which are in the context of available mental health and cultural resources. However, making provisions for short involuntary admission less stringent raises important human rights issues. These can be addressed by having monitoring tribunals primarily constituted by non-psychiatric personnel from legal and social spheres, which can be accessed in cases of perceived wrongful restrained after admission has occurred.

DEVELOPMENT OF TRAINED MANPOWER FOR DEVELOPING COUNTRIES

INSTITUTIONS
1. Medical College, Psychiatry, Trissur, India

AUTHORS
1. Roy A Kallivayalil, Professor, MD, roykallivayalil@dataone.in

Developing countries have unique challenges, especially with sizable populations requiring mental health services. The number of qualified psychiatrists is fewer than one per 100,000 population. The number of beds, mental health professionals and resource allocations are far too inadequate. South Asia region is a prototype for such developing nations. The countries in this region have limited resources. Sometimes mental health is not a priority area in many of these countries.

What are the prospects ahead for development of trained manpower in mental health for developing nations? Simple strategies can make a huge difference. Including Psychiatry as a teaching subject with examination for undergraduate (MBBS/ equivalent courses), imparting psychiatry training to primary care physicians, opening up more and more General Hospital Psychiatry units, involving NGOs in mental care and increasing the training facilities for mental health professionals, etc., will be highly worthwhile initiatives in South Asia and other developing countries. Training and involvement of non-medical personnel in the delivery of mental health services in the developing countries can also be a possible solution. (We have several examples from countries like India, where this has been implemented.) The SARRC Psychiatric Federation, the ASEAN Psychiatric Federation and similar groupings can play an important role in co-ordinating mental health movement in the developing world. We will also need more of institutes of excellence like NIMHANS, Bangalore, India. The Western model, oriented to the needs of each country can be helpful in this regard.
COMMUNITY CARE, PUBLIC AWARENESS AND PRIVATE PSYCHIATRY

INSTITUTIONS
1. PARIVARTAN, Centre for Mental Health, New Delhi, India

AUTHORS
1. Avdesh Sharma, Dr., MD

The hallmark of many developing societies is that the Community Cares. This fact had been evident in many studies on prognosis. The societal changes (urbanized, nuclearized societies with stressed, broken down families and marginalized individuals fighting inter and intrapersonal conflicts), along with over-medicalization of mental health issues have eroded the tolerance of deviance from the normal and shifted the focus from indigenous methods of coping within developing societies. It is only recently that the institutionalized, government-centric approaches are giving way to community care models through non-governmental organizations with the help of private psychiatry movement.

India, a country fast tracking from the Developing towards Developed World, like many other countries in the world is a society in transition. If we were to look at the total burden of mental illnesses and emotional problems, the existing numbers of psychiatrists (about 4000) would be woefully inadequate for a population of 1000 million in India. Yet, these are far better than many other developing countries.

The future health care delivery systems would need to look at partnerships (govt./non-govt., public/private, professional/lay counselors, psychiatrists/physicians, skilled/semi-skilled health workers, westerns/eastern approaches, modern/indigenous medication, etc.), innovations in cost-effective manner for local resource-specific awareness programmes for early intervention and appropriate treatment/rehabilitative measures to cater to the growing mental health (not only illness) needs of the societies like India in transition. We need to develop newer models for effective health care delivery system which are appropriate, cost-effective and culturally sensitive.

From times immemorial, cultures have addressed to what contributes to personality, mental health and illness. Increasing and emergent transcultural research in mental illness has brought to light differences across cultures in many illness variables. Cross-cultural psychiatric and anthropological research has drawn attention to the considerable differences across cultures in such things as the incidence, typology, manifestations and outcome of mental illnesses.

In addition to the role of culture in shaping illness, it may also influence mental health and personality. There are considerable differences in personality configurations across cultures. This has given rise to the ‘culture-and-personality’ research. Whereas the differences across cultures may relate to the pathogenic, pathoplastic and health-sustaining influences of cultures, the similarities may indicate the core nature of the illness, a matter of crucial importance to all health professionals.
ANCIENT CIVILIZATION CONCEPTS OF MENTAL HEALTH AND ILLNESS

INSTITUTIONS
1. Indiana University School of Medicine, Indianapolis, Indiana, United States

AUTHORS
1. Vijoy K Varma1, Professor, MD, vijoyv@comcast.net

Mental illness and health being so important, all cultures have addressed to what contributes to mental health and what causes illness. Earlier concepts have addressed to attributes of the personality that contribute to health, those that cause illness, and the balance between the two.

Melancholia and hysteria were described in Egypt and Sumeria as early as 2600 B.C. Indian Ayur-Veda was written about 1400 B.C. Humoral theories, in some form or other, have been with us since Hippocrates. Also, various cultures have alluded to the basic elements - earth, fire, water and air - as contributing to the personality, health and illness.

According to ancient Indian Vedic concepts, personality is composed of three elements, Satva (pure qualities), Rajas (pleasure-seeking propensities and emotions) and Tamas (animal-like behavioural tendencies leading to deterioration). A dis-equilibrium between the three leads to mental illness Unmada (severe mental disorder) and other illnesses. Tridosha (vayu, pitta, kaf, the three cardinal defects or aberrations, are the aetiological factors in mental illness.

Islam seems to have taken a more benevolent view of the mentally ill, considering them to be blessed or holy. The essence of Taoistic doctrine is wu wei, meaning thereby ‘non-action’, ‘non-doing’, ‘non-interference’, ‘not doing anything’ and ‘doing nothing.’ Buddhism seems to extol the importance of balance or taking the middle path.

The paper will present concepts and classification of mental illness, deriving from the major religious, ethnic and national groups. It is expected to add to the current status and controversies associated with it.

RELATIONSHIP BETWEEN ACUTE PSYCHOSIS AND SCHIZOPHRENIA: EVIDENCE FROM RESEARCH

INSTITUTIONS
1. Postgraduate Medical Institute, Chandigarh, India
2. Fortis Hospital, Delhi, India

AUTHORS
1. Savita Malhotra1, Professor, MD, PhD, dr.savita.malhotra@gmail.com
2. Sameer Malhotra2, Dr., MD, sameersankalp2003@yahoo.com

Research in the field of acute and transient psychotic disorders has established its diagnostic validity and proposes certain modifications in the criteria given in the ICD 10. There is also evidence to suggest a continuum of psychopathological subgroups within the broad rubric of psychosis, with gradations of affectivity and schizophrenicity and a lot of overlap which may differ to a certain extent in respects of course, genetics and response to treatment. By-and-large, such observations seem to be somewhat consistent with the hypotheses that a) there is a shared genotype for the propensity for psychosis; and b) that there is expression of liability along a continuum of psychotic disorders, depending upon the degree of liability and the exposure to various neurologically damaging factors. Such observations question the very reference point to study psychotic disorders that emerges from the dichotomous distinctive approach between schizophrenia and manic depressive psychoses. Studies on acute and transient psychosis provide a framework for refinements in the diagnosis of psychotic disorders that shall have a bearing on other overlapping concepts and boundaries including schizophrenia and affective disorders. The presentation shall address such issues, suggesting a need to revive ‘psychosis’ as the subject of study transcending the discrete diagnostic categories.
DOES DHAT SYNDROME CONVEY ANYTHING MEANINGFUL?

INSTITUTIONS
1. Sir Ganga Ram Hospital, New Delhi, India
2. Northumberland, Tyne and Wear NHS Trust, and Newcastle University, Newcastle Upon Tyne, United Kingdom

AUTHORS
1. Satish C Malik, Professor, MD, prof.scmalik@gmail.com
2. Niraj Ahuja, Dr., MD

First described in 1960 (Wig, 1960), Dhat syndrome is a common presentation in psychiatric clinics in Indian subcontinent and the rest of South East Asia. It was originally described in men, who ascribed their somatic symptoms to the worrying presence of white discharge in urine, based on their world-view of such loss of a "vital substance". The concept was later extended to include women presenting with leucorrhoea with somatisation. The syndrome is included in ICD-10 under Neurotic disorders (F48.8) as well as a culture-specific disorder in Annexure 2 of the ICD-DCR classification.

There are divergent views regarding whether Dhat syndrome represents a culture-bound syndrome or whether it is an "uncritical culture-blind importation of alien epistemologies … and consequent manufacture of dubious syndromes" constituting "cultural iatrogensis" (Jadhav, 2004). It has also been described as 'semen loss anxiety' and a culturally defined symptom of depression. Whatever else, the symptom of Dhat appears to be a culturally defined idiom of distress in a given patient.

The paper will discuss issues related to pathogenic vs. pathoplastic influences of culture, benefits of categorical vs. dimensional approaches to understanding such presentations, and naturalistic vs. personalistic methodologies of studying psychopathology. The paper will also attempt to bridge the divergent views regarding aetiogenesis and classification of this clinical syndrome, focusing on the relevance of this theorisation to a culturally-sensitive psychiatrist, practicing in any part of World.

CHALLENGING BEHAVIOUR - A SYMPTOM NOT A DIAGNOSIS

INSTITUTIONS
1. Royal College of Psychiatrists, President, London, United Kingdom

AUTHORS
1. Sheila Hollins, Professor, shollins@rcpsych.ac.uk

In different cultures, violence and vulnerability are managed in different ways, the least adaptive of these including the use of caged or netted beds in Eastern Europe, and the use of neuroleptic medication in more affluent countries. Other more humane approaches include creating supportive environments which include people in their home communities, supporting family and informal carers and providing a range of psychological therapies. The aim of the symposium will be to stimulate discussion about good practice, and to encourage future interdisciplinary research to identify the best ways of supporting individuals. There will be time for discussion and debate.
EXPERIENCES OF RESETTLING PEOPLE WITH CHALLENGING BEHAVIOUR FROM A LONG-STAY INSTITUTION IN THE UK

2. Royal College of Psychiatrists, President, London, United Kingdom

AUTHORS
1. Jane Hubert¹, MA Dip Anth (Oxon)
2. Sheila Hollins², Professor, FRCPsyCh FRCPCH

This study aimed to gain a greater understanding of the experiences and needs of 20 men with learning disabilities who had been living in a locked ward. Qualitative (ethnographic) methods were used including the researcher spending around 250 hours in participant observation with the individuals on the ward and all traceable families were interviewed. The analysis used grounded theory, and material was fed back into the resettlement process throughout. The men’s lives were emotionally, socially and physically deprived. Their individual, gender and social identities were not recognised, and their general health and mental healthcare needs were inadequately addressed. People who live in long-stay institutions, segregated from society, lose their individual and social identity, which complicates the presentation of mental health and behavioural problems, and raises important adult protection issues. The presentation will also describe further follow up work undertaken with this group following closure of the institution.

CHALLENGING BEHAVIOUR - A UNIFIED APPROACH

INSTITUTIONS
1. Royal College of Psychiatrists, Vice-President, London, United Kingdom

AUTHORS
1. Roger Banks¹, Dr, MB ChB FRCPsych, rbanks@rcpsych.ac.uk

This a presentation of the main themes of the report of a joint working group of the learning disability faculties of the British Psychological Society and the Royal College of Psychiatrists, in consultation with the Royal College of Speech and Language Therapists. The main focus is on adults who are vulnerable to restrictive interventions and abuse as a consequence of their limited capacity to make choices for themselves about where they live or work, and how they are supported. This report concerns standards of clinical practice in supporting people with learning disabilities who present behavioural challenges. It unites the clinical theory and practice of health professions that have specific models for the assessment and management of challenging behaviour. The fundamental unifying principle is to improve the quality of life for people whose behaviour challenges others.

Royal College of Psychiatrists. Challenging behaviour - a unified approach, College report CR144, 2007; London: RCPsych
IS THERE A ROLE FOR DRUG TREATMENT IN THE MANAGEMENT OF CHALLENGING BEHAVIOUR IN PEOPLE WITH INTELLECTUAL DISABILITY? A REPORT OF THE NACHBID STUDY

INSTITUTIONS
1. Imperial College, Department of Psychological Medicine, London, United Kingdom

AUTHORS
1. Peter Tyrer1, Professor

This presentation will present a critical review of the role of neuroleptic drug treatment for challenging behaviour in people with intellectual disability. Drug treatment is often used in aggressive challenging behaviour without an adequate evidence base. This study compared risperidone, haloperidol and placebo in a randomized control trial, the conclusions of which were that antipsychotic drugs should no longer be regarded as an acceptable routine treatment for aggressive challenging behaviour in people with intellectual disability. The implications for clinical practice will be discussed.

PSYCHOLOGICAL APPROACHES TO THE MANAGEMENT OF CHALLENGING BEHAVIOUR - EXPERIENCE FROM THE CZECH REPUBLIC

INSTITUTIONS
1. Charles University, Prague, Czech Republic

AUTHORS
1. Hynek Jun1, Dr, PhD

In my presentation I will speak about CBT therapy of aggression in institutions of social care in the Czech Republic. I will be presenting the ‘five steps’ therapeutic model for decreasing the occurrence of aggression; this has been developed from behavioural therapy and the Eden Decision Model (EDM- Holmes- Autism through the lifespan). The first step is a behavioural and functional analysis, the following steps are analysis of environment and tasks, reinforcement and punishment. I will speak about physical, mechanical and chemical restraint in the Czech Republic. I will endeavour also to show what is better in my view and to demonstrate good practice in the Czech Republic I will use a short film.
THE AUSTRALIAN EXPERIENCE OF SUSTAINABLE IMPLEMENTATION OF ROUTINE OUTCOME MEASUREMENT

INSTITUTIONS
1. The New South Wales Institute of Psychiatry, Sydney, Australia
2. University of Melbourne, Australia
3. University of Queensland, Australia
4. Data Systematics, Australia

AUTHORS
1. Tim Coombs
2. Jane Pirkis
3. Philip Burgess
4. Allen Morris-Yates

Objective: In Australia a suite of outcomes measures have been introduced into routine clinical practice across all age groups and service settings within public sector mental health services. These include clinician rated measures such as the Health of the Nation Outcomes Scales (HoNOS) and consumer self-assessment measures such as the Kessler 10. This paper will describe the process of implementation including the development of clinical information systems, flexible yet consistent approaches to training, exploration of the clinical utility of outcome measures and web based feedback aimed at engaging clinicians.

Method: Through the review of policy developments over the last 15 years, along with a description of approaches to training and implementation, and an analysis of submitted data, the national implementation challenges of routine outcome measurement will be explored.

Findings: Although there has been variability in implementation, some 15,000 staff have received training or been exposed to routine outcome measurement. The process of implementation provided significant opportunities for quality improvement activities. Initial analysis has revealed improvements in the presentation of consumers in contact with public sector mental health services.

Conclusion: In Australia the implementation of routine outcome measurement to public mental health services continues. Challenges to sustainability include the need for investment and leadership along with a commitment to the ongoing development of routine outcome measurement.

ROUTINE OUTCOME MEASUREMENT IN AUSTRALIAN CHILD AND ADOLESCENT MENTAL HEALTH SERVICES

INSTITUTIONS
1. Monash University, Department of Psychological Medicine, Melbourne, Australia

AUTHORS
1. Peter Brann

Aims/Objectives
This paper describes routine outcome measurement (ROM) across Australian child and adolescent mental health services (CAMHS). Examples will be provided of the benefits, dilemmas and issues emerging from this nationwide implementation.

Methods
By 2003, Australian CAMHS were involved in ROM with support from a National Outcomes Expert Group. The majority of examples will be drawn from a local service which commenced ROM in 1997. The ongoing use of HoNOSCA and the Strengths and Difficulties Questionnaire (SDQ) has created significant datasets, which, as a microcosm of the national datasets, have allowed a wide range of clinical and evaluation activities. With both instruments being used internationally, Australian CAMHS has been able to inform and be informed by other nations.

Results
Clinicians have used the data to inform case reviews and supervision. Individual client’s data have been able to be compared with national reference data. Aggregated data has assisted the service to redirect resources and modify its priorities. Evaluation and research has incorporated the measures into protocols enabling comparisons with other CAMHS populations.

However with increasing use, certain dilemmas and opportunities are becoming apparent. There is a need to develop a broader range of clinically relevant reports for use by clinicians, adolescents and parents. ROM benefits from incorporation into clinical processes but at some point raises questions about the utility of those practices. Increasingly important is the question of how to present and interpret change; different approaches will be described.

Conclusion
While not without difficulties, ROM has substantially influenced CAMHS in Australia.

ROUTINE OUTCOME MEASUREMENT IN ADULT MENTAL HEALTH SERVICES IN AUSTRALIA

INSTITUTIONS
1. University of Melbourne, Department of Psychiatry, Australia

AUTHORS
1. Tom Trauer

Aims/Objectives
To describe routine outcome measurement (ROM) as it relates to adult consumers (patients) in Australia, and to identify some of the current issues and challenges.

Methods
Information is drawn from official documents, published research and personal experience.

Results
ROM is based on a set of measures, assessing symptoms and disability (assessed by the clinician) and subjective problems (assessed by the consumer). Assessments are scheduled for collection in inpatient, community and residential settings at admission/intake, reviews, and discharge/closure. A large body of experience and data has been accumulated, and a wide variety of training and clinical resources have been developed. While Australia has been at the forefront of this work, there are several areas that are ongoing challenges. These include: variable rates of completion of the measures; not all staff are convinced of the purpose or value of ROM; the consumer self-rating measures are not completed as often as the clinician measures; there is little consensus on how change at the individual level should be evaluated; there is little guidance on how to use measures in combination, and little work has been done on ROM when applied to consumers with indigenous and ethnic backgrounds.

Conclusions
Australia leads the world in ROM implemented at the national level, and has developed a wealth of tools, experience and research. ROM is complex, and its implementation is evolutionary.
INTEGRATING ROUTINE OUTCOME MEASUREMENT INTO AGED CARE PSYCHIATRY

INSTITUTIONS
1. Braeside Hospital, Sydney, Australia

AUTHORS
1. Rod McKay
2. Regina McDonald

Aims/Objectives
To provide an overview of a model developed and implemented within an Aged Care Psychiatry service that has integrated aspects of the Australian National Outcomes and Casemix Collection (NOCC) into direct clinical practice and service management.

Methods
With the introduction of NOCC all Australian public mental health services are mandated to collect a set or routine outcome measures and a minimum data set. In order to make this initiative useful at a service level the concepts of evidence based care, clinical governance and routine outcome measurement were linked. This resulted in a review and redesign of clinical information use in the service; with particular emphasis on reviewing care planning and team case conference activities.

Results
All patients entering the service have the key focus for clinical care and improvement identified early in their community or inpatient admission. This is linked to a single scale of the Health of the Nation Outcome Scales 65+ version and referred to as the ‘key item’. This item is then used for monitoring of patient progress, care planning, and to improve team communication. Collated data is used to analyse service functioning and inform management.

Conclusion
Routine outcome measurement appears a valuable tool to improving mental health care when linked to local clinical practices.

INTRODUCING ROUTINE OUTCOME MEASURES - A CLINICAL DIRECTOR'S PERSPECTIVE

INSTITUTIONS
1. Barwon Health, Australia

AUTHORS
1. Tom Callaly

Aim:
To describe lessons learnt over ten years of establishing a system for introducing and using routine outcome measures in an Australian mental health service.

Findings:
For most organisations, the introduction of the use of outcome measures into routine clinical practice will necessitate reviewing and re-engineering their core business processes. Effective implementation will require the introduction of a clearly defined case management system; the development of a client record system that reflects that case management system and into which outcome measures can be embedded; and the creation or adoption of a computerised system which can be used to collect outcome measure ratings and display results and comparisons for clinicians. In addition, the views of clinicians and consumers will need to be recruited and they will need to be given a significant role if this ambitious undertaking is to work effectively.

Conclusion:
If routine outcome measures are introduced as an isolated activity without major changes to clinical and information systems, staff will not consistently collect them and important opportunities for service improvement will have been missed.
RS-36

CLINICAL FORENSIC ISSUES

INSTITUTIONS
1. Meerkanten GGZ, Harderwijk, The Netherlands

AUTHORS
1. Peter J. Verhagen¹, mr., MD, verhagen.p@wxs.nl

Clinical issues play an important role in forensic and correctional settings. In this symposium three topics are presented:
- the concept of conscience
- dimensional versus categorical diagnosis of psychiatric disorders in forensic psychiatry
- plasma level monitoring of antipsychotics in psychosis wards of forensic mental units.

This symposium will contribute to a better understanding of the topics covered and participants should be able to recognize the importance of these subjects.

FORENSIC PSYCHIATRY AND THE CONSCIENCE

INSTITUTIONS
1. University of Tilburg, Faculty of Law, Tilburg, The Netherlands

AUTHORS
1. Karel T.I. Oei¹, dr., MD, PhD, t.i.oei@uvt.nl

Is conscience a balancing function in the justification of one's own or someone else's actions?
This question is ventral to the present paper, in which I will present a limited overview of what the forensic psychiatrist meets in his work in terms of the concept conscience.
It seems that in the more recent past the primary legitimation for court-imposed punishment was retaliation, whilst in today's world greater attention is being paid to the victim. And the chance is high that in an era in which the individual is expected to carry more and more responsibility for his deeds and practices, the concept of 'conscience' will also gain in importance. First the concept will be outlined, as seen by the adult. Second, the concept of conscience will be illustrated, as is in the case of how a child would like to understand it. It is clear that in order for the human conscience to function properly, an individual has to be able to call on images from his own fantasies. Recognizing faces corresponds with a brain function and a neuro-anatomic substrate. There is a burden of conscience. There is also self determination and taking justice into one's own hands. In forensic psychiatry there are difficult situations, especially when a non-cooperative defendant is denying everything of a criminal act. For doctors and police makers there is a painful moment in situations of conflicts of duties.
DIMENSIONAL VERSUS CATEGORICAL DIAGNOSIS OF PSYCHIATRIC DISORDERS IN INCARCERATED BOYS

INSTITUTIONS
1. De Hartelborgt, Spijkenisse, The Netherlands
2. University of Tilburg, Faculty of Law, Tilburg, The Netherlands

AUTHORS
1. Ellemieke Nederlof¹, mrs., MD, nederlof50@hotmail.com
2. Karel Oei², dr., MD, PhD, t.i.oei@uvt.nl
3. Peter Dingemans¹, mr., MD

Several studies have shown that psychiatric disorders occur frequently among incarcerated boys; even up till 90% meet criteria of any psychiatric disorder. The most common are externalizing disorders and less often internalizing disorders. Comorbidity rate is high (67%). Conduct disorder (73%) and oppositional disorder (14%) are reported often, besides ADHD (8%) and substance use disorder (55%). Aim of the study is to determine dimensions which are underlying these psychiatric disorders, to make it possible to adjust treatment.

Method
Hundred boys who were incarcerated in the The Hartelborgt were supposed to be included. After informed consent the participants were administered a structured questionnaire regarding sociodemographics and treatment history, an intelligence test, the SCID I and II for DSM diagnosis, the DAPP-BQ and the BFI for dimensional diagnosis and the CTQ for trauma history investigation.

Research
DSM psychiatric disorders measured with the SCID I and II, will be compared with the dimensions, measured with dimensional questionnaires.

Results
The relation was analyzed between the 5 dimensions measured with the BFI and the 4 higher order dimensions and 18 traits measured by the DAPP-BQ and the 3 most common found (clusters of) psychiatric disorders: psychotic symptoms, substance use disorder and disruptive behavior.

Recommendations
It is recommended to use a combination of categorical diagnostic instruments and dimensional assessment to support treatment goals. For future research it is recommended to look for physiological or neuropsychological markers.

COURT-ORDER PATIENTS WITH PLASMA LEVEL MONITORING OF ANTIPSYCHOTICS

INSTITUTIONS
1. Pompestichting, Nijmegen, The Netherlands
2. University of Tilburg, Faculty of Law, Tilburg, The Netherlands

AUTHORS
1. Karel de Blecourt¹, dr., MD
2. Karel Oei², dr., MD, PhD, t.i.oei@uvt.nl

Purpose:
Investigate whether prescribed antipsychotic have yielded effective plasma levels.

Method:
In three groups of ten inpatients of a detention of hospital order clinic, plasma level monitoring was done in 15 probands with antipsychotics in average or high dose.

Results:
Ten probands displayed relatively low plasma levels.

One result is mentioned for each of the antipsychotics used (no interactions).
- zuclopentixol decanoas 1000 mg / 3 weeks 13 (10 - 50)
- risperidon consta 50 mg / 2 weeks 20 (10 - 95)
- quetiapin 1000 mg / day 57 (50 - 750)
- olanzapin 20 mg / day 13 (20 - 50)

Discussion:
Ten patients out of a 30 (one third) appeared to have relatively low plasma levels which might be indicative for ultra rapid metabolisation. From the general population only 1% is an ultra rapid metaboliser. Possible explanation is, that a number of patients in psychosis wards of Forensic Mental Units who previously have been treated in Mental Hospitals, might have had insufficient preventive profit during treatment on standard dose. This might have led to a selection bias. By adjustment of the dose, therapeutic effect could be improved. This means that therapeutic conversations could be more effective, if the patient concerned is biologically under control.

Conclusion:
This result, indicative for ultra rapid metabolisation, has to be confirmed pharmacogenetically. This way of treatment approach favours the doctor-patient relationship, all the same.

AUTHORS
1. Peter Handest¹, Dr., PhD, handest@dadlnet.dk
2. Josef Parnas², Dr., Prof., jpa@hum.ku.dk

Background
The notion of a non-psychotic form of schizophrenia appeared in parallel to the schizophrenia concept since the inception of the latter. Currently, the ICD-10 operates with schizotypal disorder classified as a mild form of schizophrenia, whereas in the DSM-IV it is viewed as a personality disorder.

Aims
To validate the clinical concept of schizotypal disorder the results of genetic and own empirical studies are presented.

Methods
Review of genetic studies and presentation of own psychopathological studies.

Results
Genetic studies have consistently shown that non-psychotic schizophrenia spectrum symptoms aggregate in relatives of schizophrenia patients. Our own studies have shown that basic symptoms and self-disorders occur equally often in schizophrenia and schizotypal disorder, and significantly higher than in non-spectrum patients. The schizotypal disorders' scores of the psychotic PANSS dimensions are lower than in schizophrenia but higher than in non-schizophrenia spectrum. The frequency of schizophrenia among the relatives of schizophrenia and schizotypal patients is elevated. 20% of first admitted schizotypal patients develop schizophrenia during the first 5 years.

Conclusion
These results lend jointly a substantial clinical validity to the concept of schizotypal disorder as a „milder” part of schizophrenia spectrum.
Background
Kraepelin introduced a distinction between manic-depressive psychosis and schizophrenia. The schizoaffective diagnosis emerged as an ultimate result of this distinction. The current operational classificatory systems (DSM-IV and ICD-10) have endeavoured to clear the schizophrenia diagnosis of all affective symptoms by the aid of exclusion criteria. Still, affective symptoms have always been seen as natural parts of schizophrenia (e.g. Bleuler’s “mania” and “depression” in schizophrenia).

Aims
To elucidate the occurrence and the character of depressive and depression-like symptoms in schizophrenia in order to facilitate differential diagnosis against the affective spectrum.

Methods
A qualitative exploration of psychopathological features based on literature and clinical examination.

Results
Initial depression is seen in up to 60% of first-episode schizophrenia cases, depression is frequent in the post-psychotic phase, and negative symptoms are often misinterpreted as depressive symptoms. The differential diagnosis is difficult. The course of the illness is of great diagnostic importance. Misdiagnosis in prodromal states is common, leading to delayed detection of impending psychosis. The subjective and expressive depressive symptoms must be examined qualitatively in the context of the underlying structure of affective or schizophrenic illness. A number of such qualitative differences are described.

Conclusion
A global qualitative examination of the symptoms in their context will lead to a more valid diagnosis.

SUBJECTIVE AND OBJECTIVE COGNITIVE FUNCTION IN THE EARLY AND LATE INITIAL PRODROMAL STATE

Background
Cognitive disturbances have been demonstrated in potentially prodromal subjects in both objective, i.e., neuropsychological, as well as subjective, i.e., psychopathological studies. Yet, the relation between subjective and objective cognitive deficits and to different prodromal states is unclear.

Aims
To explore interactions between subjective and objective cognitive measures in different prodromal states.

Methods
In subjects suffering from an early (EIPS; n=33) or late initial prodromal state (LIPS; n=69), subjective and objective cognitive deficits were assessed with the Schizophrenia Proneness Instrument and a comprehensive neuropsychological test battery.

Results
EIPS subjects were widely less impaired than LIPS subjects, though this was more pronounced in psychopathology. Subjective and objective cognitive deficits were unrelated, except for significant correlations between time-limited neurocognitive speed measures and subjectively reduced stress tolerance, especially in EIPS subjects.

Conclusion
Subjective and objective cognitive deficits are generally unrelated in the psychosis prodrome, thereby carrying the potential to add valuable complementary information for prediction. However, possible associations between the two levels might be better detectable in the less impaired EIPS.
THE STRUCTURE OF SELF-DISORDERS IN SCHIZOPHRENIA

INSTITUTIONS
1. Hvidovre Psychiatric Center and The National Danish Research Foundation: Center for Subjectivity Research, University of Copenhagen, Denmark

AUTHORS
1. Josef Parnas, Dr., Prof., jpa@hum.ku.dk

Background
Disorders of self-experience were already described in the classic psychiatric literature as central subjective phenomena of the schizophrenia spectrum disorders. They were recently “rediscovered” in European psychopathological empirical studies.

Aim
To perform a phenomenological analysis of the experiential hierarchy of experiential self-disorders.

Methods
A qualitative investigation of empirical data from 50 first-admitted patients.

Results and conclusions
It is proposed that the most basic feature consists of instability in the perspectival articulation of awareness, giving rise to the disorders of ownership (mine-ness), sense of identity/unity, and sense of boundedness (ego-boundaries).

PRODROMAL INSIGHT, SUBJECTIVE PSYCHOPATHOLOGY, AND PROSPECTS FOR THERAPEUTIC INTERVENTIONS

INSTITUTIONS
1. Buskerud Hospital, Unit of Mental Health Research and Development, Division of Psychiatry, Lier/Oslo, Norway

AUTHORS
1. Paul Møller, Dr., PhD, paul.moller@sb-hf.no
2. K Flekkøy, Dr., MD
3. S F Viken, Dr., MD
4. K Hildonen, Dr., MD

Aims/objectives
The rediscovery of the characteristic subjective psychopathology of the schizophrenia spectrum, including the prodrome, provides new directions for etiological research, theoretical understanding, more valid diagnostic and differential diagnostic concepts and prodromal recognition and therapy. The subjective psychopathology points specifically at two early therapeutic aims, namely preservation of insight and alleviation of serious distress through verbalizing the experiences. The aim of this study was to explore preliminarily prodromal insight and its correlates.

Methods
In a routine out-patient setting we measured illness insight (SUMD-R) in 15 potentially prodromal subjects, along with in-depth assessments of subjective (prodromal/schizotypal) psychopathology, standard psychiatric symptoms (PANSS, MADRS) and neurocognitive functioning.

Results
The subjects demonstrated an overall decline of insight, but not to a level of marked reduction, and they were able to discuss and reflect upon symptoms. Reduced insight was associated with higher levels of subjective psychopathology, PANSS symptoms (particularly the negative) and depressive symptoms, but not with levels of objective neuropsychological test scores.

Conclusions
Spoken language is our essential tool for therapy. To preserve prodromal insight, the early subjective psychopathology should not remain silently increasing, but rather be explored systematically as a means to help patients verbalize and adequately reattribute their experiences. Indicated psychological interventions directed at psychotic distortions of self-awareness might have significant effects. The newly published (2005) EASE manual is a practical-theoretical tool for this purpose.
IDENTITY, NARRATION AND PSYCHIC DISTURBANCE

INSTITUTIONS
1. University of Heidelberg, Germany
2. Hannover Medical School, Germany

AUTHORS
1. Thomas Fuchs¹, Prof., MD PhD
2. Jann E Schlimme², Mr., MD MA

The diagnosis of psychic disturbances draws extensively on the narration of the afflicted person. This narration can be understood as a conscious self-interpretation of one's own life-story taking also an interpersonal dimension into account. This basic figure of human identity was conceptualized as a „narrative identity“ by Paul Ricoeur. In the opening lecture the inner logics of the narrative identity and its interpersonal dimension will be discussed.

Talking about oneself and telling a story of oneself affords self-memory and self-assurance. In order to bring forth a narrative identity a certain extent of biographical coherence and some kind of psychological self-transparency is also necessary. Further more all these possibilities are bound to neurocognitive functions. All these conditions are open to impairment in psychiatric disorders resulting in distinctive disorders of one narrative identity. Surely loss of coherence and consequence in the narration appears to be the most prominent feature of psychic disturbances influencing also therapeutic relations. Taking the diagnostic and therapeutic importance of the narration of the afflicted person into account, we have to admit, that more profound questions regarding the concrete and detailed changes of a narrative identity due to the psychic disturbance of the narrator are of outstanding importance for psychiatry. This shall be addressed in the following lectures.

NARRATIVE IDENTITY AND THE OTHER

INSTITUTIONS
1. Scuola Universitaria Professionale della Svizzera Italiana, Switzerland

AUTHORS
1. Guenda Bernegger, Mrs., Mag.

According to Paul Ricoeur, narration is the privileged way of building personal identity. The various and unstructured elements of existence, which are often a product of mere chance, are structured into a meaningful framework through a process of „synthesis of heterogeneous elements“. In this framework these heterogeneous elements are organized in a meaningful story told by a person. Even contingent events happening in life become meaningful in this process and gain a status of a necessary element of the told story. In this story of his life, the subject can recognize himself. The process of narration is therefore never a simple description nor a complete construction, but something in between. Since this narrative identity is always discerning identical and non-identical aspects in its process of being told, „the story that we are“ is not a substantial identity, found once and for all. Quite on the contrary, it is a fragile identity, and due to situational and personal change, it is in permanent need to be re-synthesized in the sense of „continuity in the change“. The otherness is therefore a basic element of the concept of narrative identity. Furthermore the otherness is present in the narrative identity because it is in relation with others. As Adriana Cavarero said: we tell our story to others, to receive in return a story about ourselves.
ADDICTION: NARRATION AND identity

Institutions
1. Hannover Medical School, Germany

Authors
1. Jann eschlimme¹, Mr., MD MA

Addictive behaviour can be understood inner-perspectively via the concept, that the psychotropic technique e.g. consumption of alcohol, becomes absolute with regard to the identity of the afflicted person. This understanding also offers a possible interpretation for the narrations of addicted people. Most prominent in the narrations of the addicted seem to be the frequent repetition of similar stories. Further more these stories seem to lack perspective, are oftentimes short-termed regarding the future or the past of the person, as if they are only taking a very superficial view of the world and the person himself. Yet in special situations the addicted person reports about otherwise hidden and more profound aspects of himself. The narrative identity of addicts can be understood as if it is a short-termed narration monopolized by a few stories, typically centered around the “psychotropic technique”. Yet it is a „fragile monoidentity“, because in its narration it is actively hiding disturbing experiences from his own awareness, that can come to mind in special situations. Implications regarding the traditional understanding of addiction as “dependency” in the psychiatric discourse are discussed.

TRAUMA AND NARRATION

Institutions
1. University of Bern, Clinic and Policlinic for Psychiatry, Bern, Switzerland

Authors
1. Anja Jossen¹, Mrs., Lic. phil., Anja.Jossen@gmx.ch

Persons with PTSD suffer from vivid memories of the trauma and a reduction of their narrative identity to the traumatized self. On the other hand, there is not enough concrete memory of the trauma and its context due to e.g. amnesia. The narrative identity of the traumatized person is established around the self-interpretation of going through and dealing with the traumatic event: Can I see myself as a victim or do I feel guilty for that has happened to me or for having survived? Do I identify myself only as a victim or can I see myself also as a survivor? Can I accept forgetting and to what extent? Do I take what happened to me personally or is there a possibility for me to set it in a more impersonal e.g. political context? Working with war traumatized people for many years I’m convinced that the answers to these questions make a difference to the extent of suffering from traumatic events, whether a person has a feeling of coherence and lives on, being hurt, but not “disturbed”. The goal of therapy is integration of the traumatic event as one event among others into the life-story without it being reduced to the trauma. Then the person sees himself as a survivor who can tell his life-story with all its wounds and strengths, witnessed by the listener who is interested in the whole narration. In this narration the person realizes that he is much more than the trauma itself.
FRAGMENTED SELVES. TEMPORALITY AND IDENTITY IN BORDERLINE PERSONALITY DISORDER

INSTITUTIONS
1. University of Heidelberg, Germany

AUTHORS
1. Thomas Fuchs¹, Prof., MD PhD

The concept of narrative identity implies a continuity of the personal past, present and future. This concept is essentially based on the capacity of persons to integrate contradictory aspects and tendencies into a coherent, overarching sense and view of themselves. In "mature" neurotic disorders, this is only possible at the price of repression of important wishes and possibilities for personal development.

Patients with Borderline Personality Disorder lack the capacity to establish a coherent self-concept. Instead, they adopt what could be called a "post-modernist" stance towards their life, switching from one present to the next and being totally identified with their present state of affect. Instead of repression, their means of defence consists in a temporal splitting of the self that excludes past and future as dimensions of object constancy, bonding, commitment, responsibility and guilt. The temporal fragmentation of the self avoids the necessity of tolerating the threatening ambiguity and uncertainty of interpersonal relationships. The price, however, consists in a chronic feeling of inner emptiness caused by the inability to integrate past and future into the present and thus, to establish a coherent sense of identity.

The paper outlines the concept of narrative identity and explores its disturbances in Borderline Personality Disorder. Finally, the increasing prevalence of these disorders is linked to the development of a mainly externally driven, fragmented character in post-modern society.

PREPARATIONS FOR ICD-11 AND DSM-V

INSTITUTIONS
1. Association for the Improvement of Mental Health Programmes, Geneva, Switzerland

AUTHORS
1. Norman H. Sartorius¹, Dr, MD, PhD, sartorius@normansartorius.com

The symposium will describe the development of classification of mental disorders in the 11th revision of the International Classification of Diseases (ICD) as well as the work on the 5th revision of the Diagnostic and Statistical Manual (DSM) of the American Psychiatric Association.
WHO’S PREPARATIONS FOR THE REVISION OF THE CLASSIFICATION OF MENTAL AND BEHAVIORAL DISORDERS IN THE 11TH REVISION OF THE ICD

INSTITUTIONS
1. World Health Organization, Department of Mental Health and Substance Abuse, Geneva, Switzerland

AUTHORS
1. Benedetto Saraceno, Dr, MD, saraceno@who.int

World Health Organization has the mandate of maintaining and periodically revising the International Statistical Classification of Diseases and Related Health Problems (ICD). The current version (ICD-10) is scheduled to be revised and approved by year 2011. The revision of mental and behavioral disorders within ICD-10 is being led by the Department of Mental Health and Substance Abuse in close collaboration with the Classifications unit of WHO. An Advisory Group of international experts and representatives of various professional international associations has been constituted; this Group has been meeting twice every year since January 2007. The Advisory Group is further assisted by coordinating groups for Global Scientific Partnership (GSP) and Stakeholder Input and Participation (SIP) to ensure that professionals and practitioners from various background and all regions are involved in this international exercise. In addition, WHO together with the American Psychiatric Association has formed the ICD-DSM Harmonization Group to facilitate the achievement of the highest possible extent of uniformity and harmonization between these two classification systems. These preparatory activities have been undertaken with the objective of undertaking the revision that will fulfill the diverse but critical needs from clinical, research, training, public health and statistical perspectives.

ON THE ROAD TO DSM-V AND ICD-11

INSTITUTIONS
1. University of Pittsburgh, Department of Psychiatry, Pittsburgh, United States

AUTHORS
1. David Kupfer, Dr, MD, kupferd@upmc.edu

Aims/Objectives: To present the results of the research review and planning efforts that have occurred in advance of DSM-V and ICD-11 development.

Methods: Current paradigms on psychiatric diagnosis have not adequately embraced many scientific and methodological advances made in the last two decades. Since 1999, a research agenda developed in concert with the APA, NIH, and WHO is providing new approaches and stimulating the empirical research toward the achievement of the following goals: 1) to insure greater clinical utility and relevance; 2) to utilize a developmental approach across the lifespan; 3) to incorporate new knowledge from the neurosciences and the behavioral sciences in elucidating risk factors and prodromal features of disorders; and 4) to adopt methodological strategies utilizing both dimensional and categorical approaches.

Results: A brief review of the recommendations developed from twelve international research planning conferences will be provided. The goals of specific DSM-V study groups examining cross-cutting issues will be addressed. These issues include the following topics: 1) lifespan developmental approaches; 2) diagnostic spectra; 3) psychiatric/general medical interface; and 4) gender and cross-cultural expression. Other important concepts and strategies to promote international collaboration among members of the scientific and clinical communities and alignment with ICD-11 activities will be discussed.

Conclusions: Considerable efforts have been made to ensure that scientific and methodological advances in psychiatry and related fields will be incorporated into the next diagnostic classifications.
THE INTERNATIONAL CLASSIFICATION OF FUNCTIONING, DISABILITY AND HEALTH: RELEVANCE FOR THE CLASSIFICATION OF MENTAL DISEASES

INSTITUTIONS
1. World Health Organization, Classifications and Terminology, Geneva, Switzerland
2. US Dept of Health and Human Services, Washington, United States

AUTHORS
1. Bedirhan Ustun¹, Dr., ustunb@who.int
2. Cille Kennedy²

It is imperative to sort out the incorporation of disability (aka. „social impairment” in DSM) criteria in the formulation of mental disorders. In general health care, one does not require any disability criterion for diagnosis of physical disorders such as diabetes mellitus or tuberculosis. Requirement of social impairment for the diagnosis of mental disorders is a remnant of dualism between physical and mental disorders. This dualism works against the conceptual parity that mental disorders have the same status with all other illnesses. Use of WHO ICF jointly with ICD could assist to operationalize specifically the criteria on DSM „social impairment” rubric. The distinct „disability” dimension from the ICF perspective advocates for separating assessment of disease and disability dimensions, and then utilizing these constructs jointly. The ICF analyzes functioning in relation to a health condition in terms of: (1) body functions and body structures; (2) activities of the person and participation of the person in society and (3) contextual factors such as environmental factors and personal factors. The separation of signs/symptoms and consequences permits better understanding of the disease pathophysiology on the one hand and the consequences (e.g., its impact on the person, family, peers, school, work and social life) on the other hand. It will therefore enable us to better understand the nature of mental disorders because the core body functions associated with the disorder will be delineated better.

INTERNATIONAL CLASSIFICATIONS OF MENTAL DISORDERS: THE NEEDS OF LOW - AND MIDDLE - INCOME COUNTRIES

INSTITUTIONS
1. University of Ibadan, Department of Psychiatry, Ibadan, Nigeria

AUTHORS
1. Oye Gureje¹, Dr, MD, ogureje@comui.edu.ng

Classificatory systems, among other values, promote the use of common language among clinicians and researchers. In a sense, they serve to bring order where there might be chaos and agreement where there might be discordance. They may also advance the cause of evidence-based intervention for disorders and thus improve clinical care. These needs are as compelling in low and middle-income countries (LAMIC) as they are in high income countries. However, these systems can only serve the needs of all countries, including LAMIC, if evidence for their development is based on as broad a scientific and clinical experience as possible. They must also be sensitive to the needs of the end-users: the clinicians. In the particular instance of LAMIC, where research evidence is often thin and sometimes poorly accessible, developers of ICD and DSM must make the extra effort to collect relevant information to serve the needs of the revision process. The systems must also meet the needs of a broad spectrum of clinicians, including the simply-trained primary care providers who commonly provide the bulk of mental health service in LAMIC.

SOURCES OF EVIDENCE RELEVANT TO THE REVISION OF CLASSIFICATIONS: THE EXAMPLE OF GERMAN-SPEAKING COUNTRIES

INSTITUTIONS
1. Henrich-Heine-University Dusseldorf, Department of Psychiatry and Psychotherapy, Dusseldorf, Germany

AUTHORS
1. Wolfgang Gaebel1, Dr, MD, wolfgang.gaebel@uni-duesseldorf.de

Psychiatric classification has a long tradition in German-speaking countries. Psychiatrists like Kraepelin, Bleuler, Schneider and Jaspers formed many of the concepts and defined the essential psychopathological characteristics still in use in the international operationalized classification systems today. ICD-10 is used in Germany, Austria and Switzerland for clinical classification purposes. Tri-country conferences take place regularly to discuss necessary updates, and there is a new revised "German Modification" issue of ICD-10 published annually. In the chapter of mental disorders, changes in the last years were minor. However, there is an initiative to include chronic pain syndromes in the F-category. Also, the field of German psychosomatic medicine has developed a unique operationalized psychodynamic classification scheme. In this presentation, we will discuss in how far experiences from the German-speaking countries may be incorporated in the revision process of ICD-10 and DSM-IV. We will review the German-speaking literature of the last five years regarding the question of psychiatric classification and report on the experience with the current psychiatric classification systems. In this context, we will also report on modularity as a new approach to psychiatric.

ADVANCES IN CONSULTATION LIAISON PSYCHIATRY: DIAGNOSIS OF PSYCHOLOGICAL PROBLEMS IN SOMATIC DISORDERS

INSTITUTIONS
1. Charité University Medicine and Rehab Center Seehof, Research Group Psychosomatic Rehabilitation, Teltow/Berlin, Germany
2. Aarhus University Hospital, The Research Clinic for Functional Disorders and Psychosomatics, Aarhus, Denmark

AUTHORS
1. Michael Linden1, Prof. Dr., michael.linden@charite.de
2. Per Fink2, Prof. Dr., MD, PhD, Dr.Med.Sc., pfink@as.aaa.dk

It is now generally accepted that psychiatry has not only to care for patients with psychotic illnesses but also for the many others with neurotic or reactive disorders. An ever increasing area are patients in the field of somatic medicine. Any illness is a negative life event which forces the patient to cope with many burdens. The resulting interaction between symptoms of the somatic illness on one side and the psychological reaction on the other poses new and difficult diagnostic questions. This symposium discusses diagnostic concepts for mental disorders and problems in patients from general medicine, cardiology, neurology, dermatology and medicine in old age:
SOMATOFORM DISORDERS

INSTITUTIONS
1. Aarhus University Hospital, The Research Clinic for Functional Disorders and Psychosomatics, Aarhus C, Denmark

AUTHORS
1. Per Fink¹, Prof. Dr., MD, PhD, Dr.Med.Sc., pfink@as.aaa.dk

The essential feature of somatoform or functional disorders is that the patients present with morbid excessive illness worrying or with functional somatic symptoms, i.e. medically unexplained symptoms. These disorders are prevalent in all medical settings and may be persistent, disabling, and costly. Despite this, the phenomenon is widely neglected by general psychiatry, and there is a tendency to view the phenomenon as secondary to other mental disorders.

A major problem is that at present we do not have a valid and reliable classification of these disorders. The individual diagnoses of the somatoform disorder category in DSM-IV and ICD-10 are defined in a poor and arbitrary way overlapping each other, and some of the diagnoses are too restrictive for use in clinical practice. Furthermore, no substantial empirical evidence for their validity exists. Besides, many different and overlapping functional somatic syndromes have been introduced and each medical specialty seems to have developed their own syndrome alias, e.g. Chronic Fatigue Syndrome, Fibromyalgia and Irritable Bowel Syndrome.

Establishing more valid diagnostic categories for somatoform disorders is therefore highly needed and one of the most challenging tasks in current psychiatric nosology. This paper will highlight problems in the current classification system and suggestions for new empirically founded diagnostic categories will be indicated.

DELIRIOUS STATES IN DEMENTIA

INSTITUTIONS
1. Evangelisches Krankenhaus Königin Elisabeth Herzberge, Abteilung für Psychiatrie, Psychotherapie und Psychosomatik, Berlin, Germany

AUTHORS
1. Thorsten Kratz¹, Dr., t.kratz@keh-berlin.de
2. Albert Diefenbacher¹, Prof. Dr., k.herrmann@keh-berlin.de

In the past the concept of delirium was associated with different diseases. Even today numerous synonyms of delirium exist. The authors give an overview of the definition of delirium in the past and today. The lecture presents epidemiological data, diagnostic criteria and differential diagnoses of delirium esp. for patients suffering from dementia. Pathological mechanisms, risk factors and triggers as well as different forms of delirium for patients suffering from dementia are discussed. Diagnostics and differential diagnostics are discussed and possible drug and non-drug therapies as well as the prevention of delirium are shown. The authors point out the necessity of education and training of medical staff to prevent or to diagnose early delirium for patients suffering from dementia and to start therapy as early as possible. They finish with a short comment on existing guidelines for the treatment of delirium in the elderly.
PATHOLOGICAL (HYPOCHONDRIAC) REALANGST IN CARDIOLOGICAL PATIENTS

INSTITUTIONS
1. Charité University Medicine Berlin, Research Group Psychosomatic Rehabilitation, Teltow/Berlin, Germany

AUTHORS
1. Michael Linden, Prof. Dr., M. D., michael.linden@charite.de

Objectives: The concept of pathological anxiety or hypochondriasis refers to patients who feel threatened or are afraid to be sick while in reality there is no relevant threat or health problem. In psychosomatic cardiology we see patients who are suffering from deadly illnesses and who can die every moment, so that they are right to be afraid (“Realangst”). Still they react in a hypochondriac manner which causes additional problems for the patient, the course of illness and the physician.

Method: In a specialty inpatient unit for cardio-psychosomatics we regularly see patients with “Hypochondriac Realangst”. The clinical features of this clinical problem and syndrome were assessed.

Results: Hypochondriac Realangst is characterized by the presence of a severe and dangerous cardiac problem, obsessive checking of symptoms by the patient, best knowledge of the patient about rare and newest diagnostic and therapeutic possibilities, repeated stimulation of diagnostic and therapeutic interventions, panic when diagnostic or therapeutic interventions are delayed or when physicians do not comply with patient wishes, aggression towards physicians who do not comply with patient wishes, inability of physicians to distinguish complaints which are due to the somatic illness or anxiety, inability of physicians to say what must be done and what not when patients are exhibiting severe somatic/somatoform symptoms.

Conclusion: Hypochondriac Realangst is a severe and frequent condition which has been ignored so far in the scientific literature. It must be discussed if a new diagnostic category is needed for pathological anxiety under conditions of threat with subdivisions for the field of anxiety.

PSYCHODERMATOLOGY

INSTITUTIONS
1. Anton Proksch Institute, Austria

AUTHORS
1. Michael Musalek, Prof. Dr., MD

Psychodermatological concepts developed in the last century have been mostly nosologically oriented (“disease-oriented”). In the course of the last two decades – mainly due to the development of the syndromatological approaches on the one hand and the increasing international communication within psychodermatology on the other hand – questions of classification gained more and more interest. One of the reasons why problems of diagnosis and classification had been neglected for a long time may be the fact that an effective practice-oriented classification only becomes possible on the basis of a close scientific and practical cooperation between dermatologists and psychiatrists. All classification attempts which do not take into account the various dermatological and psychiatric overlapping areas and the disorders divergent dimensions will be doomed to failure.

The unsatisfactory diagnostic situation was the incentive to develop the Vienna Diagnoses Schedule for Psychodermatological Disorders (VDS), which was created on the basis of clinical experience in psychodermatological treatment units. Such a categorical classification has to be enlarged in clinical practice by a dimensional diagnostic approach, including not only deficiencies but also the resources of the patient in order to provide effective treatment strategies focusing not only on the disorder itself but on the suffering human being in its entirety.
**SOMATIC MULTIMORBIDITY IN THE ELDERLY**

**INSTITUTIONS**

5. Miguel Ángel Quintanilla3, Dr, MD
6. Antonio Campayo4, Dr, MD

**Objectives:**
We test in a representative sample of the elderly population the hypothesis emerged in non-elderly adults that there is an association of somatic and psychiatric morbidity.

**Methods:**
A stratified, random sample of individuals aged 55 and over was selected from the municipal census for the baseline study in the ZARADEMP Project, a longitudinal study intended to document prevalence, incidence and associations of psychiatric and somatic morbidity in the elderly population. Standardized, Spanish versions of instruments used include the Geriatric Mental State (GMS)-AGE-CAT and the History and Aetiology Schedule (HAS). GMS-AGE-CAT criteria were used to diagnose psychiatric cases, and somatic morbidity was documented with the EURODEM Risk Factors Questionnaire.

**Results:**
Reliable information on both, somatic and psychiatric morbidity was available in 4,227 subjects. The frequency of comorbidity was substantial and tended to cluster in a proportion of individuals (44.5%), while only 9.4% of the population was free of either somatic or psychiatric morbidity. In support of the main hypothesis, there was a positive and statistically significant association between somatic and psychiatric morbidity: the proportion of individuals with psychiatric illness was higher among the somatic cases than among the non-cases; and, similarly, the proportion of individuals with somatic morbidity among the psychiatric cases was higher than among non-cases ($X^2 = 5.472, p = 0.019$).

**Conclusion:**
This is the first study documenting in a representative sample of the (predominantly) elderly population that there is a positive and statistically significant association of somatic and psychiatric morbidity.

This paper presents experience gained in the organization of Courses for the Academic Development of Psychiatrists (CADP) in Japan. The (CADP) was developed by Prof. Norman Sartorius and implemented for the first time in 2002 as a joint WPA/JSN project with early career psychiatrists in Japan. In direct response, Japan Young Psychiatrists Organization (JYPO) was established and organized next six CADPs by 2008.

CADP has four key components: 1. Participatory „How to” sessions (e.g. how to give an oral presentation, how to chair meetings) 2. Group work where each group prepares a presentation on an given topic and jointly organize a symposium 3. „Meet the experts” sessions where experts talks about why and how they developed their career in their specialized field, and 4. Thematic workshop (e.g. ethical exercise, evidence-based psychiatry). All sessions are conducted in English.

CADP self-proliferates. About ten new participants are recruited each year. Second-year participants and up serve as organizers, speakers, and chairs. Graduates also organize similar training sessions in other national and international meetings. JYPO assisted the first CADP in Korea in 2007. Five international participants joined CADP in 2008 in Japan.

Objective: To describe the work and process of the WPA Standing Committee on Review

Methods: The WPA Standing Committee on Review reviews individual complaints and initiates investigations on the violations of the ethical guidelines for the practice of psychiatry as stated in the Declaration of Madrid, including its additional guidelines, in order to make recommendations to the Executive Committee as to any possible action. The Review Committee consists of four members (Donna Stewart, John Cox, Otto Steenfeldt Foss, Yubarandt Bespali; John Gunn and Constantin Soldatos consultants; Ahmed Okasha and Harold Eist advisors) and its chairperson (Driss Moussaoui) who regularly meet by email and in person to discuss relevant issues.

Results: The work done from 2005 to 2008, among others, relates to: (1) 2 individual psychiatrists’ complaints about unfair treatment by peers or professional associations (2) 2 complaints about unethical behaviour in psychiatric institution (through media articles) and one questioning working relationship between psychiatrists and police forces (3) Report of NGO on the situation in a developing country of psychiatric institutions.

Conclusions: Both informal and formal methods have been successful in resolving all complaints submitted to date.

SURVEY OF WPA MEMBER SOCIETIES ON CHILD SEXUAL ABUSE AND PHYSICIAN-PATIENT SEXUAL RELATIONS

INSTITUTIONS
1. University Health Network, Women’s Health Program, Toronto, Canada
2. University of Toronto, Faculty of Medicine, Toronto, Canada

AUTHORS
1. Donna Stewart, Dr., MD, donna.stewart@uhn.on.ca
2. Erik Venos, B.Sc., (MD candidate)

Objectives: The Declaration of Madrid (DOM) and its revisions are the WPA’s standards on ethics in Psychiatry (1). This presentation will discuss the results of a survey on Child Sexual Abuse (CSA), and Psychiatrist-Patient Sexual Relations (PPSR) policies by the WPA member societies to inform the audience of international policies and challenges.

Methods: E-mail surveys on CSA and PPSR were sent to 128 WPA member society presidents in 105 countries.

Results: Responses (n=69) represent all world regions. With regard to CSA, all member countries have laws against this, but 18% of countries do not require physicians to report CSA. Only 45% of member societies feel their members are well informed on CSA, and most recommend further education. With regard to Psychiatrist-Patient Sexual Relations, 87% of countries or societies have laws or policies against this. Only 47% of societies feel their members are well informed about PPSR and 100% feel further education would be helpful. Penalties range from death to no action.

Conclusion: The results of this survey show the need for better advocacy, policies, sanctions and education related to CSA and PPSR in many countries and member societies in WPA.

ETHICS CULTURE AND PSYCHIATRY

INSTITUTIONS
1. Institute of Psychiatry, Ain Shams University, Cairo, Egypt

AUTHORS
1. Ahmed Okasha¹, Dr., MD, PhD, FRCP, FRC, aokasha@internetegypt.com

Objective: The presentation will discuss that diversity of cultural differences should not affect a universal pattern of implementing ethics taking cultural context into consideration. The belief of the universality of implementing similar ethical codes in all cultures and societies is a mirage. Informed consent, involuntary admission and confidentiality are not so empowering in some traditional and Eastern societies. Autonomy versus family centered decision is one of the main differences between Western and Eastern societies. The influence of managed care and the third party in mental health services have changed not only Doctor-patient relationship, but also confidentiality. Informed consent in therapeutic alliances and research became a basic human right and has been emphasized in the WPA Declaration of Madrid and its specific guidelines. Encounters between psychiatry and law keep bringing us back to our conflicting conceptions of the value of health on the one hand and the value of liberty, integrity and autonomy on the other. In traditional cultures, social integration is emphasized more than autonomy; that is, the family, not the individual, is the unit of society. Dependence is more natural and infirmity is less alien in these cultures. When affiliation is more important than achievement, how one appears to others becomes vital. How can we practice without showing disrespect or disregard for local values? On the other hand, how can we ensure that respect for the local culture does not become a pretext for bypassing ethical guidelines, to the detriment of patients’ rights?

INDIVIDUAL OR PERSONALISED MEDICINE: DOES THE DIFFERENCE MATTER?

INSTITUTIONS
1. University of Gloucestershire, Faculty of Humanities, Natural and Social Sciences, Cheltenham, United Kingdom
2. World Psychiatric Association, Secretary General, United Kingdom

AUTHORS
1. John Cox¹,², Professor, MD, john1.cox@virgin.net

Objective: To describe differences between individualised and person centred care and give examples of person centred care and assessment strategies with reference to chronic illness.

Integrative medicine and personalised psychiatry are legitimate goals if a health service is to be accessible and comprehensive. This conceptual paper draws on the work of existential philosophers (eg. Buber, Mac Murray) who regard the core person as being in relationship with others; current advocates for personalised medicine (eg. Cloninger, Tournier, Neuberger ); and Values theorists (Fulford). Personalised (relationship based care) is contrasted with individualised care. The presentation will conclude with examples of attempts to integrate personalised care into health services with reference to Dignity conserving care (Chochinov) and Culliford’s method of spiritual history taking. The need for more systematic evaluations and for cost effectiveness studies will be underlined.
The processes underlying psychiatric diseases are clearly extremely complex. Studies of how genes and environment (GxE) interact are likely to contribute substantially to our understanding of these processes. There is increasing evidence that a variation at the 5-HTTLPR locus of the serotonin transporter (5-HTT) gene may modify the risk for depression in response to stressful life events. However, the methodological requirements are high and not all studies published to date meet these high standards.

New methodological approaches to gene-environment interactions (GxE) and new findings form large data bases will be presented and discussed.

Background: There has been a vast but inconsistent literature of interactions between the 5-HTT gene and environment on emotional disorders. However, most studies have involved adult populations. We investigated these interactions in a large birth cohort of pre-pubertal children.

Methods: Longitudinal cohort (ALSPAC) of children aged 81 months. We measured emotional symptoms with the Strengths and Difficulties Questionnaire (SDQ) completed by mothers. An inventory of life events up to the age of 5 was maintained. Maternal depression was assessed with the EPDS at various time points. Triallelic genotyping of the 5-HTTLPR polymorphism was performed.

Results: We found strong associations between stressful life events and postnatal depression with emotional symptoms. However no clear pattern of statistical interactions between the 5-HTT gene and life events or post-natal depression was established. We found a crossover in the association between the 5-HTTLPR gene and emotional symptoms depending on the number of life events experienced. At lower levels of life events, there was an increase in the risk of emotional symptoms in the low gene expression group, in keeping with many previous studies. However this effect was reversed at higher levels of stress with pre-adolescents in the high gene expression group showing increased emotionality in the presence of more life events, particularly among boys.

Conclusions: Gene and environment interactions may be development dependent and show marked variation depending on levels of exposure analysed. Young cohorts followed over time are essential to improve our understanding of the impact of development on gene and environment interactions.
THE RISK FOR MAJOR DEPRESSION - IS THERE AN INTERACTION BETWEEN CHILDHOOD TRAUMA AND THE 5-HTTLPR LOCUS OF THE SEROTONIN TRANSPORTER GENE?

4. Daniela Becker1
5. Andrea Schulz1
6. Dieter Rosskopf1, Dr., MD
7. Katja Appel1
8. Harald J Freyberger1

Aims/Objectives: The processes underlying psychiatric diseases are clearly extremely complex. Studies of how genes and environment (G x E) interact are likely to contribute substantially to our understanding of these processes. There is increasing evidence that a variation at the 5-HTTLPR locus of the serotonin transporter (5-HTT) gene may modify the risk for depression in response to stressful life events. However, the methodological requirements are high and not all studies published to date meet these high standards.

Methods: Based on the prospective Study of Health in Pomerania (SHIP-1, N=3300) an elaborated assessment of childhood and adult life stressors and protective psychosocial factors is performed. Psychiatric lifetime-diagnoses are assessed by face to face interviews according to DSM-IV.

Results: A detailed description of the methods developed for this G x E study will be given. Preliminary results will be presented on n=1000 subjects of this ongoing study.

Conclusion: Psychosocial conditions in childhood are likely to moderate the vulnerability for major depressive disorders in adulthood and thereby the vulnerability for G x E effects to occur. We hypothesize that G x E effects are larger in subjects with childhood trauma and stressors as the maturation of neurobiological systems may be altered.

MODELLING EFFECT SIZES IN GENE X ENVIRONMENT INTERACTIONS

The original report of a moderating effect of the 5-HTTLPR polymorphism on the association between SLEs and risk of major depression indicated that, with zero exposure to SLEs, there was no difference between 5-HTTLPR genotype groups in risk of major depression. However, as the number of SLEs increased, the risk of major depression increased among those individuals carrying one or more copies of the S allele (in a dose-dependent manner). Among LL homozygotes, increasing SLEs did not result in an increased risk of major depression. These data were taken as clarifying the nature of the biological mechanisms underlying risk of major depression, and the contribution of 5-HTTLPR genotype and exposure to SLEs.

We conducted a systematic review of the 5-HTTLPR x SLE literature to establish the strength of evidence for this G x E effect. In particular, we reviewed both the statistical evidence for a G x E interaction across studies using meta-analytic techniques, and the qualitative nature of the interaction effects reported across studies as part of a systematic review. We used the estimates of the main effects of genotype and environment from the meta-analysis to investigate by simulation the likelihood of detecting G x E, under different models. We report the statistical power for a range of plausible genetic and environmental main effects, and discuss these findings in the context of the existing literature.

This paper is submitted as part of the symposium Gene-Environment-Interactions in Mental Disorders: New Findings and Methodological Issues.
SEROTONIN TRANSPORTER GENE AND ADVERSE LIFE EVENTS IN ADULT ADHD

Childhood Attention deficit hyperactivity disorder (ADHD) symptomatology persists in a substantial proportion of cases into adult life. ADHD is highly heritable but the etiology of ADHD is complex and heterogeneous, involving both genetic and non-genetic factors. In the present paper we analyzed the influence of both genetics and adverse life events on severity of ADHD symptoms in 110 adult ADHD patients. Subjects were genotyped for the norepinephrine transporter (NET), the Catechol-O-methyltransferase (COMT), the serotonin transporter promoter polymorphism (5HTTLPQ) and the more rare A/G variant within 5HTTLPQ. Three main outcomes were obtained: (1) adverse events showed a small but positive correlation with current ADHD severity; (2) NET, COMT and the A/G variant within 5HTTLPQ were not associated with ADHD severity; (3) taking into account stressors, the long (L) 5HTTLPQ variant showed a mild effect on ADHD, being associated with an increased severity, particularly as regard affective dysregulations; on the other hand, in subjects exposed to early stressors, it showed a protective effect, as compared to the S variant. In conclusion, our data support the role of environmental factors in adult ADHD symptomatology. 5HTTLPQ may be involved in some features of the illness and act as a moderator of environmental influences in ADHD.

MONITORING EQUITY IN MENTAL HEALTH FROM A CROSS-NATIONAL PERSPECTIVE

INSTITUTIONS
1. University Health Network, Women’s Health Program, Toronto, Canada

AUTHORS
1. Donna E Stewart¹, Dr., MD, FRCPC, donna.stewart@uhn.on.ca

Mental health remains on the forefront of the public health agenda (1,2). Disparities in mental health highlight the need to include equity measures in the process of planning, implementing and evaluating mental health programs at national, provincial and municipal levels (1). This symposia will: 1) outline the extent of inequity in determinants of health and national health policies and how these may affect a population’s mental health (Chair, Donna E Stewart)(2); 2) present the feasibility of monitoring equity in mental health in lower, middle and high income countries (Natalia Diaz-Granados); 3) highlight how sociodemographic factors influence the prevalence rates of depression and anxiety differently across countries (Marta Rondon); 4) examine specific factors that affect mental health service accessibility from a low-income country perspective (Javier Saa-vedra); and 5) demonstrate how income may drive gender inequities observed in mental health utilization (Marie DesMeules)

Learning objectives:
- To identify factors that drive inequities in mental health in lower, middle and high income countries
- To understand why monitoring of mental health and illness is important to ensure quality care and accessibility of services.

Objective: This study assesses the feasibility of measuring determinants of health and health policy indicators in a low-income country.

Methods: This study exposed an expert panel to potential indicators (1) which were independently ranked and consensually selected for measurement. The selected core list consisted of 17 indicators on the determinants of health and 10 health policy (2).

Results: The feasibility of measuring these indicators using available reports and data was assessed for all three countries and it was found 14/17 determinants of health indicators and 10/10 policy indicators were feasible. Data sources used to measure the selected core set of gender-sensitive general health indicators, included health surveys such as the Canadian Community Health Survey and National Demographic and Household Studies (Peru/Colombia), as well as mortality and hospitalization data. Analyses and data from reports were abstracted & stratified by sex, age, education, marital status, socio-economic level, and specific sub-groups: immigrant status, urban/rural status and poverty level, where possible. Policy indicators were linked with indicators on determinants of mental health.

Conclusion: Knowledge of indicators on determinants of health and health policies that affect the mental health of a population will be invaluable to researchers, health professionals and policy makers and will provide stakeholders with a base to create and improve programs aimed at reducing inequities in health.

Objective: This study set out to test the feasibility of measuring and comparing 19 mental health indicators in Peru, Colombia and Canada. Methods: The indicators were selected at a meeting in Colombia by a group of key experts using a health information framework proposed by WHO (1). Indicators (2) were measured using national, population-based databases and age-adjustments were performed using a WHO age distributions. Results: Colombia and Canada’s surveys had 5 indicators that were comparable with few modifications. Out of the first 9 indicators assessed (12 month prevalence of: depression, psychological distress, GAD, suicide attempts, alcohol dependence/abuse, social support, use of mental health services, psychological impairment, psychological well-being, all were feasible except for the measurement of self-esteem in Peru, Colombia and GAD in Canada. The indicators that show greatest inequities are: depression, GAD, suicide attempts, use of mental health services and alcohol dependence/abuse. Female to male ratios ranged from 1.5-2.2. Significant trends were found when the indicators were considered by age, education, marital status and income.

Conclusions: These indicators can be used to identify those patient populations most vulnerable to inequities in mental health. The results from this study will provide vital information to program planners who aim to implement, improve and monitor national mental health strategies that reduce gender inequities in different national economic conditions.

SOCIODEMOGRAPHIC FACTORS AFFECT MENTAL ILLNESS RATES DIFFERENTLY ACROSS COUNTRIES

10. Marie Des Meules6, Mrs., Marie_DesMeules@phac-aspc.gc.ca

Objective: Cross country comparison of rates of depression and anxiety support the assertion that sociodemographic factors play a vital role on the prevalence of mental illness among women and men (1). To show the impact of social factors in a 3 country mental health indicator study.

Methods: Secondary analyses of existing, national, population-based mental health surveys from Peru, Colombia, and Canada were performed.

Results: Data shows that, in general, people with better access to social protection, higher education, employment and mental health care fare better. Women had higher rates of depression and anxiety than men in comparable circumstances. There are some exceptions that need further study: in Colombia men in the upper income quartile have more problems with anxiety compared to Colombian women, and men in Peru and Canada. In the three economically different settings, women who are separated, divorced or widowed suffer most, reflecting the burden of loneliness and social isolation, as well as poverty. The male/female disparity is highest in this group.

Conclusions: Our results call for a stronger integration of social and biological perspectives (2), in the management and research agendas focusing on mental illnesses with the highest social inequities.

FACTORS ASSOCIATED WITH INEQUITIES IN MENTAL HEALTH CARE USE IN A DEVELOPING COUNTRY

INSTITUTIONS
1. Instituto Nacional de Salud Mental, Oficina de Apoyo a la investigación y Docencia Especializada, Lima, Peru
2. Universidad Peruana Cayetano Heredia, Lima, Peru

AUTHORS
1. Javier Saavedra1,2, Dr., PhD, saavedra@terra.com.pe

Objective: To identify patterns and factors associated with the utilization of services for mental health problems in an adult population of a developing country (1).

Methods: A population-based, 3-stage probabilistic survey sampled 2,400 residents from Lima and Callao households. Data included demographics, mental health care utilization; the Colombian Mental Health Questionnaire (modified); and the M.I.N.I (ICD-10).

Results: There were 2077 respondents. Compared to men, women reported more mental health problems in the preceding 6 months (20.8% vs. 14.0%; p=0.001) and received more health care (5.4% vs. 2.7%; p=0.007). Of those reporting no use, more women than men thought they may have needed it (66.6% vs. 44.5%; p=0.007). More women not seeking care due to “shame” (p=0.002), and for “fear as being seen as a mentally ill person”(p=0.003). Logistic regression shows that women’s use of mental health care was associated with having health insurance, reduced prejudice issues, increased family suggestion and communication, receiving medical attention for physical conditions, and past traumatic experiences. Men’s use was related to increased age, having health insurance, reduced prejudice issues, family suggestion, and the presence of panic disorder.

Conclusions: Differences exist in health seeking behaviours among residents in a developing country which may differ from those in developed countries (2). The results of this study suggest that in many instances different approaches have to be used when planning for interventions to promote better mental health care in men and women.

7. Marie DesMeules1, Marie_desmeules@phac-aspc.gc.ca

Objective: Disparities in country development, mental health services coverage, and income level affect mental health status and service utilization (1, 2). This study compares 12-month utilization of outpatient mental health services in a high-income country (Canada with national coverage for mental health services for most services) and a middle-income country (Colombia with no national coverage for mental health services) to examine income-related inequities in mental health service use.

Methods: Canadian Community Health Survey and National Study of Mental Health (Colombia) data were used. Stratified age-standardized rates were compared using rate ratios.

Results: The proportion of respondents using mental health services in the prior 12-month period was significantly lower in Colombia (4.4%) than in Canada (10.3%). Women used more services than men but the inequity was greater in Canada (Female: 13.5%, Male: 7.1%) than in Colombia (Female: 5.0%, Male: 3.8%). In Colombia, lowest use was found among low income men (1.1%), and this income bracket showed the highest sex disparity (Female/Male rate ratio =6.3). Highest use in Colombia was noted among high income men (7.6%) contrary to Canada in which it was noted among low income men (12.6%).

Conclusion: There is inequity in mental health service utilization by gender, income levels and country development. The disparities observed in this study partially reflect unmet need for mental health services due to cost. Alleviation of these unmet needs will require expansion and optimal allocation of services and resources.

DISASTER PSYCHIATRY IN NEW CENTURY

INSTITUTIONS
1. Ain Shams Faculty of Medicine, Neuropsychiatry, Cairo, Egypt

AUTHORS
1. Nahla El Sayed Nagy1, Prof. Dr., MD, nahlanagy64@yahoo.com

This symposium covers overview for Disaster psychological impairment.

Posttraumatic stress disorder in children (Prof. Nahla Nagy, Egypt)
Children impacted by disasters, including earthquakes and man made wars may be exposed to economic loss, relocation and mental health issues and Post Traumatic Stress Disorder (PTSD). School psychologists are encouraged to attend trauma mental health training to help children living in areas at risk.

Tsunami (Professor U. Pichet, Thailand)
Prevalence of psychiatric and somatic symptoms in 24 months after the 2004 tsunami, was depression and anxiety 21%, 16% and PTSD as 30%. Culturally-relevant coping activities showed that majority found their strength, in family support, and their religious practice.

Pakistan’s earthquake (Prof. Haroon Chaudhury, Pakistan)
Visiting the area in Pakistan affected by October’s earthquake, having provided care to people suffering in its aftermath. The distressing scenes from generations been lost; millions of people left homeless and thousands of children orphaned. There was an outpouring of charity from the public and a rush to the scene of scores of emergency relief organizations. These ranged from recognized, regulated official organizations to unregulated groups.

Complicated practice in disasters (E Naeem, UK)
Volunteer doctors do more harm than good. Foreign doctors were unable to communicate with patients because of language barriers. Some patients had no clinical indication for a plaster cast , after immobilization, suffered muscle atrophy and joint stiffness. Continual varying management plans that changed as frequently as the volunteer doctors.

BIOLOGICAL DETERMINANTS AND MANAGEMENT OF AUTISM

INSTITUTIONS
1. Ain Shams Faculty of Medicine, Neuropsychiatry, Cairo, Egypt

AUTHORS
1. Nahla El Sayed Nagy, Prof. Dr., MD, nahlanagy64@yahoo.com

This symposium covers biological determinants and therapeutic modalities of autism
Biological aspects of autism (Prof. Nahla N, Egypt)
The clinical presentation in autistic children could be correlated with dysfunctional brain circuits through analysing the results of electroencephalography (EEG), Magnetic Resonance Imaging (MRI), Bain Auditory Evoked Potentials (BAEP) and genetic susceptibility.
Psychiatric and cognitive deficits in autism (Prof. Tarek O, Egypt)
Comprehensive, multidisciplinary assessment is required to evaluate a child for an ASD and to differentiate ASDs from other developmental disorders. Autism is characterized by impaired reciprocal social interaction, impaired communication, and restricted, stereotypic, or stereotyped behaviors.
Referral system in autism (Prof. Hisham R, Egypt)
Pediatric doctors and primary health care clinicians may have important role in both the early identification and management of children with autism. Referral is recommended for any child who does not babble or point or use other gestures for social communication.
Pharmacological treatment in autism (Dr. Faria Khan, London)
There are no Food and Drug Administration-approved indications for the treatment of autism. Risperidone may be used in managing tantrums, aggression, and self-injurious and stereotypic behaviors while methylphenidate to manage inattentive, impulsive, and hyperactive behaviors.
Behavioral approach in autism (Prof. Haroon Chaudhury, Pakistan)
Applied Behavior Analysis (ABA) technique uses the principles of operant conditioning to teach specific social, communicative, and behavioral skills to children with ASD. The TEACCH approach takes advantage of relative strengths in visual information processing. Sensory integration therapy is often used in special education programs.

TINNITUS: A NEUROPSYCHIATRIC DISORDER. NEW METHODS OF DIAGNOSES AND TREATMENT

INSTITUTIONS
1. University of Regensburg, Germany
2. TRI Tinnitus Clinic Antwerp, Antwerp, Belgium

AUTHORS
1. Berthold Langguth, Dr, MD
2. Dirk DeRidder, Dr, MD

The proposed symposium will present the neurobiological basis of chronic tinnitus and implication for new treatment strategies.

FUNCTIONAL AND STRUCTURAL IMAGING IN CHRONIC TINNITUS

INSTITUTIONS
1. University of Regensburg, Germany

AUTHORS
1. Michael Landgrebe, Dr, MD
2. Katharina Rosengarth
3. Tobias Kleinjung
4. Peter Eichhammer, Dr, MD
5. Goeran Hajak, Dr, MD, PhD
6. Berthold Langguth, Dr, MD

Objective: Tinnitus is a frequent auditory sensation often entailing high morbidity and progressing to a chronic debilitating condition. Until recently, the pathophysiology of chronic tinnitus has been largely unknown and efficient treatments are rare. However, in recent years, neuroimaging has opened new possibilities for understanding tinnitus. Positron emission tomography (PET), functional and structural magnetic resonance tomography (fMRI and voxel-based morphometry; VBM) allowed to identify cortical networks, which seem to be involved in the generation of chronic tinnitus.

Methods: A comprehensive review of the recent literature will be given and own results will be presented.

Results: PET- and fMRI-studies point to alterations of neuronal activity in the central auditory system (e.g. primary auditory cortex), but also in non-auditory brain areas. Furthermore, structural changes in the thalamus maybe found in tinnitus patients.

Conclusions: These findings give further insight into the pathophysiology of chronic tinnitus. Furthermore, new treatment strategies (e.g. repetitive transcranial magnetic stimulation) have already been developed based on these findings.
THE NEURONAL CODE OF TINNITUS - RESULTS FROM EEG/MEG AND IEEG MEASUREMENTS

INSTITUTIONS
1. TRI Tinnitus Clinic Antwerp, Belgium

AUTHORS
1. Dirk De Ridder¹, Dr
2. Elsa van der Loo¹
3. Mark Plazier¹
4. Tomas Menovsky¹
5. Paul van de Heyning¹

Objectives: Auditory information processing in the auditory cortex might be associated with synchronized 40 Hz or gamma-band frequency firing. Dysrhythmia of thalamocortical firing has been proposed as a pathophysiological process present in neurogenic pain, tinnitus, Parkinson’s disease, or depression. Therefore, EEG activity has been investigated in tinnitus patients.

Methods: Quantitative EEGs were performed in patients with uni- and bilateral tinnitus in a soundproof area. Spectral analysis with specific attention to theta and gamma band firing was analysed. In addition, iEEG recording from implanted electrodes was correlated to EEG, MEG and fMRI activity.

Results
1. a. Patients demonstrate a spontaneous hotspot in the beta and gamma range within the auditory cortex, contralateral to the side to which the tinnitus is referred or bilaterally in bilateral tinnitus.
2. a distress network consisting of the right amygdala, right anterior cingulated, right insula and right BA10 area significantly correlates with the amount of tinnitus related distress
2. A significantly high correlation (0.8) can be found between iEEG and 2 ICA components
3. iEEG correlations with MEG activity are described
4. BOLD activity on fMRI co-localizes with theta activity which is present only on these electrodes where tinnitus suppression can be induced by electrical stimulation of the auditory cortex.

Conclusions: These preliminary results suggest that qEEG with LORETA transformation might be a method to objectivate tinnitus, as well as the distress it induces by looking for its neural correlates in the auditory cortex. Thalamocortical dysrhythmia might be a pathophysiological mechanism explaining tinnitus.

Objective: Chronic tinnitus is a frequent disorder which is difficult to treat and which is frequently associated with depression, anxiety and insomnia. Worldwide no drug has been approved for the treatment of tinnitus.

Method: Review of the literature about central acting drugs for chronic tinnitus and its comorbidities

Results: Treatment results will be discussed with special consideration of methodologic limitations.

Conclusion: No treatment can yet be considered well established in terms of providing replicable long-term reduction of tinnitus impact, in excess of placebo effects. However careful evaluation of available studies suggests that there are subgroups of patients, which might benefit from treatment with specific central acting drugs. Further studies are needed to determine predictors for beneficial treatment outcome for specific patients.
TINNITUS AND TRANSCRANIAL MAGNETIC STIMULATION (TMS)

INSTITUTIONS
1. University of Prague, Department of Psychiatry, Czech Republic

AUTHORS
1. Jana Dvorakova1, Dr
2. Martin Anders1, Dr, MD
3. Jiri Raboch1, Dr, MD

OBJECTIVE: Tinnitus is a frequent disorder which is very difficult to treat. Even if the underlying pathophysiology is not known in detail, there is compelling evidence, that tinnitus is associated with functional alterations in the central nervous system. Both functional imaging studies in tinnitus patients and electrophysiological studies in animal models of tinnitus indicate hyperactivity in the central auditory system, probably due to increased synchronicity. Therefore targeted modulation of tinnitus related cortical activity has been proposed as a promising new treatment approach.

METHOD: Repetitive transcranial magnetic stimulation (rTMS) is a non-invasive method which allows to focally modulate cortical activity. We used rTMS as a treatment for tinnitus by applying repeated sessions of low frequency rTMS, in order to induce a lasting reduction of cortical excitability in the auditory cortex.

RESULTS: A reduction of tinnitus complaints has been reported by a subgroup of patients

CONCLUSION: Our results support, that rTMS represents a promising new tool for treatment of tinnitus. Further development of this technique will depend on a more detailed understanding of the neurobiological effects which mediate the clinical effects of TMS.

NEUROSURGICAL TREATMENTS FOR TINNITUS

INSTITUTIONS
1. TRI Tinnitus Clinic Antwerp, Belgium

AUTHORS
1. Dirk De Ridder1, Dr, MD
2. Tomas Menovsky1
3. Paul van de Heyning1

Objective: Most treatments proposed for tinnitus are non-surgical, to such an extent that it is sometimes forgotten that a certain amount of patients with the symptom tinnitus can potentially benefit from a surgical solution. The aim of the paper is to review the possible otoneurosurgical approaches in tinnitus treatment, treating the tinnitus causally or symptomatically.

Methods: a pubmed search on the words ‘surgery’, ‘tinnitus’ and ‘pulsatile’ is performed and compared to the authors’ personal experience with surgical approaches for alleviating tinnitus. The most relevant different pathologies presenting as pulsatile and non-pulsatile tinnitus are given and possible otoneurosurgical approaches for these identities summarized.

Results and discussion: Non-pulsatile tinnitus can be the clinical expression of vestibular schwannomas and other cerebellopontine angle lesions, arachnoid cysts, Ménière’s disease, otosclerosis, brain tumors along the auditory pathways, Chiari malformations and microvascular compressions of the vestiblovocochlear nerve. Symptomatic improvement of non-pulsatile tinnitus can also be obtained by electrical stimulation of the cochlea, auditory nerve or cortex. Pulsatile tinnitus can present as a venous hum resulting from benign intracranial hypertension, Chiari Malformation and a high jugular bulb. Arterial pulse synchronous tinnitus can be caused by benign intracranial hypertension, arteria carotid stenosis, glomus tumors, vascular lesions of the petrous bone and skull base, arteriovenous malformations, aneurysms, and vascular loops inside internal auditory canal.

Conclusion: before people are told ‘to learn and live with their tinnitus’ a thorough exploration for a possible cause and potential surgical treatments can be offered in patients presenting with incapacitating tinnitus
Based on recent advances in the understanding of the neurobiology of neuropsychiatric disorders, minimal invasive brain stimulation techniques emerge as a new treatment option. In this symposium, an overview will be given about the use of transcranial magnetic and electrical stimulation for the treatment of depression (Padberg), schizophrenia (Prikryl) and somatoform disorders such as tinnitus (Langguth), chronic pain (Lefaucheur) and fibromyalgia (de Ridder).

INNOVATIVE BRAIN STIMULATION FOR THE TREATMENT OF DEPRESSION

Given that a considerable proportion of depressed patients does not remit during pharmacotherapy, there is increasing interest in non-pharmacological strategies to treat depressive disorders. Several neurostimulation approaches are currently tested as novel antidepressant interventions including repetitive transcranial magnetic stimulation (rTMS), magnetic seizure therapy (MST), vagus nerve stimulation (VNS), deep brain stimulation (DBS) and transcranial direct current stimulation (tDCS). All methods act via different neuroanatomically defined pathways involving key regions for affective behaviour and the pathophysiology of depression, i.e. prefrontal cortex/anterior cingulate, nucleus accumbens, striatum, amygdala and others. The different methods vary regarding their degree of invasiveness ranging from non-invasive and non-convulsant transcranial approaches (rTMS, tDCS) to methods requiring surgery (VNS and DBS) and meet different subsyndroms of depression (acute, frequently recurrent or chronic; mild to severe; melancholic, atypical, psychotic etc.). The most comprehensive data is now available for rTMS in moderately therapy-resistant patients with a positive meta-analysis of small controlled trials and a placebo-controlled multicenter trial showing a significant difference between active and sham treatment. For VNS interesting long-term data are available suggesting long-term efficacy, however, an acute study failed to show significant antidepressant effects. For tDCS, three small controlled trials have been published by one research group, but need to be replicated by others and for MST and DBS only case series and open trials have been published yet. The placement of neurostimulation approaches among antidepressant interventions will depend on their efficacy in comparison with established treatment, the potential of methodological progress and cost-effectiveness considerations.
TREATMENT OF NEGATIVE SYMPTOMS OF SCHIZOPHRENIA USING TMS

Objective: To verify whether high-frequency rTMS applied above the area of the left prefrontal cortex in 15 stimulation sessions with maximum stimulation intensity is able to modify negative symptoms of schizophrenia in a double-blind, randomized controlled study.

Methods: Twenty-two patients with schizophrenia stabilized on antipsychotic medication with prominent negative symptoms were included in the trial. They were divided into two groups: eleven were treated with effective rTMS and eleven with ineffective “sham” rTMS. The ineffectiveness of the sham rTMS was achieved through the stimulation coil position. Stimulation was applied to the left dorsolateral prefrontal cortex. The stimulation frequency was 10 Hz. Stimulation intensity was 110% of the motor threshold intensity. Each patient received 15 rTMS sessions on 15 consecutive working days. Each daily session consisted of 15 applications of 10-second duration and 30-second intervals between sequences. There were 1500 stimuli per session.

Results: During real rTMS treatment a statistically significant decrease of negative symptoms was found (approximately 29% reduction in the PANSS negative symptom subscale and 50% reduction in the SANS). In sham rTMS treatment a decrease of negative symptoms was also identified, but to a lesser extent than in real rTMS (about 7% in negative subscale PANSS and 13% in SANS). The change in SANS achieved statistical significance. Mutual comparison revealed a greater decrease of negative symptoms in favor of real rTMS in contrast to sham rTMS.

Conclusion: Our results support the therapeutic potential of rTMS at higher frequency for negative symptoms of schizophrenia.

TINNITUS AND TRANSCRANIAL MAGNETIC STIMULATION

INSTITUTIONS

Tinnitus is a frequent disorder which is very difficult to treat. Even if the underlying pathophysiology is not known in detail, there is compelling evidence, that tinnitus is associated with functional alterations in the central nervous system. Both functional imaging studies in tinnitus patients and electrophysiological studies in animal models of tinnitus indicate hyperactivity in the central auditory system. Therefore targeted modulation of tinnitus related cortical activity has been proposed as a new therapeutic approach.

Repetitive transcranial magnetic stimulation (rTMS) is a non-invasive method which allows to focally modulate cortical activity. This technique has been applied in different ways for diagnosis and treatment of tinnitus. Single sessions of high frequency rTMS over the temporal cortex have been successfully used for transient suppression of tinnitus and seem to be a useful predictor for treatment outcome of epidural stimulation. Another approach aims at using rTMS as a treatment for tinnitus by applying repeated sessions of low frequency rTMS, in order to induce a lasting reduction of cortical excitability in the auditory cortex. Beneficial effects of this treatment have been consistently demonstrated in several controlled studies however results are characterized by high interindividual variability and only moderate effect sizes.

There is convincing evidence that rTMS represents a promising tool for diagnosis and treatment of tinnitus. Further development of this technique will depend on a more detailed understanding of the neurobiological effects which mediate the clinical effects of TMS.
RTMS AND CHRONIC PAIN

INSTITUTIONS
1. Hopital Henri Mondor, Service de Physiology, Paris, France

AUTHORS
1. Jean-Pascal Lefauheur
2. Rechdi Ahdab

The efficacy of repetitive transcranial magnetic stimulation (rTMS) to produce analgesic effects has been assessed in patients with drug-resistant chronic pain of various origins, mainly neuropathic. Motor cortex was the most studied target, a few results concerned prefrontal or somatosensory cortical areas. In nearly all controlled studies, verum motor cortex rTMS produced significant analgesic effects compared to placebo (sham) stimulation when at least 1000 pulses were delivered at high-frequency (5-20Hz). After a single rTMS session, analgesic effects lasted for less than one week. Repeated daily sessions were able to prolong the effects of a single session. On average, high-frequency motor cortex rTMS decreased pain scores by 25-30% (10% following sham-rTMS). In contrast to chronic epidural motor cortex stimulation, rTMS was found more effective after stimulating an area adjacent to the cortical representation of the painful zone rather than the area of the painful zone itself. The analgesic effects produced by motor cortex rTMS could result, at least partly, from the restoration of defective intracortical GABAergic inhibitory processes. Motor cortex rTMS could also relieve pain by reducing neuronal hyperactivity in thermal sensory relays distant from the site of stimulation. Finally, a positive response to high-frequency rTMS could predict a positive outcome of subsequent chronic epidural cortical stimulation. Due to the modest and short-lasting effects that are produced, rTMS cannot be applied to treat chronic neuropathic pain in routine. However, it may be proposed to treat transient pain or to identify suitable candidates for epidural implant.

C2 STIMULATION AS A TREATMENT FOR FIBROMYALGIA AND CHRONIC FATIGUE SYNDROME

INSTITUTIONS

2. Griffin Hospital, Pain management section, Derby, United States

AUTHORS
1. Dirk de Ridder
2. Mark Thimineur
3. Mark Plazier

Objectives: The aim of the study was to evaluate the effect of subcutaneous C2 stimulation on the widespread fibromyalgia related bodily pain, associated chronic fatigue, mood depression, and quality of life in fibromyalgia patients, and to propose hypotheses explaining the working mechanism.

Materials and methods: 12 patients (9 females and 3 men; mean age 48 years) who met the criteria proposed by the American College of Rheumatology for fibromyalgia, and with co-morbid chronic fatigue, were trialed and implanted with this C2 stimulation technique. Outcome was prospectively studied with standard evaluation tools at baseline, and 3 and 6 month post implantation.

Results: VAS pain levels for FM related bodily pain decreased significantly at 6 months (p < .0001), as well as pain drawing total area (p < .0001) and number of areas colored in (p < .0005). Chronic fatigue and depression as assessed by the Fatigue Impact Scale and the Beck Depression Inventory were also markedly improved (p < .0001 for both). Overall quality of life as assessed by the SF36 was significantly better on all 8 subscales.

Conclusion: C2 scalp stimulation may diminish widespread bodily pain and associated co-morbid symptoms in patients with fibromyalgia by modulation of 1. spinothalamic pathways in the myelum suppressing bodily pain, 2. autonomic nervous system suppressing co-morbid symptoms 3. mesolimbic dopaminergic system improving mood and 4. arousal system for fatigue. Future studies will have to elucidate which of the proposed mechanisms are involved in the improvement of fibromyalgia and chronic fatigue using this stimulation technique.
This symposium will review the core aspects of molecular genetics that are necessary to understand pharmacogenomic medication management. Subsequently, the use of genetic testing to help manage depressive illnesses will be reviewed. Next, genomic considerations that are relevant for the treatment of addictions will be presented. Finally, a series of specific cases will be presented that illustrate the clinical utility of pharmacogenomic testing.

Dr. John L. Black, III will review the basic principles of molecular genetics that are specifically relevant for pharmacogenomic testing. This will include a review of the vocabulary that is necessary to describe gene structure and expression. A focus of this review will be on the clinical significance of genetic variation in pharmacogenomic informative genes. The implications of single nucleotide polymorphisms, indel polymorphisms and copy number variations will be presented. This review will include a discussion of haplotype structure, as well as biotechnological advances that have made genotyping and high throughput sequencing possible.
CLINICAL PSYCHIATRIC PHARMACOGENOMICS: THE MAYO CLINIC EXPERIENCE - APPLICATIONS FOR THE MANAGEMENT OF ANTIDEPRESSANT MEDICATION

INSTITUTIONS

4. Peter Fedor-Freybergh, Dr., MD, editor@nel.edu

According to recent findings stress experiences represent significant condition in pathophysiology of depression and influence abnormal development in the brain. Repeated stress frequently leads to dissociation and limbic irritability that determines various somatisation symptoms in unipolar depressive patients. Main objective of the symposium is to present research data that show novel relationships among psychoneuroendocrinological and psychophysiological data and psychometric measures of dissociation and symptoms of traumatic stress in depressive patients.
DEPRESSION, DISSOCIATION AND PAINFUL PHYSICAL SYMPTOMS

INSTITUTIONS
1. Charles University, First Faculty of Medicine, Department of Psychiatry, Prague, Czech Republic

AUTHORS
1. Jiri Raboch

Purpose: Recent findings in cognitive neuroscience indicate that activation of anterior cingulate cortex (ACC) is related to detecting cognitive conflict, dissociation and pain. Conflict related and pain experience induced ACC activation elicits responses in central autonomic network which can be assessed by psychophysiological measures such as heart rate variability (i.e. beat to beat R-R intervals-RRI). Recent findings in neuroscience also suggest that cognitive conflict is related to specific nonlinear chaotic changes of the signal generated by the neural systems.

Method: The present study used Stroop word-colour test as an experimental approach to the study of cognitive conflict in connection with RRI measurement, psychometric measurement of dissociation (DES), somatoform dissociation (SDQ-20), and calculation of largest Lyapunov exponents in nonlinear data analysis of RRI time series in 50 patients with unipolar depression (i.e. depressive period or recurrent depression).

Result: Significant correlation 0.57 (p=0.00006) between largest Lyapunov exponents and DES, and 0.45 (p=0.0017) between largest Lyapunov exponents and SDQ-20 found in this study indicate that cognitive conflict related defect of neural inhibition during conflicting Stroop task is closely related to dissociative processes and depression.

Conclusion: These findings suggest the hypothesis that specific nonlinear dynamics governs the brain processes that link psychological pain related to dissociation and somatoform dissociation related to painful physical symptoms as a consequence of ACC activation.

DEPRESSION AND PERSPECTIVES OF CHAOS THEORY FOR UNDERSTANDING OF STRESS-RELATED SENSITIZATION

INSTITUTIONS
1. Charles University, First Faculty of Medicine, Department of Psychiatry, Prague, Czech Republic

AUTHORS
1. Petr Bob

Purpose: According to recent findings stress experiences represent significant condition in pathophysiology of depression and influence abnormal development in the brain. Repeated stress and cognitive conflict also may determine limbic irritability and temporal-limbic epileptic-like activity. Because recent findings indicate that epilepsy and epileptiform processes are related to increased neural chaos, in the distinct contrast to normal brain activity, the aim of this study is to find relationship between neural chaos in autonomic responses reflecting brain activity during stress activation and limbic irritability.

Method: For empirical examination of suggested hypothesis Stroop word-colour test, ECG recording, calculation of chaos indices i.e. largest Lyapunov exponents (LLEs) in nonlinear data analysis and psychometric measures of limbic irritability (LSCL-33) and depression (BDI-II) in 40 patients with unipolar depression and 40 healthy controls were used.

Result: Significant correlation r=0.69 (p<0.01) between LLEs and LSCL-33 found in this study indicate that degree of chaos in autonomic responses during conflicting Stroop task reflected by LLEs is closely related to limbic irritability. Significant correlation r=0.48 (p<0.01) also has been found between LLEs and symptoms of depression assessed by BDI-II. In the healthy control group similar correlations have not been found.

Conclusion: The results are in agreement with findings that epileptiform activity represents typical form of chaotic organization. Because limbic irritability is linked to seizure-like processes in the tempo-limbic structures, the correlation between LSCL-33 and LLEs might represent useful finding for understanding of neurobiological mechanisms underlying stress-related sensitization and could be useful for future research regarding anticonvulsant treatment of depression.
CHAOTIC NEURAL RESPONSE DURING CONFLICTING STROOP TASK REFLECTS THE LEVEL OF SERUM CORTISOL IN PATIENTS WITH UNIPOLAR DEPRESSION

INSTITUTIONS
1. Charles University, First Faculty of Medicine, Department of Psychiatry, Prague, Czech Republic

AUTHORS
1. Marek Susta

Purpose: According to recent findings detecting a cognitive conflict is related to activation of anterior cingulate cortex (ACC) and central autonomic network. Several recent findings also suggest the hypothesis that the cognitive conflict is related to specific nonlinear chaotic changes of the neural signal. This conflict related activation elicits autonomic responses which can be assessed by psychophysiological measures such as heart rate variability calculated as beat to beat R-R intervals (RRI).

Method: The present study used stroop word-colour test as an experimental approach to psychophysiological study of cognitive conflict in connection with RRI measurement, assessment of serum cortisol and calculation of largest Lyapunov exponents in nonlinear data analysis of RRI time series in 30 patients with unipolar depression.

Result: Significant correlation -0.45 (p<0.01) between largest Lyapunov exponents during conflicting stroop task and serum cortisol levels has been found.

Conclusion: The study indicates that a defect of neural inhibition during conflicting stroop task is closely related to decreased serum cortisol levels which probably reflect defense psychological mechanisms.

NEUROENDOCRINE RESPONSE TO TRAUMATIC DISSOCIATION IN PATIENTS WITH UNIPOLAR DEPRESSION

INSTITUTIONS
1. St Elisabeth University College of Health and Social Work, Department of Psychology, Bratislava, Slovakia

AUTHORS
1. Peter Fedor-Freybergh

Purpose: Dissociation is traditionally attributed to trauma and other psychological stress that are linked to dissociated traumatic memories. Although recent studies regarding the neuroendocrinology of traumatic dissociation are rare, they suggest possible dysregulation of the hypothalamus-pituitary-adrenal (HPA) axis. The aim of the present study is to perform examination of HPA axis functioning indexed by basal prolactin and cortisol and test their relationship to psychic and somatoform dissociative symptoms.

Method: In clinical and laboratory study of 40 consecutive inpatients with diagnosis of unipolar depression (mean age 43.37, SD=12.21) assessment of psychic and somatoform dissociation (DES, SDQ-20), depressive symptoms (BDI-II) and basal serum prolactin and cortisol was performed.

Result: Data show that prolactin and cortisol as indices of HPA axis functioning manifest significant relationship to dissociative symptoms. Main results represent highly significant correlations between psychic dissociative symptoms (DES) and serum prolactin (r=0.55, p=0.0001), and relationship between somatoform dissociation (SDQ-20) and serum cortisol (r=-0.38, p=0.008).

Conclusion: These results indicate relationship between HPA-axis reactivity and psychosocial stress as a function of dissociative symptoms in unipolar depressive patients that could reflect passive coping behavior and disengagement.
SAARC NATION YOUNG PSYCHIATRISTS - PRESENT SCENARIO AND FUTURE HOPES

INSTITUTIONS

4. Noor Ahmed Giasuddin, sadi20022003@yahoo.com
5. Kapila Ranasinghe, kapila_ranasinghe@hotmail.com

The South Asian Association for regional co-operation (SAARC) comprises of Bangladesh, Bhutan, Nepal, India, Maldives, Pakistan, Sri Lanka and Afghanistan. This region belongs to a low income group and accounts for one-fourth of the world’s population and one-fifth of its psychiatrically ill patients. It lacks mental health policies and infrastructure. In recent years the focus has been on community care, trained manpower, patient satisfaction and better legislation. The symposium has been planned to bring forward the “existing” problems along with the needs and demands of the young psychiatrists from these regions.

Each of the speakers is in the process of generating indigenous fact based data from his/her respective country. The target areas include academic and professional needs of the young psychiatrists, awareness related to treatment, assessment tools, research, prescription practices, awareness about the concept of “young psychiatrists”, global organization’s: their benefits and the need for such networks.

An attempt is being made to generate information regarding the activities taken over by the young psychiatrists and trainees in the region in order to update themselves. A critical analysis of what they feel is lacking in the region, the reasons for them contemplating migration, if at all, will also be made. This exercise would help us better understand the status of young psychiatrists from these regions, which would help develop a network of people working toward innovative care models and research collaborations.

SAARC YOUNG PSYCHIATRISTS - PRESENT SCENARIO & FUTURE HOPES: AN INDIAN PERSPECTIVE

INSTITUTIONS
1. SAARC-AyPT, Dept of Behavioral Sciences and Mental Health, Sahyadri Specialty Hospital, Pune, India

AUTHORS
1. Ashutosh Chauhan, Dr, ashutoshchauhan@hotmail.com

Aims and Objectives: This is in keeping with the aims and objectives of the symposium; this particular segment aims to highlight the facts and figures from the existing body of literature pertaining to the state of mental health and related services with special reference to the young psychiatrist in India.

Methodology: The symposium is based on facts and figures generated by the review of literature from the relevant journals and national census reports. This would be clubbed with the more recent data generated by the group’s questionnaire. The questionnaire has been circulated to all the young psychiatrists associated, affiliated and aware about the organization as well as the centers and institutes training individuals in psychiatry.

Results: India has one of the largest number of doctors in training i.e. 27,000 entering medical schools every year. There are in total 4000 psychiatrists. Given the population it translates into 0.4 psychiatrist/1 million population, 0.25 psychiatry beds per 10,000 population. There are an estimated 1,02,70,165 individuals with severe psychiatric illness and 5,12,51,625 individuals with common psychiatric illnesses. At the time of submission of this abstract there are around 300 psychiatry postgraduate seats open every year.

Conclusion: There has been an increase in the number of medical graduates taking up psychiatry in India. Given the needs and demands of the region a move to generate data and subsequent aim to form a comprehensive network of young psychiatrists for the region is deemed essential.
SAARC YOUNG PSYCHIATRISTS - PRESENT SCENARIO & FUTURE HOPES: A PERSPECTIVE FROM PAKISTAN AND OTHER SAARC NATIONS

INSTITUTIONS
1. SAARC-AYPT, Other SAARC nations, India

AUTHORS
1. Ruksheda Syeda1, Dr, MD

Aims and Objectives: To highlight the facts and figures pertaining to the state of mental health in Pakistan, Afghanistan, Maldives and Bhutan. A special impetus has been given to the state of Young psychiatrists from these countries.

Methodology: The symposium is based on facts and figures generated by the local journals and other sources. We have also reviewed the regional meetings of SAARC federation. There is also a prospective study done to collect authentic data addressing the needs and demands of young psychiatrists in the region.

Results: The countries of Afghanistan, Maldives and Burma have less then 10 psychiatrists. There are probably one or two young psychiatrists in Afghanistan. The postgraduate training in psychiatry in Maldives and Burma seems to be missing or abysmal, based on facts reviewed at the time of abstract submission. The census from Pakistan suggests that there are 10,031 medical professionals in total of which there are 300 psychiatrists, 125 psychiatric nurses, 480 psychologists and 600 psychiatric social workers. There are 2940 psychiatric beds in the public sector and 2000 beds in the private sector.

Conclusion: The services are primarily available in urban pockets calling for the need to have a comprehensive network of mental health professionals

SAARC YOUNG PSYCHIATRISTS - PRESENT SCENARIO & FUTURE HOPES: A PERSPECTIVE FROM NEPAL

INSTITUTIONS
1. SAARC-AYPT, Nepal

AUTHORS
1. Shailendra Adhikari1, Dr

Aims and Objectives: To explore the state of mental health and related services in Nepal. This symposium would also highlight findings generated by the questionnaire to tap the needs and demands of young psychiatrists in SAARC nations.

Methodology: The symposium is based on facts and figures generated by the local journals and bodies. Along with the exploration of existing state of psychiatry, this segment of the symposium would also bring forward the needs and demands of young psychiatrists in Nepal based on the self generated questionnaire drafted by the scientific committee of SAARC-AYPT.

Results: Nepal is predominantly a rural country, with only 15% of the population staying in urban areas. The proportion of health budget to GDP is less then 3%, out of which 0.8% is on mental health. There is no national morbidity data generated from the country, 1% of the population suffers from Severe Mental disorders, 10-20% from “milder” mental health problems. There are a total of 200 psychiatry beds in the country. There are a total of 35 psychiatrists for a 25 million population.

Conclusion: Given the number of psychiatrists and the current status of mental health services a greater regional cooperation is the need of hour.
SAARC YOUNG PSYCHIATRISTS - PRESENT SCENARIO & FUTURE HOPES: A PERSPECTIVE FROM BANGLADESH

INSTITUTIONS
1. SAARC-AYPT, Bangladesh

AUTHORS
1. Noor Giasuddin, Dr

Aims and Objectives: To highlight the facts and figures pertaining to the state of mental health in Bangladesh, this is an off-shoot of the primary study and symposium organized by the SAARC nations association of Young Psychiatrists and Trainees (SAARC-AYPT).

Methodology: The symposium is based on facts and figures generated by the local journals and bodies. Along with a detailed outlook about the existing state of psychiatry, this segment of the symposium would also bring forward the needs and demands of young psychiatrists in Bangladesh based on the self generated questionnaire drafted by SAARC-AYPT.

Results: The proportion of health budget to GDP is 3.55%, out of which 0.5% is on mental. The total number of psychiatrists per 10,000 population is 0.065. The number of psychiatrists per 100,000 population is 0.05. Bangladesh has created 82 psychiatrists in the last 50 years.

Conclusion: There is an urgent need to organize mental health services network in Bangladesh in liaison with other SAARC nations.

SAARC YOUNG PSYCHIATRISTS - PRESENT SCENARIO & FUTURE HOPES: A PERSPECTIVE FROM SRI LANKA

INSTITUTIONS
1. SAARC-AYPT, Sri Lanka

AUTHORS
1. Kapila Ranasinghe, Dr

Aims and Objectives: To highlight the facts and figures pertaining to the state of mental health care in Sri-Lanka. This is an off-shoot of the primary study and symposium organized by the SAARC nations association of Young Psychiatrists and Trainees (SAARC-AYPT).

Methodology: The symposium is based on facts and figures generated by the local journals and bodies. Along with this, figures generated by the national chapter as a part of broad study conducted by SAARC-AYPT would also be presented.

Results: The country has more psychiatrists of Sri-Lankan origin out of the country, than in the country. The country has 3000 psychiatric beds, 38 psychiatrists, 2 child psychiatrists, 100 psychiatric nurses. The country spends 1% of its health budget on mental health services. The country also has district medical officers (trained in psychiatry). At present there are 93 post graduate trainees, out of which 25 are senior registrars.

Conclusion: There is an urgent need to organize mental health services network in the region.

2. Jiri Raboch

Most recent years have shown an increase of research on coercive treatment across Europe. Contributions of this symposium will provide an update of (preliminary) results from the EUNOMIA-project, an EC-funded mental health services research project carried out in 13 catchment areas in 12 European countries (more than 3,400 patients included). Attendants of the symposium will learn about an important research activity in the field of coercive treatment; further, their interest in a human rights field of treatment with major ethical challenges should be stimulated.

PREDICTORS OF INVOLUNTARY HOSPITAL ADMISSION ACROSS THE EUNOMIA STUDY SITES

INSTITUTIONS
1. Park Hospital, Psychiatry, Psychosomatic Medicine and Psychotherapy, Leipzig, Germany

AUTHORS
1. Thomas W Kallert1, Prof. Dr., Thomas.Kallert@parkkrankenhaus-leipzig.de

Background
Previous research has shown a specific profile of risk factors characterizing patients who are legally involuntarily admitted to psychiatric hospitals: younger age, diagnosis of psychotic disorder and/or mental retardation, manic symptoms, and male gender and/or non-Caucasian ethnicity.

Methods
The naturalistic and epidemiologically oriented EUNOMIA-study design in 13 sites in 12 European countries used a standardized battery of instruments (e.g. psychopathology, legal status, perceived coercion, satisfaction with treatment) to assess two groups of patients: legally involuntarily admitted patients and legally voluntarily admitted patients who feel coerced to admission. Uni- and multivariate analyses on the data are performed, and a logit-model for predicting involuntary hospital admission was developed.

Results
This presentation is based on 2,586 legally involuntary and 830 legally voluntary patients included in the study. General and site-specific differences between the two subgroups of patients focusing on the initial assessment within the first week after hospital admission covering their socio-demographic and clinical characteristics, legal status, perceived coercion and satisfaction with treatment will be highlighted. Further, details of the statistical model predicting involuntary admission will be demonstrated.

Conclusions
Consequences for clinical practice of involuntary hospital admissions across Europe will be demonstrated.
COMPARISON OF THE CLINICAL USE OF COERCIVE MEASURES DURING HOSPITALISATION ACROSS THE EUNOMIA STUDY SITES

INSTITUTIONS
1. Charles University, Psychiatric Department, Prague 2, Czech Republic
2. EUNOMIA study team, Germany

AUTHORS
1. Jiří Raboch, Prof./Mr., Md, raboch@cesnet.cz

Detailed data concerning individual coercive measures - 1) physical restraints, 2) the use of seclusion and 3) forced medication were gathered using a special form designed by the EUNOMIA group in 11 centres from 10 countries. In the group of 2 587 involuntarily admitted patients (average age: 38,2±11,1) coercive measures were used in 32,2% of them (in 55% of men and 45 % of women). The frequency of the use of coercive measures in individual centres varied substantially between 9,1% in Slovakia and 59,2% in . In the majority of patients more than one coercive measure was applied. In 9 centres the most frequent measure used was forced medication (mainly typical antipsychotics and benzodiazepines) and in 4 centres physical restraint. Seclusion was available in 6 countries and not very frequently used. The main reason for application of coercive measures was aggression against others. Coercive measures were usually ordered by a psychiatrist. In majority of countries only members of medical staff were present at the time of their application; but in some countries relatives, police and others were also involved. In all countries patients were informed about reasons, duration and form of the measure. Coercive measures are used in the group of involuntarily admitted patients in all countries participating in the EUNOMIA project. Differences in the type and frequency of their application reflect largely different cultural traditions, different legal systems and various structure and quality of mental health care.

CLINICAL AND SOCIODEMOGRAPHIC FACTORS INFLUENCING THE USE OF COERCIVE MEASURES DURING HOSPITALIZATION

INSTITUTIONS
1. Psychiatric Department of the 1st Faculty of Medicine, Charles University, Prague, Czech Republic, Czech Republic

AUTHORS
1. Lucie Kalisova

Aims
To find out whether some clinical and/or sociodemographic characteristics may play a role in the use of coercive measures during hospitalization. Presentation of results from the EUNOMIA international project.

Methods
Basic sociodemographic data were obtained using a questionnaire created by the EUNOMIA group. Psychopathology was assessed using the 24-items Brief Psychiatric Rating Scale within the first week of hospitalization. Total group of involuntary admitted mentally ill patients from 10 European countries was divided into two subgroups - „group 1” included patients which had some coercive measure applied, second subgroup („group 0”) patients with no coercive measures applied. Statistical methods - T test, Chi-quadrat, Mann-Whitney test.

Results
We followed the total sample of 2030 patients. 39% women and 37,5 % men from the total group had some coercive measures applied during first 4 weeks of hospitalization. Group 1 - N =770, average age 38,1 (SD 11,1); men 57%; women 43%;
Group 0 - N= 1260, average age 38,8 (SD 11,3), men 55%; women 45%.
From diagnostic point of view, there was higher percentage representation of patients with F2.x.x (ICD 10) in the group 1. BPRS showed significantly higher scores (< 0,01) mainly in items hostility, unusual thought content and bizarre behavior in the group 1.

Conclusion
Factors connected with psychopathology play probably more important role than sociodemographic characteristics in the use of coercive measures in the group acutely mentally ill patients.
PERCEIVED COERCION AT ADMISSION - A CROSS-NATIONAL ANALYSIS

INSTITUTIONS
1. School of Health and Medical Sciences, Psychiatric Research Centre, Örebro, Sweden

AUTHORS
1. Lars Kjellin, Dr, PhD, lars.kjellin@orebro.se

Objectives
To compare levels of perceived coercion at admission among legally involuntarily and voluntarily admitted patients, and patients’ perceptions of coercion at admission assessed by staff, across the EU-NOMIA study sites.

Methods
More than 4500 legally voluntarily admitted patients in 13 psychiatric services in twelve European countries were screened for perceived coercion at admission according to the Macarthur Perceived Coercion Scale (MPCS). Patients in this way identified as legally voluntarily admitted patients who felt coerced to admission, and consecutively legally involuntarily admitted patients, in all more than 3400 patients, were interviewed and assessed within a week from admission. Coercion, as perceived by patients, was assessed by the MPCS and the Coercion Ladder (CL). The staff assessed on the CL the amount of pressure they thought the patients experienced at admission.

Results
The proportion of legally voluntarily admitted patients who felt coerced to admission according to the MPCS ranged from 15 to 38% across the centres. For the legally involuntarily admitted patients, the proportion scoring high on the CL ranged from 53 to 98%. The patient and staff scorings on the CL were positively correlated ($r=0.408$), but on the average patients scored higher than the staff (mean difference 1.8, range 0.2-3.6 across centres).

Conclusion
There was a considerable variation in levels of perceived coercion at admission across the study sites among legally voluntarily as well as legally involuntarily admitted patients. The staff assessed the admissions as less coercive than the patients themselves.

QUALITY OF LIFE AND SOCIAL FUNCTIONING OF INVOLUNTARILY ADMITTED PATIENTS - THE EU-NOMIA STUDY.

INSTITUTIONS
1. Wroclaw Medical University, Department of Psychiatry, Wroclaw, Poland

AUTHORS
1. Andrzej Kiejna, Prof., PhD, akiejna@psych.am.wroc.pl
2. Joanna Rymaszewska, Dr., PhD, ankarym@psych.am.wroc.pl

Objective:
evaluate quality of life and social functioning of psychiatric patients admitted legally involuntarily and voluntarily but felt coerced.

Method:
Involuntarily admitted patients (n=823) and voluntarily who felt coerced based on MacArthur Admission Experience Survey (n=286) from 8 European centers were assessed at 3 time-points: at admission, 4 and 12 weeks after admission. The Short Assessment of Quality of Life (MANSA) and Global Social Functioning (GAF) were used. Several further factors were analysed by regression models: psychopathology (Brief Psychiatric Rating Scale), Cantril Ladder of Perceived Coercion, level of aggression by Modified Overt Aggression Scale (MOAS) and Client's Assessment of Treatment (CAT).

Results:
28% involuntarily patients were employed, 32% pensioned (28%, 41% respectively in voluntary group). There were no differences in sex, age, education or duration of disorder in both groups. Higher QoL was associated with better social functioning, being employed, married, having manic/excitement symptoms, involun-

tarily admission and higher verbal and physical aggression. Overall psychopathology, autoagression as well as diagnosis of depression and personality disorders were negatively correlated with QoL. In forward-backward stepwise selection model depressive symptoms, being unemployed or pensioned, living in Prague or Wroclaw and feeling coerced during voluntary admission predicted lower QoL in each measure point, whereas social functioning and satisfaction of treatment, manic symptoms, living in Vilnus, Orebro or London predict higher QoL.

Conclusions:
Subjective feeling of being coerced during psychiatric admission predict lower quality of life even after 3 months of treatment.

TRANSFORMING PSYCHIATRIC SERVICES TO BETTER RESPOND TO EMERGING NEEDS: THREE INITIATIVES FROM CANADA

INSTITUTIONS
1. Douglas Institute, Psychiatry, Montréal, Canada
2. McGill University, Psychiatry, Montréal, Canada

AUTHORS
1. Michel Perreault\textsuperscript{1,2}, Dr, PhD, michel.perreault@douglas.mcgill.ca
2. Myra Piat\textsuperscript{1,2}, Dr, Ph, myra.piat@douglas.mcgill.ca
3. Marie-Josée Fleury\textsuperscript{1,2}, Dr, PhD, marie-josee.fleury@douglas.mcgill.ca

Statement of the problem: A number of challenges have to be faced in the organization and delivery of contemporary psychiatric services. Among the most common difficulties encountered is the need to: (1) better integrate services, (2) develop services which address multiple diagnoses and (3) orient existing services according to a recovery approach.

Aim of the symposium: To present three distinct initiatives currently being implemented in Montréal, CANADA aimed at transforming existing psychiatric services in order to improve the mental health system.

Methods: Presentation of innovative projects involving managers and clinicians and consumers. Dr Marie-Josée Fleury will present the role of general practitioners (GPs) within mental health in the context of current reforms aiming at increasing primary care and the integration of healthcare systems. Dr Myra Piat will describe the recovery paradigm, and the transition from a traditional model of service delivery to a recovery oriented one through the implementation of a training program for multidisciplinary teams. Dr Michel Perreault will present the results of a “Cross-Training” program which began in 2003 and is aimed at facilitating communication and knowledge exchange among mental health professionals on dual diagnoses treatment.

Learning objectives: Participants will learn more about 1) the role of GPs in mental health, new psychiatric service integration models and how to improve linkages between primary care and specialized services, 2) the recovery approach and its implementation through staff training, and 3) the different models of a “cross-training” approach and its application for persons with dual-diagnoses.

DETERMINANTS OF GPS TAKING CARE OF PATIENTS WITH COMMON MENTAL DISORDERS

INSTITUTIONS
1. Douglas Research Centre, Psychiatry, Montreal, Canada
2. University Institute of Mental Health Douglas, Psychiatry, Montreal, Canada
3. McGill University, Division Psychosocial, Montreal, Canada

AUTHORS
1. Marie-Josée Fleury\textsuperscript{3}, Dr, PhD, flemar@douglas.mcgill.ca
2. Jean-Marie Bamvita\textsuperscript{1}, Mr., MD, jean-marie.bamvita@douglas.mcgill.ca
3. Jacques Tremblay\textsuperscript{2}, Mr, MD, jacques.tremblay@douglas.mcgill.ca

Objectives: This presentation is aimed at assessing factors that determine general practitioners (GPs) taking care of patients suffering from common mental health disorders (CMD).

Methods: The study is based on a sample of 398 GPs; representative of all Quebec’s GPs. GPs had to answer a questionnaire comprising 59 items, related to their healthcare practices. Descriptive, bivariate and multivariate analyses were performed.

Results: GPs’ socio-demographic profile, patients’ characteristics and GPs’ clinical practice, and perceived inter-professional relationships were found to be the essential categories of variables in determining GPs in taking care of CMD patients. The main characteristic of GPs who take charge of CMD patients pertains to their interest in mental diseases. On the contrary, the principal factor which impedes them is related to the positive perception of their relationships with psychiatry teams.

Conclusions: This study demonstrates: (1) that interest and knowledge in dealing with CMD patients, (2) the patient diagnosis profile which should not be too complex, (3) availability of diversified services, and (4) the quality and interest in mental healthcare integration, play a critical role in GPs taking care of patients with CMD. The results sustain the importance of promoting awareness campaigns aimed at increasing GPs’ interest toward taking care of patients with CMD, as well as implementing integrated care models such as shared care. Improving healthcare systems without such campaigns could lead to perverse effects such as the increase of transfer of CMD patients. Reforms should also invest in mental health training, and in improving psychosocial treatments.
IMPLEMENTING RECOVERY ORIENTED PSYCHIATRIC SERVICES IN MONTREAL, CANADA

INSTITUTIONS
1. Douglas Mental Health University Institute, Montreal, Quebec, Canada
2. McGill University, Psychiatry, Montreal, Canada
3. University of Ottawa, Canada
4. Ontario Ministry of Health, Canada
5. Laval University, Canada

AUTHORS
1. Myra Piat 1,2, Dr., Ph.D., myra.piat@douglas.mcgill.ca; 2. Judith Sabetti 1; 3. Audrey Couture 1; 4. John Sylvestre 1; 5. Janos Botschner 1; 6. Helene Provencher 1; 7. David Bloom 1,2, Dr, MD

Statement of problem: Although recovery has become the new guiding vision for the delivery of psychiatric services, there is little consensus on the definition of recovery 1. As well, mental health service providers struggle with how to move from a more traditional medical and rehabilitative model to recovery oriented system 2.

Aim of the study: (1) to provide an overview of the recovery paradigm within a Canadian context, (2) to present a training program for service providers, (3) to present the meaning of recovery from a user perspective. Methods: (1) Descriptive information from 3 pilot projects implemented on the island of Montreal involving 60 mental health service providers and users will be presented. (2) sixty individual interviews were conducted with users on the meaning of recovery.

Results: Fifty nine service providers and users participated in a 2 day training session. Overall satisfaction was directly related to involving users as partners in the training. Consumers defined recovery in terms of two perspectives: in relation to illness and in relation to wellness.

Conclusion: Involving users in the implementation of training around recovery oriented services is essential. Most consumer definitions cut across both perspectives, suggesting that Canadian consumers view recovery as both a medical and psychosocial concept.

A CROSS-TRAINING PROGRAM TO IMPROVE SERVICE INTEGRATION FOR DUAL-DIAGNOSIS PATIENTS OF MONTREAL, CANADA

8. Michel Landry 6, Dr, PhD
9. Jacques Tremblay 7, Dr, MD

Statement of the problem: Treatment for persons with dual diagnoses is frequently characterized by a lack of continuity due to service fragmentation. In Montréal, in order to improve the integration of these services, a cross-training program involving teams from mental health, substance abuse as well as the police services has begun in 2003.

Aim of the study: to evaluate the implementation of the two phases of this program (i.e. one-day staff rotations and one-day training sessions based on case discussions and conferences) from the participants’ perspective. Methods: (a) assessment of staff rotations (72 standardized questionnaires and two focus groups); and (b) assessment of case discussions (149 self-administered questionnaires).

Results: registration to both phases of the program exceeded its capacity: 117 clinicians from 50 different teams participated to the staff rotations between 2003 and 2005 and 273 staff participated to the case discussions in 2007. Staff rotations’ evaluation revealed a high degree of satisfaction among participants. The improvements suggested concern the lack of preparation of some resources and confidentiality of patient information. Some recommend the develop rotations involving longer stays.

Concerning the case discussions, results reveal that participants are highly satisfied with “real” case discussions with colleagues from other teams. They also value the conferences on related topics. They recommend, however, to have smaller groups, of about 8 (instead of 12-13).

Conclusion: by facilitating exchanges between different networks of services, the program appears to fulfill its original aim. To optimize its impact, organizers from different networks should be involved.

OPTIMIZING OUTCOME OF DEPRESSION TREATMENT: SHOULD WE MODIFY TREATMENT ACCORDING TO DEPRESSION CHARACTERISTICS OR COMORBID CONDITIONS?

INSTITUTIONS
1. JellinekMentrum Mental Health Amsterdam, Mentrum Depression Research group, Amsterdam, The Netherlands

AUTHORS
1. Henricus L Van1, MD PhD
2. Robert A Schoevers1, MD PhD
3. Simone Kool1, MD PhD
4. Jack JM Dekker2, Professor, PhD
5. Gerda van Aalst1, MD

Background: Treatment of depression turns out to be less effective than we are inclined to think, especially when remission is taken into account as outcome measure. Both depression characteristics and comorbid conditions may be associated with treatment outcome.

Aims: To examine predictors of success or failure of depression treatment.

Method: Systematic literature search, and secondary analyses of RCT’s effectuated by the JellinekMentrum Depression Research Group Amsterdam.

Results: Both easily identifiable patient and depression characteristics, and comorbid anxiety of personality disorder are associated with outcome of depression treatment. Specific treatment modalities such as combined therapy or SSRI’s may yield better outcome according to depression and comorbidity characteristics.

Conclusion: Future guidelines should specifically address subgroups of depressed patients according to patterns of comorbidity and depression type.

IDENTIFYING PATIENTS AT RISK FOR NONRESPONSE IN DEPRESSION TREATMENT

INSTITUTIONS
1. JellinekMentrum Mental Health Amsterdam, Mentrum Depression Research Group, Amsterdam, The Netherlands

AUTHORS
1. Henricus L Van1, MD PhD, rien.van@mentrum.nl
2. Robert A Schoevers1, MD PhD, robert.schoevers@mentrum.nl
3. Jaap Peen1, PhD, jaap.peen@mentrum.nl
4. Jack JM Dekker1, Professor, PhD, jack.dekker@mentrum.nl

Background: The principal aim of depression treatment is to achieve remission. However, many patients do only partly respond and literature indicates that about a third of the patients do not respond at all to treatment. We will present a study to determine the frequency and predictors of complete nonresponse in different treatments for depression.

Method: Post hoc analysis of the pooled data of three consecutive RCTs of outpatient depression treatment. 313 patients with major depressive disorder and HAM-D-17 scores between 14 and 25 were treated for six months with either pharmacotherapy, Short-Term Psychodynamic Supportive Psychotherapy or combined therapy. Complete nonresponse was defined as less than 25 % response according to the HAM-D-17. Sociodemographic factors, depression features and adherence were investigated as predictors in a multivariate stepwise logistic regression analysis.

Results: Overall, nonresponse occurred in 34% of the patients. In pharmacotherapy this was 46%, in psychotherapy 39% and in combined therapy the percentage was 28%. Severity of somatic symptoms was associated with nonresponse in both combined therapy and psychotherapy. In psychotherapy nonresponse was related to age above 40, chronic depression and non-adherence by the patient. In the case of combined therapy younger age, previous use of an antidepressant and having a first depressive episode were associated with nonresponse.

Conclusion: Easily measurable patient characteristics may help to identify patients at risk for complete nonresponse to treatment. It is suggested that predictors may differ across treatment modalities. However, head-to-head comparisons are required when selecting the most appropriate treatment for specific depressed patients.
MANAGING DEPRESSION WITH COMORBID ANXIETY DISORDER

INSTITUTIONS
1. JellinekMentrum Mental Health Amsterdam, Mentrum Depression Research Group, Amsterdam, The Netherlands

AUTHORS
1. Robert A Schoevers1, MD PhD, robert.schoevers@mentrum.nl
2. Henricus L Van1, MD PhD, rien.van@mentrum.nl
3. Vincent Koppelmans3, MA
4. Simone Kool1, MD PhD, simone.kool@mentrum.nl
5. Jack JM Dekker1, Professor, PhD, jack.dekker@mentrum.nl

Background: Depression and anxiety disorders frequently co-occur, with comorbidity indicating higher severity and treatment resistance. Still, current treatment protocols often address single disorders.

Aim: To present an overview of the literature on treatment of combined disorders.

Method: Systematic literature search for RCT’s in Medline, Embase, Psychlit from 2000

Results: Most research concerns so-called ‘anxious depression’, defined as a major depression with anxiety symptoms not meeting criteria for a specific anxiety disorder. 11 RCT’s found a difference in efficacy between depression with and without comorbid anxiety; 3 studies did not find a difference. SSRI’s may be more effective in anxious depression. Only 2 studies concerned psychotherapy.

Conclusion: Differing operationalisations of anxious depression complicate practical application of these findings. Available studies show significant variation in design and measurement instruments. Systematic screening for comorbidity should be a part of treatment studies in depression. Research on treatment efficacy in diagnosed comorbidity is urgently needed.

PREDICTORS FOR THE RESULT OF TREATMENT OF DEPRESSIVE AND COMORBID PERSONALITY DISORDER

INSTITUTIONS
1. JellinekMentrum Mental Health Amsterdam, Mentrum Depression Research Group, Amsterdam, The Netherlands

AUTHORS
1. Simone Kool1, MD, PhD, simone.kool@mentrum.nl
2. Robert A Schoevers1, MD, PhD, robert.schoevers@mentrum.nl
3. Jack JM Dekker1, Professor, PhD, jack.dekker@mentrum.nl

Background: Comorbidity of depressive and personality disorder frequently occurs in daily practice; around two third of the depressed patients also suffers from one or even several types of personality pathology. Also, in this extra vulnerable group of patients the depression gets less frequently into remission, and chronicity and recurrence develop more often. These findings emphasize the importance of finding predictors for the outcome of treatment, both positive and negative.

Aim: To offer an overview of positive and negative predictors for the result of different types of treatment of depressive disorder with comorbid personality disorder.

Method: Systematic review of the literature concerning this subject; also an overview will be given of these predictors in the different types of treatment.

Results: Based on the findings both in literature and in clinical research, robust predictors for the success of different treatment modalities will be presented.

Conclusion: In the prevention of failure in the treatment of comorbid depressive and personality disorder, predictors can be taken into account in the different types of treatment. The chance of chronicity and recurrence of the diseases can thus be diminished.
RISK FACTORS TO RELAPSE AND/OR A NEW DEPRESSIVE EPISODE?

INSTITUTIONS
1. JellinekMentrum Mental Health Amsterdam, JellinekMentrum Depression Research Group, Amsterdam, The Netherlands

AUTHORS
1. Jack JM Dekker¹, Professor, PhD, jack.dekker@mentrum.nl
2. Jurrijn Koelen¹, MA, jurrijn.koelen@mentrum.nl
3. Jaap Peen¹, PhD, jaap.peen@mentrum.nl
4. Pieter Molenaar¹, MA, pieter.molenaar@mentrum.nl

Background: Long term effects of treatment for depression do not seem to be bright, varying from 50% till 60-70% relapses and/or new depressive episodes. Once one has already experienced a second episode, this percentage could rise to 80 or 90%.

Aim: Aim of this mega-analysis is to determine the long term effectiveness of a treatment for depression and to determine the probable risk factors of a relapse/new episode.

Method: This mega-analysis concerned the original data of three published randomized clinical trials. Ambulatory psychiatric patients with a depression were treated with pharmacotherapy, psychotherapy or combined treatment. The research question is what are the longer term effects of these treatments were after 0.5 year (all three of the trials), 1 year and 1.5 years (two trials) after finishing the acute 6-month treatment.

Results: For now, the relapse percentage during the continuation episode seems to be 20 to 25% (during a period of half-a-year after finishing the acute treatment). About one third of the patients group seems to have a chronic course. Gender (women show less effectiveness) and remnant symptoms at the end of acute treatment, were predictors of remaining recovery.

Conclusion: Long term results of treatment for depression are not promising. The extensiveness of this disease is more than we have expected. One of the most important predictor seems to be the effective result of acute treatment: the better the one is, the longer the duration of recovery.

DROPOUT; A NEGLECTED CAUSE OF NON-RESPONSE

INSTITUTIONS
1. JellinekMentrum Mental Health Amsterdam, Mentrum Depression Research Group, Amsterdam, The Netherlands

AUTHORS
1. Gerda van Aalst¹, MD, gerda.van.aalst@mentrum.nl
2. Robert A Schoevers¹, MD PhD
3. Jaap Peen¹, PhD
4. Jack JM Dekker¹, Professor, PhD

Background: The efficacy of treatment with antidepressant medication is severely compromised by high dropout rates. Combined therapy (pharmacotherapy and psychotherapy) often yields higher adherence rates than pharmacotherapy alone. The reasons for this association are unknown.

Aim: To determine whether time to dropout, reasons for dropout and response to treatment differ between depressed outpatients treated with antidepressant monotherapy or combined therapy.

Results: Treatment with combined therapy significantly reduces dropout rates compared to treatment with monotherapy from week 16 to week 24. Reasons for dropout differed between both treatment conditions. At 24 weeks, the main reason for monotherapy dropout was “side-effects” (mean HDRS 15). However, the main dropout reason was “feeling better” (mean HDRS 7) for those patients treated with combined therapy.

Conclusion: Available studies on dropout, whether monotherapy or combined therapy, often relate premature termination to side-effects. However, in this study, the main reason for dropout in patients treated with combined therapy was “feeling better” and the depression was in full remission. On the other hand, the main reason for dropout in patients treated with monotherapy was “side effects”, those patients were still depressed. Further studies with a treatment duration of at least 12-16 weeks are needed to confirm these results.

4. Sanat K Roy⁴, Chief of Psychiatry, MD

Background: Efficacy and safety of ECT has long been established among others conditions for severe depression, mania and certain types of schizophrenia. However safety concern remain for certain complex and co-morbid clinical conditions such as patient in late gestation, patients with intracranial lesions or history of pulmonary embolisms or certain cardiac illnesses. Recent advances in the technique of treatment with close electrophysiological monitoring, close clinical supervision, availability of medications to mitigate physiological effects and advances in technology as to delivery of current (brief pulse wave), comprehensive pre ECT work up, evidenced based diagnosis selection criteria have significantly improved safety and outcome.

Aim: Presenters of this symposium aim to illustrate safety related considerations in treating treatment resistant psychiatric disorders associated with complex and challenging comorbid medical conditions.

Method: Authors will share and discuss information related to safe administration of ECT in various complex clinical conditions, using various precautions like setting of treatment, close monitoring of various physiological parameters before, during and after the treatment.

Conclusion: Using appropriate measures ECT can be administered in a safe and effective manner in complex clinical conditions (1, 2)

ECT DURING THIRD TRIMESTER OF PREGNANCY

INSTITUTIONS

AUTHORS
1. Subhash C Bhatia¹, Dr., MD, sub55@cox.net
2. Shashi K Bhatia², Dr., MD, sub55@cox.net

The management of severe depression during late stage of pregnancy presents a challenge for clinicians. Antidepressants may have impact on the birthing process or the health of the neonate. In addition psychotherapy may not be effective intervention for psychotic depression. The treatment may require close supervision, availability of tocolytic therapy, monitoring of the cardiac status of the fetus before and during uterine contraction. During and after ECT no negative impact was seen in umbilical blood flow. None of our patients had ECT related complications. To guard against any ECT related potential complication the treatments should be administered in labor and delivery room under the supervision of the obstetrician with proper monitoring of mother and fetus.

CONCURRENT ADMINISTRATION OF ECT AND CLOZAPINE IN TREATMENT-RESISTANT SCHIZOPHRENIA

We are often faced with patients who continue to experience positive and negative symptoms of schizophrenia with conventional and atypical antipsychotics. We treated a patient who failed to respond to conventional antipsychotics, including Pemozide and ECT and atypical antipsychotic pharmacotherapy including clozapine alone. These interventions were also with adjunctive pharmacotherapy. We treated this patient with 850mg/day with clozapine with limited response. However concurrent treatment with clozapine and ECT resulted in substantial improvement with drop in Brief Psychiatric Rating Scale Score from 69 to 37. There was no prolongation of seizure activity with ECT. However 20 months post discharge while on clozapine patient experienced a grandmal seizure unrelated to ECT and was switched to olanzapine without loosing effectiveness. Combined ECT and Clozapine Therapy interventions may be considered in treatment-resistant schizophrenia.

ECT IN PATIENTS ON LONG-TERM WARFARIN THERAPY

Hemodynamic changes during and after ECT e.g. elevation of blood pressure may cause intracranial hemorrhage in patients with intracerebral aneurysm. We successfully treated a patient with a diagnosis of major depression and history of ruptured cerebral aneurysm with cerebral hemorrhage. Following hemorrhage patient had the repair of aneurysm and had placement of ventriculoperitoneal shunt. In this patient the ECT was administered using propofol anesthesia and coverage with 25-50 mg of esmolol. There were no ECT related vascular complications.

AUTHORS
1. Zoltán Rihmer², Dr, MD; rihtemer.z@kronet.hu
2. André Francois Joubert¹, Dr, MD MMed DMed(Psych), anjo@lundbeck.com

About 66% of suicide victims have current major depression, of which 50% contact health-care services during the last 4 weeks of their life. Yet over 80% of depressed suicides are untreated or inadequately treated. Several large-scale, naturalistic, observational follow-up studies demonstrate successful treatment of major depression with antidepressants, and bipolar disorders with mood stabilizers, antidepressants and/or antipsychotics, markedly reduce suicide risk and completed suicide. Suicidal behaviour in patients taking antidepressants is most frequent in the first 10-14 days of treatment, while cohort studies found that continuous treatment substantially reduced subsequent suicidal behaviour risk.

The marked decline of suicide rates in countries where antidepressant utilization increased by three-to-eighthfold also supports the anti-suicidal effect of antidepressants. However, meta-analyses of randomized antidepressant trials in major depression (with severe, acutely suicidal patient exclusion) show a nonsignificant increase of suicidal behaviour in patients taking antidepressants compared to placebo. This relatively small increase in suicidality relates to depression-worsening potential of antidepressant monotherapy (unprotected by mood stabilizers) in subthreshold bipolar depressives (in trials on unipolar depression) and in unrecognized bipolar depressives (in real-life). The suicide rate of untreated major depressives is 25-30 fold times higher than in the general population, but patients taking antidepressants show „only“ 8-fold increase in this risk. Widespread use of SSRIs appears to have caused a marked decline in suicide rates in many countries. The consequences of the FDA black box warnings are now becoming evident, and cannot be underestimated nor ignored.

In psychosis, external world is given an incomprehensible interpretation, which also leads to distorted interpersonal relationship. Early traumas, certain personality features and developmental deviances increase vulnerability to psychotic experiences and manifest psychosis. The symposium describes the concept of incomprehensibility and manifestation of psychotic experience within interpersonal relationships. The symposium also shows how early developmental deviances, childhood traumas and alexithymic features associate with vulnerability to psychosis in adulthood.

INCOMPREHENSIBILITY: THE ROLE OF THE CONCEPT IN DESCRIBING PSYCHOPATHOLOGY

INSTITUTIONS
1. University of Turku, Department of psychiatry, Turku, Finland

AUTHORS
1. Markus Heinimaa¹, Dr., MD, MA, mahheini@utu.fi

The question on the role of „incomprehensibility“ in psychiatry has a long history at the margins of psychiatric discourse. Jaspers’ work is the most important exemplification of this query, but recently the whole issue has been in eclipse. The notion of „incomprehensibility“ has, however, inherent conceptual connections to key psychiatric concepts (like „psychosis“, „delusion“, „insight“, „understanding“).

Jaspers’ well-known and controversial thesis was that incomprehensibility is the defining feature of schizophrenic process. The negativistic implications of this thesis lead to its demise and obfuscation of this conceptual issue altogether. Taking incomprehensibility as an empirical fact stems from a misunderstanding of its grammar but this should not lead us to disregard its role as a concept constitutive for the domain of psychiatry.

Applying these insights into the area of early detection and intervention of psychosis, we recognize that understanding the intrinsic rationale of the field is difficult without appealing to the concept of incomprehensibility. Yet we are also led astray if we try to formulate relevant symptom definitions on this basis. Consequences thereof for recent developments in the field are delineated.
EXPERIENCED POOR ATTITUDE FROM OTHERS - EARLY SIGN OF RISK OF PSYCHOSIS: RESULTS OF THE EPOS STUDY

Aims: Risk of psychosis is defined by occurrence of positive psychotic-like symptoms or by decreased functioning with familial risk of psychosis. We studied how reported functioning of psychiatric outpatients associates with vulnerability to and risk of psychosis.

Methods: Altogether 790 patients of age 13 to 36 years attending psychiatric outpatient care fulfilled the prod screen including seven items of functioning. Vulnerability to psychosis was assessed by specific symptoms of the prod screen and current risk of psychosis by occurrence of basic symptoms, attenuated psychotic symptoms, brief, limited or intermittent psychotic symptoms or familial risk plus reduced functioning during the past three months. Patients with current risk of psychosis were followed for 18 months and transition to psychosis was detected.

Results: In all, 219 patients vulnerable to and 55 patients at current risk of psychosis were detected. Six risk patients became psychotic during the follow-up period. Vulnerability to psychosis associated significantly with all items of functioning. Current risk of and transition to psychosis associated significantly only with subjectively experienced “poor attitude from others”. Experienced “poor attitude from others” associated also significantly also with prod screen specific symptoms.

Conclusion: Subjectively experienced “poor attitude from others” seems to be early sign of risk of psychosis.

SOCIAL AND PRENATAL PREDICTORS OF PSYCHOTIC EXPERIENCE DURING THE POSTPARTUM PERIOD

Aims: Psychotic illness following childbirth is a relatively rare but severe condition with unexplained etiology.

Methods: We investigated incidence rates and potential maternal and obstetric risk factors of psychoses after childbirth in a national cohort of first-time mothers from 1983 through 2000 (n=745,596).

Results: The incidence of psychiatric hospitalisations for a postpartum psychotic or bipolar episode among women without previous psychiatric hospitalisations was 0.04 and 0.01 percent of first births, respectively, while among women with any psychiatric hospitalisation prior to delivery, the incidence was 9.2% and 4.5%, respectively. The risk increased significantly with recency of pre-pregnancy hospitalisations, number of prior hospitalizations, and length of most recent hospitalization. The incidence of psychotic illness peaked immediately following a first childbirth and 49 percent of the cases were women without any previous psychiatric hospitalization. Among women without any previous psychiatric hospitalization, higher maternal age and low birth weight of the infant were associated with increased risk of psychoses distinctly during the postpartum period, while maternal diabetes and high birth weight of the infant appear to decrease the risk. Low level of education, not cohabitating with the infant’s father and maternal smoking had impact on the risk of psychoses after the first 90 days postpartum among all women as well as among women without any previous psychiatric hospitalization. The increased risk of psychoses among immigrant women was amplified after the first 90 days postpartum.

Conclusions: These findings have implications for the etiology of psychotic illness occurring in the immediate postpartum period.
EARLY TRAUMA AS A RISK FACTOR FOR PSYCHOSIS - EVIDENCE FROM THE RADEP AND EPOS STUDIES

Objectives: To further evaluate the possible impact of childhood interpersonal trauma and distress as a risk factor for the development of psychosis in various clinical samples with a newly developed instrument, the Trauma and Distress Scale (TADS).

Methods: A first version of the TADS, a 43-item self-rating questionnaire, was administered to samples of subjects attending primary care and community mental care (RADEP study, n = 742 and n = 178), and at high risk for psychosis (EPOS, n = 240). On this basis, an early trauma sum score and scores for trauma and distress subcategories as emotional, physical and sexual abuse, as well as emotional and physical neglect were calculated. Associations with indicators of special and general psychopathology, and for the EPOS sample also transition into psychosis, among others, were determined.

Results: Remarkably comparable, elevated rates of adverse interpersonal childhood experiences and distress were found in both, subjects attending psychiatric care and subject at high risk for psychosis. Some significant associations with positive psychotic symptoms, other psychopathology as e.g. depression, and current level of functioning, but not to transition into psychosis, were found in the high risk sample.

Conclusion: The results confirm that childhood adverse experiences and distress are markedly elevated in psychiatric samples. As the increase in the high risk sample was comparable to a community mental health care sample, and first analyses did not yield a clear association with transition into psychosis, such early experiences may be primarily a risk factor for developing mental disorder in general.

ALEXITHYMIA IS ASSOCIATED WITH PSYCHOTIC AND HYPMANIC SYMPTOMS

INSTITUTIONS
1. University of Tampere, Tampere School of Public Health, Tampere, Finland
2. University of Turku, Psychiatry, Turku, Finland

AUTHORS
1. Matti Joukamaa¹, Prof, MD, PhD, matti.joukamaa@uta.fi
2. Sinikka Luutonen²
3. Raimo K.R. Salokangas³

Objectives: The association of alexithymia with different kind of non-psychotic mental disorders has been verified in numerous studies. On the other hand, there are only sparse studies on the relationship of alexithymia and psychoses and the results seem to be a little bit inconsistent. We wanted to explore how alexithymia is associated with psychotic and hypomanic symptoms.

Methods: The material consisted of 668 primary health care patients in Finland. Data was gathered with a questionnaire. Alexithymia was measured with the Toronto Alexithymia Scale-20. The lifetime psychotic symptoms were 22 questions from the core psychosis section of the Composite International Diagnostic Interview (CIDI) and lifetime hypomanic symptoms with the Mood Disorder Questionnaire (MDQ). The sociodemographic background factors consisted of gender, age, marital status, working status and living situation.

The health status was measured with two subjective assessments (self perceived general health and functional ability).

Results: Alexithymia was significantly associated with both CIDI and MDQ sum scores due to the alexithymia facets Difficulties in Identifying Feelings and Difficulties in Description of Feelings. These associations remained also when the sociodemographic and health status variables were controlled for. Of the separate CIDI items 12 and of the MDQ items 9 had significant association with both TAS total score and the factors Difficulties in Identifying Feelings and Difficulties in Description of Feelings.

Conclusion: These findings warrant new studies on this field, an especially important topic could be to explore the meaning of alexithymia in the so called prodromal phase of psychoses.
TREATMENT RESISTANT DEPRESSION

INSTITUTIONS
1. Medical University of Vienna, Department of Psychiatry and Psychotherapy, Vienna, Austria

AUTHORS
1. Siegfried Kasper¹, Prof., sci-biolpsy@meduniwien.ac.at

PROPOSAL FOR SYMPOSIUM:
Treatment resistant depression has been documented in about 20-30% of patients diagnosed with depression. Future challenges include not only phenomenological characterisations but also a distinction on a molecular genetic level.

DEFINITION AND UNDERSTANDING OF TREATMENT RESISTANT DEPRESSION

INSTITUTIONS
1. Chaim Sheba Medical Center, Department of Psychiatry, Israel

AUTHORS
1. Joseph Zohar¹, Prof., MD, joseph.zohar@sheba.health.gov.il

Patients for whom the diagnosis of depression was established and who did not respond to adequate treatment are defined as suffering from resistant depression (RD). It has been estimated that 30-40% of depressed patients do not respond to an adequate treatment attempt. Those patients occupy more and more of psychiatrists’ time, since for many depressed patients the first-line of treatment is provided by their general practitioners. Hence, there is an over-representation of RD among patients who end up being sent to psychiatrists because they did not respond to treatment (mostly with SSRLs).

After careful review of issues such as diagnosis, dose, and treatment duration, and ruling out a possible medical condition, the diagnosis of RD is warranted. Although the current knowledge about the biology of RD is lacking, it is becoming increasingly clear that a diagnosis of RD does not imply a ‘bad’ patient (who does not want to improve) or a ‘bad’ physician (an incompetent psychiatrist). It might actually mean that the relevant patient is truly treatment-resistant, and probably reflects one of several subtypes of depression which are yet to be identified.

Along these lines, identifying the various underlying psychobiological abnormalities might assist us in tailoring treatment to the specific patient.

The therapeutic intervention should include, on top of a well-thought-out and carefully built plan of treatment, a fundamental value including empathy, comforting and support, along with confidence, which might only derive from in-depth knowledge of the current state of the art in treating those difficult-to-treat patients.
EUROPEAN STUDY GROUP ON TREATMENT RESISTANT DEPRESSION

INSTITUTIONS
1. Hopital Erasme, Department of Psychiatry, Belgium

AUTHORS
1. Julien Mendlewicz1, Prof., MD

Outcome studies have demonstrated that approximately one third of patients treated for major depression do not respond to antidepressant pharmacotherapy and has led to the concept of Treatment Resistant Depression (TRD). In order to investigate clinical predictors of resistance, we collected within a EUROPEAN MULTICENTRE STUDY a large cohort of unipolar depressed patients. The depressive episode was considered as resistant in case of nonresponse to at least two adequate consecutive antidepressant trials during the last episode.

702 subjects were considered for the analysis, including 356 patients defined as resistant and 346 as non resistant. Diagnoses were obtained using the MINI. A HAMD 17 items was obtained for each patient at inclusion. A two-step logistic regression model was applied for the analysis of predictive factors of resistance. Among the clinical features investigated, using a two-step logistic regression model, five predictive factors were identified: comorbid anxiety disorder (p<0.001, OR=5.2), current suicidal risk (p=0.05, OR=2), severe intensity of the episode (p=0.04, OR=2.1), melancholic features (p=0.03, OR=2.5) and nonresponse or unsatisfying response to first antidepressant treatment lifetime (p=0.003, OR=4.4). In conclusion, our findings provide a set of relevant clinical variables associated to treatment resistance in major depressed patients. The predictive value of the TRD associated clinical variables can be assessed in well designed prospective therapeutic trials.

IS SWITCHING TO ANOTHER MECHANISM OF ACTION A PROVEN CONCEPT IN TREATMENT RESISTANT DEPRESSION (TRD)?

INSTITUTIONS
1. University of London, Imperial College, School of Medicine, London, United Kingdom

AUTHORS
1. Stuart Montgomery1, Prof, MD, stuart@samontgomery.co.uk

It is widely assumed without evidence that switching antidepressants to a different mechanism of action will be beneficial in treating resistant depression. In this prospective study, conducted by the Group for the Study on Resistant Depression (GSRD), a group of patients with a history of treatment resistance or non-response to a range of antidepressants at an adequate dose and for an adequate duration, were treated prospectively with either citalopram (an SSRI) or desipramine (a noradrenaline reuptake inhibitor). Those who failed to respond at 4 weeks and therefore satisfied full prospective criteria for TRD were randomized to receive the same treatment or the alternate treatment. The results showed significantly less benefit for switching and the most benefit for remaining on the same treatment (p<0.05).

Conclusion: The results of this study show that remaining on the same treatment was associated with best response rather than switching TRD to an antidepressant with an alternate mechanism of action.
SECOND GENERATION ANTIPSYCHOTICS (SGA) IN TREATMENT RESISTANT DEPRESSION

INSTITUTIONS
1. Medical University of Vienna, Department of Psychiatry and Psychotherapy, Austria

AUTHORS
1. Siegfried Kasper, Prof., MD, sci-biolpsy@meduniwien.ac.at

Although antipsychotics are used mainly in schizophrenia and bipolar disorder, it soon emerged that they are also helpful for treatment of depression.

Typical neuroleptics have been used in clinical practice as an add-on therapy for unipolar depression. However, the emergence of extrapyramidal symptoms (EPS) and subsequently tardive dyskinesia (TD) during this treatment indicated them as a problematic choice. With the introduction of the so-called atypical antipsychotics (second generation antipsychotics, SGA) it was soon apparent that they are also helpful for treating refractory depression. On a pharmacodynamic level, this clinical observation is backed up by the notion that SGA also exert an antidepressant mechanism of action like the 5-HT2C blocking properties and some of them additionally serotonin or noradrenaline reuptake mechanisms. The few studies carried out in this field indicated that the addition of an SGA, like risperidone or olanzapine, results in a significantly higher proportion of treatment responders. A number of studies also documented the therapeutic properties of the combination therapy of antipsychotics and antidepressants in unipolar depression with psychotic features. Interestingly, similar dosages as have been used for treatment of schizophrenia should be used for this indication. Antidepressant properties of SGA are recently also substantiated by the findings that these compounds (like quetiapine and olanzapine) are of therapeutic benefit in bipolar depression. Altogether, atypical SGA can be considered as a valuable addition for treating refractory and psychotic unipolar depression.

NEW PERSPECTIVES IN THE FIELD OF PSYCHOSOMATIC MEDICINE

INSTITUTIONS
1. University of Texas Health Science Center, Psychiatry (pedro.ruiz@uth.tmc.edu), Houston, Texas, United States

3. Edmond H Pi, Professor, MD
4. Nada L. Stotland, Professor, MD
5. Miguel Roca, MD

AIMS/OBJECTIVES:
1. To learn about current advances in the field of Psychosomatic Medicine
2. To be informed about the areas of the field of Psychosomatic Medicine that have achieve great recognition recently, e.g., psycho-oncology, HIV/AIDS, pain management, etc.
3. To understand the requirements for fellowships and certification in this area of subspecialization.

The field of Psychosomatic Medicine and/or Consultation & Liaison Psychiatry has gained momentum, recognition and much legitimacy in recent years. For instance, in the United States, this field has been officially accepted as an area of subspecialization in Psychiatry and Neurology. As a result of this action in the early 2000s, a one year fellowship is required to seat for this exam and be officially certified in this subspecialized area of the field of psychiatry.

Additionally, in the last one or two decades, the field of Psychosomatic Medicine has grown extensively in a series of key and relevant areas such as: psycho-oncology, women’s mental health, HIV/AIDS, pain management, etc. It is, therefore, very important for psychiatrists and other mental health professionals worldwide to be informed of the new educational and investigational advances in this field. In this symposium, these key and relevant aspects of this field will be presented and discussed with an emphasis on the advances and new perspectives recently secured in the United States.

CURRENT EDUCATIONAL PERSPECTIVE IN PSYCHOSOMATIC MEDICINE

INSTITUTIONS
2. Tulane University, Psychiatry, New Orleans, LA, United States

AUTHORS
1. Daniel K. Winstead², Dr., MD, winstead@tulane.edu

Objectives
After attending this symposium presentation the participants will
1. Learn about the current educational trends of Psychosomatic Medicine in the USA.
2. Understand the content of the USA Psychosomatic Medicine Certification process.
3. Able to develop an educational plan directed to certification and re-certification in Psychosomatic Medicine in the USA.

The field of Psychosomatic Medicine has greatly advanced in recent years in the United States. Similar advances are also taking place in this field in other industrialized nations such as Canada, the United States and other European countries. In this regard, the educational process in this type of field has advanced in the last decade that a new certification and re-certification process was designed and implemented in the early 2000s in the United States by the American Board of Psychiatry and Neurology. These efforts have led to the implementation of a one year accredited fellowship in psychosomatic medicine as a pre-requisite to take an exam leading to certification in this subspecialty area which is valid for ten years. Subsequently, a second exam ten years later will lead to re-certification status in this field.

In this presentation, we will highlight the most important areas of this exam leading to certification. Hopefully, this presentation will lead to an educational discussion that will offer further light as to how to become competent in this very relevant area of the field of psychiatry.

PHARMACOTHERAPY OF DEPRESSION: A CROSS-CULTURAL PERSPECTIVE

INSTITUTIONS
1. University of Southern California (USC) Keck School of Medicine, Psychiatry, Los Angeles, United States

AUTHORS
1. Edmond H. Pi¹, ehpi@usc.edu

Objectives:
1. Understand the issues regarding the role of ethnicity and culture when diagnosing and treating depression
2. Recognize the importance of the influence of ethnicity and culture on pharmacotherapy of depression
3. Learn recent new developments and future directions with respect to cross-cultural issues of pharmacotherapy of depression

The multiplicity of ethnic and cultural groups throughout the world needs to be recognized. This is particularly essential to understand the issues regarding the role of ethnicity and culture when diagnosing and providing mental health care to diverse populations in the world. The influence of ethnicity and culture on psychotropic medications has become an important clinical consideration. This presentation will provide an overview on the existing information in regard to cross-cultural perspective on pharmacotherapy of depression which is one of the most common conditions encountered in the field of psychosomatic medicine. The ultimate goal is an integrative approach in which both ethnic or cultural diversity and biological diversity are taken into account and treatment is tailored to specific individual characteristics. New developments and future directions with respect to cross-cultural issues of pharmacotherapy of depression will also be discussed.

PSYCHOSOMATIC MEDICINE WITHIN PRIMARY CARE

INSTITUTIONS
1. University of Islas Baleares, Psychiatry, Palma, Spain

AUTHORS
1. Miguel Roca¹, Dr., mroca@clust.uib.es

Objectives
1. Understand the different aspects of depression comorbidity in primary care settings.
2. Learn how to assist primary care professionals to better diagnose and treat depression in primary care.
3. Recognize the relationship between cardiovascular illnesses and depression in primary care practice.

The field of psychosomatic medicine has advanced very rapidly in all areas of medicine and psychiatry; however, this advance has not taken place within the field of primary care with the same speed then in other areas of medicine. It is, however, very important that efforts to assist primary care professionals to better diagnose and treat psychosomatic conditions be improve in the near future. In the United States, about fifty percent of the mental health care services take place in primary care settings; therefore, attention and emphasis in this area of medicine is a priority at the present time. This situation is also observed in other countries as well; for instance, in Europe. In this context, my presentation will focus on experiences currently taking place in Spain. Hopefully, this presentation will permit the participants in this symposium to focus in our experiences in Spain, and to adapt these learning experiences to other regions and areas of the world.

Reference
The four presentations focus on mental health issues related to HIV in women from different cultures.

The first, is a report on a pilot intervention using participatory action groups to promote the mental health of widows of injecting drug users in North eastern India, as a strategy for HIV prevention. Participants’ quality of life, mental health and experience of somatic symptoms improved significantly over the course of the intervention. The second presentation from Uganda focuses on mental health, HIV and conflicts and sexual and reproductive health rights among adolescent girls and youth with (peri-natally acquired) HIV. The next report focuses on gender differences in quality of life among people living with HIV in South India using the WHO Quality of Life - 120 instrument. While women had poorer quality of life compared to men in most areas, they reported significantly higher spiritual quality of life, particularly on the facet on Forgiveness. The cultural relevance of these findings in the context of mental health will be discussed. Finally, we report findings, from a Midwest city in the US, on a randomized, controlled field trial for reducing high risk behaviors among female offenders enrolled in Drug Court. The peer-delivered intervention focused on assistance completing judge mandated tasks and providing education on health-promoting activities. The presentation will address the sociodemographic, psychiatric and sexual risk behavior characteristics of women in our study who participate, who enroll, and who complete the intervention. Ways in which women’s mental health can be integrated into HIV interventions will be discussed.

A PILOT INTERVENTION TO PROMOTE MENTAL HEALTH AMONG VULNERABLE WOMEN IN INDIA

4. Bernadette Dzuvichu Dzuvichu, Ms., B.Sc
5. Thomghood Gilbert, Mr., B.Sc
6. Helen Herrman, Dr., MD, H.Herrman@unimelb.edu.au

A pilot intervention aimed to evaluate the use of participatory action groups to promote the mental health of widows of injecting drug users as a strategy for HIV prevention. A pilot intervention over 20 weeks included 74 widows in 6 peer-facilitated participatory action groups, with a focus on promoting mental health. Participants' quality of life, mental health and experience of somatic symptoms improved significantly over the course of the intervention. A participatory approach to mental health promotion can have a positive impact on the lives of vulnerable women, and the potential to contribute to HIV prevention. Further investigation is warranted.
MENTAL HEALTH, HIV AND CONFLICT AMONG ADOLESCENT GIRLS IN AFRICA

INSTITUTIONS
1. Makerere Institute of Public Health, Kampala, Uganda

AUTHORS
1. Florence Baingana¹, Dr., fbaingana@musph.ac.ug

Mental health and HIV have an important interface across all ages and genders, however some groups are more vulnerable to mental health problems. In Sub-Saharan Africa where there are many adolescent girls and youth with (perinatally acquired) HIV, mental health subserves even greater importance.

Children, adolescents and young adults who acquired their infection from perinatal infection are now between 18 and 24 years and are often stigmatised. They have mental health problems which often manifest as somatisation and hence maybe undetected and undertreated.

Several of the areas where these young women live are also areas ridden with conflict that add to the disease burden. Under these circumstances promotion of mental health and enhancement of reproductive health rights for adolescents with perinatally acquired HIV infection becomes very important.

This presentation will focus on sexual and reproductive health rights and their relationship with mental health in this specific group of HIV infected young women, based on experiences from the region.

DO MEN AND WOMEN WITH HIV DIFFER IN THEIR QUALITY OF LIFE? A STUDY FROM SOUTH INDIA

INSTITUTIONS
1. National Institute of Mental Health and Neurosciences, Psychiatry, Bangalore, India
2. Seva Clinic, Bangalore, India
3. University of Miami School of Medicine, Department of Psychiatry and Behavioral Sciences, Bangalore, India

AUTHORS
1. Prabha S. Chandra¹, Dr., prabhasch@gmail.com
2. Veena Satyanarayana¹, Ms, M.Phil
3. Satish K.S²
4. Satishchandra P³, Dr.
5. Mahendra Kumar³, Dr.

Gender differences in Quality of Life (QOL) among people living with HIV/AIDS in South India were examined. QOL was measured using the locally validated version of the WHO Quality of Life Instrument for HIV (WHOQOL-HIV-120). Participants (N=109) were men and women with HIV Clade C infection participating in a cohort study. The study was supported by an NIH R01-41205 grant from NIH, USA. Significant gender differences emerged on five facets and two domains of the WHOQOL-HIV. Men reported significantly higher QOL in the following facets- positive feeling, sexual activity, financial resources, transport, and in the environmental domain. Women reported significantly higher QOL on the forgiveness and blame facet and the spirituality/religion and personal beliefs domain.

There are gender differences in QOL among the HIV infected. Understanding these gender differences may provide potentially useful information for tailoring interventions to enhance QOL among people infected with HIV/AIDS. The association of better spiritual quality of life in women merits further study.
FEMALE OFFENDERS LIVING IN THE COMMUNITY: INTERVENTION STRATEGIES FOR REDUCING HIGH RISK BEHAVIORS

INSTITUTIONS
1. Washington University School of Medicine, Department of Psychiatry, St. Louis, MO 63108, United States

3. Catherine Striley¹, Dr.
4. Arbi Ben Abdallah¹, Dr.
5. Robert Crecilius²

Data from our prior HIV intervention studies indicate that women, especially female offenders, find it more difficult to change high risk behaviors than men. Based on this, our group, the Epidemiology and Prevention Research Group at Washington University School of Medicine, developed a high risk behavioral, peer delivered intervention focused on the needs of these women. Prior to initiating the study, project investigators sought the input of the staff and leadership of the Department of Corrections—judges, staff and parole officers, as well as the women themselves. Focus groups were conducted with women in correctional facilities to ensure the relevance of the intervention. Through this participatory process, a peer delivered intervention focusing on assistance completing mandated tasks by Drug Court judges, which provided education concerning health-promoting activities, was developed to provide 40 hours of Peer Partnered Case Management Intervention over a 10 week period scheduled at the participant’s convenience. To date, this intervention has been randomized to a sample of half the total sample of 250 women. Because these women are usually under-represented in most studies, the data from this study are particularly important. The presentation will address the sociodemographic, psychiatric and sexual risk behavior characteristics of women in our study who participate, who enroll, and who complete the intervention.

2. Pedro Ruiz¹, Prof, MD, Pedro.Ruiz@uth.tmc.edu
3. Nada Stotland³, Prof, MD, nadast@aol.com
4. Sheila Hollins, MD, shollins@rcpsych.ac.uk

Mental health professionals and their patients are increasingly aware of the basic need of all human beings for a source of meaning that is greater than one’s self. This growth in awareness is driven by the professional’s practical goal of reducing disability from mental disorders and by the heart felt wishes of the suffering for their therapists to recognize the need for self transcendence. This has resulted in mental health professionals and the general public’s growing awareness of the need to foster spirituality and well-being in clinical practice. We now see a groundswell of professional work to focus on the development of health and happiness, rather than merely to fight disease and distress. This symposium will consider the practical necessity to reduce disability, and understanding the science of well-being including the stages of self-awareness on the path to well-being. Presenter will discuss the role of spirituality in recovery and functioning for patients with mental illness. This allows for attention to spirituality based on principles of psychobiology with roots in compassion and tolerance, rather than on the basis of dogmatic judgments that are rooted in fear and intolerance.

Thus only by addressing spirituality in a scientific and non judgmental manner can we make psychology and psychiatry into a science of well-being that is able to reduce stigma and disability of psychological disorders. Speakers will consider the dimensions of spirituality and well-being from its application in Latin Americas, United Kingdom, USA and Asia Pacific regions.

PSYCHIATRY AND MANAGEMENT OF SEXUAL DYSFUNCTION

INSTITUTIONS
1. Geha Mental Health Center, Petah Tikva, Israel
2. Wayne State University, Department of Psychiatry and Behavioral Neurosciences, Detroit, Michigan, United States

AUTHORS
1. Zvi Zemishalny1, Prof., MD, zzemishalny@clalit.org.il
2. Richard Balon2, Prof., MD, rbalon@wayne.edu

The symposium's objective is to emphasize the central role that psychosocial factors play in human sexual functioning. The symposium calls on psychiatrists, as they are uniquely trained in the biological and psychotherapeutic approaches to human sexuality, to actively lead this area of medicine, thus not losing it to other medical disciplines.

DOES PSYCHIATRY HAVE A (SPECIAL) ROLE IN THE MANAGEMENT OF SEXUAL PROBLEMS?

INSTITUTIONS
1. Wayne State University School of Medicine, Department of Psychiatry and Behavioral Neurosciences, Detroit, Michigan, United States

AUTHORS
1. Richard Balon1, Prof., MD, rbalon@wayne.edu

Recently, we have witnessed an expanded role of various disciplines, such as urology and gynecology in the area of management of sexual dysfunction recently. However, through the history of modern medicine, psychiatry has played a very important, if not central, role in our understanding of human sexuality, and in managing sexual dysfunctions. Many important clinical descriptions and discoveries in this area have been made by psychiatrists. Psychiatrists also created the basic classification of sexual dysfunctions.

Human sexuality presents a very complex and complicated interaction of biology and psychology, which is reflected in a complex physiological response. Every aspect of human sexual functioning, even the simplest one, is regulated on the central and peripheral nervous system levels, modified by various hormones, impacted by vascular changes, and influenced by expectations, interpersonal issues, intrapsychic processes, personal habits, aging, mental and physical diseases, substance abuse (e.g. smoking), and medications (namely psychotropic ones).

Recent approaches to human sexuality from both “extreme” positions of either biology & pharmacology or psychology & sex therapy, present overly simplistic and trivial solutions of very complex issues. These approaches are not in the best interest of patients. Only psychiatry with its focus on biopsychosocial aspects of human sexuality seems to be able to handle all the challenges of human sexuality and the management of sexual dysfunctions. In conclusion, we argue that psychiatrists are uniquely trained in the biological and psychological approaches to human sexuality and its impairments. Psychiatry needs to reinvent itself as the leader in this area of medicine.
MANAGEMENT OF SEXUAL DYSFUNCTIONS: IS PSYCHIATRY LOSING IT TO OTHER MEDICAL DISCIPLINES?

INSTITUTIONS
1. Geha Mental Health Center, Petah Tikva, Israel
2. Tel Aviv University, Sackler Faculty of Medicine, Tel Aviv, Israel

AUTHORS

Sexual dysfunctions (SD) are common, distressing and complex biopsychosocial conditions. Their prevalence in persons with mental disorders and personality disorders is higher than in the general population. Traditionally, SD was managed by psychiatrists and psychotherapists. In recent years, psychiatrists seem to show less interest in sexual behavior and dysfunction, leaving the field to other medical disciplines, such as urologists, gynecologists and endocrinologists.

The presentation’s aim is to focus on the cardinal role that the psychosocial factors play in the development of the two most common sexual dysfunctions: female hypoactive sexual desire and male erectile dysfunction. The high prevalence of desire and arousal disorders among females (40% - 80%) cannot be explained merely by biological or hormonal factors, which are controversial. Individual psychological factors, interpersonal relationships, length of relationship, advanced age, lifestyle, depression, anxiety, socio-economic class and cultural background have been shown to correlate with low sexual desire. Regarding erectile dysfunction, although treatment with phospho-diesterase type 5 (PDE5) inhibitors is revolutionary and effective, the consumption did not grow as expected. More than half the users stopped using the medications mainly for psychosocial reasons: high cost, loss of interest in sex, and partner reluctance.

Conclusions: Low sexual desire and erectile dysfunctions often reflect difficulties in interpersonal relations, depression or anxiety. Their management requires adequate clinical and psychotherapeutic skills. Psychiatrists should not be discouraged from having to take into consideration hormonal or vascular factors while taking an active role in the management of sexual health.

WHY PSYCHIATRISTS ARE AFRAID OF SEX?

INSTITUTIONS
1. UCV, Psychiatry, Caracas, Venezuela

Scientific Sexology began with Krafft-Ebing, with Psychopathias Sexualis in the XIX Century. Later on the German School, with Hirschfield, Moll, Marcuse and Bloch, developed the field before Hitler, (Heberle l983, WAS Exhibition) Later on Kinsey, Masters and Johnson, Kaplan and the creation of the World Association for Sexology, in Rome (1978) with many other scientists mainly from Psychiatry created a new science Sexology. Time has changed since 1998 when sildenafil appeared and a complete medical revolution took place, 10 years for now. Now we see a displacement of Psychiatrists and several specialties are taking over the leadership in this wide and complicated area of Medicine. Several reasons may be pointed out, We will discuss the basis for this critical phenomena. WPA developed a Section and a Sexual Health Educational Program. Lack of resources and heavily competition for that, are also reasons to complete this very extensive and integrative Program. A book Psychiatry and Sexual Health (Mezzich and Hernandez) was published in 1986. (www.rowman & littlefield.com). Sexual Health and Sexual Human Rights are so important in this today’s world. (Valencia Declaration WAS l997). Now we have many tasks ahead specially when DSM V and ICD 11 are coming and many sexual problems arise worldwide.
THE RELATION OF SEXUAL ORIENTATION AND GENDER IDENTITY DISORDERS TO SEXUAL DYSFUNCTIONS: HOW TO MANAGE?

INSTITUTIONS
1. Cairo University, Psychiatry, Cairo, Egypt

AUTHORS
1. Said Abdel Azim¹, Professor, MD, PhD, saidazim@yahoo.com

Homosexual orientation can be the cause of Sexual Dysfunction in the male (Erectile Dysfunction) or the female (Failure of Arousal) in a heterosexual context. In homosexual males retrospective studies proved that many of them gave histories of gender childhood disorders marked by their femininity which developed later into homosexual, where they are attracted by the same sex as they identified early with female figures.

Prevention early during childhood through the change of attitudes of the parents can help. Later in adulthood it can be more difficult to have a change especially in syntonic types and exclusive homosexuals.

Therapy through an eclectic approach of psychodynamic, cognitive behavioral and supportive psychotherapies can succeed in highly motivated persons like those not accepting homosexuality (Ego Dystonic).

2. Ramon Almanzar¹, PhD, inst.sex.humana@codetel.net.do
3. Ana T. Mena¹, Mrs., PhD, inst.sex.humana@codetel.net.do

Objectives: To identify the presence of Attention Deficit Disorder (ADD) in a population requesting services at the Institute of Human Sexuality (IHS).

Method: Samples of 56 patients attending the IHS were asked to fill out the Brown Rating Scales for ADD. Patients had to fulfill DSM-IV diagnostic criteria for a sexual dysfunction. Thirty-four (60.8%) were males and 22 (39.2%) were females.

Results: Nearly 54% of the patients fulfilled the diagnosis of ADD. It is more common in females than males (59% vs 50%). Of the 13 women with ADD 5 (61.5%) suffers from Anorgasmia and 8 (38.5%) from Hypoactive sexual desire disorder. Of the 17 male with ADD 11 (64.7%) had Premature Ejaculation; 5 (29.4%) had Erectile dysfunction. Voyeurism was present in one case. The non-ADD had similar dysfunction, although less represented.

Conclusions: ADD has been described across the life cycle as a disorder that impairs functioning and interferes with relationships. It is also characterized by a high prevalence of co-morbidities that unless they are treated separately, none of the difficulties will be successfully treated. In this presentation anorgasmia was identified as the most common condition in women and Premature Ejaculation in males. Both conditions are highly prevalent in a sexual dysfunction clinic; therefore psychiatrists have a unique role treating patients with sexual dysfunctions and ADD, therefore, we should bare in mind this co-morbid condition, so that both entities are properly treated. At the Institute we have establish as a routine screening patients for Depression and ADD.

PSYCHOANALYTIC PERSPECTIVE IN DIFFERENT SETTINGS

INSTITUTIONS
1. Turkish Neuropsychiatric Society, Istanbul, Turkey
2. Dynamic Psychiatric Hospital, Psychiatry, Menterschwaige, Munich, Germany

AUTHORS
1. Peykan G. Gokalp¹, Assoc. Prof., MD, peykang@superonline.com
2. Egon Fabian², Dr., MD, efabian@klinik-menterschwaige.de

Psychoanalytic perspective is influential in certain treatment settings in mental health institutions and departments. Psychoanalytic theory and principles are used in understanding the person, formulating the disorder and also in the organization of the therapeutic team and setting. Although biological interventions have become dominant in many institutions, psychoanalytic perspective is a means of diagnosis and treatment for both the individual patient and the interaction between the patient and the ward and the team.

Generally valid in the treatment of personality disorders, depression and anxiety disorders, eating disorders and substance dependency, psychoanalytic approach deals with transference, counter transference issues, defence mechanisms, symbolization of the symptom, institution, medication and language. The objective of the symposium is to put forward theoretical and clinical experience on different patient groups and treatment settings. The organization and the function of a large psychiatric hospital, group psychotherapy setting, eating disorder and borderline patients.

PSYCHOANALYTIC PERSPECTIVE IN A LARGE PSYCHIATRIC HOSPITAL: IS INSTITUTIONAL PSYCHOANALYSIS POSSIBLE?

2. Margit Schmolke, margitschmolke@aol.com

The authors will outline the significance of psychodynamic and group dynamic elements in patients and staff members within inpatient psychotherapeutic treatment. They focus on Günter Ammon's concept of dynamic psychiatry and how its practice can aid and enhance group dynamic understanding. The authors will illustrate various levels of psychodynamics and group dynamics being present in single patients, in patient groups, in the large group of the therapeutic milieu, in staff members and in interaction between patients and staff. By getting access to these underlying dynamics, illness processes and specific expression of symptoms can be understood more comprehensively.

FORMING PSYCHOANALYTIC FRAME IN A LARGE PSYCHIATRIC HOSPITAL: EXPERIENCE WITH BORDERLINE PATIENTS

INSTITUTIONS
1. Istanbul Psychoanalytic Society, Istanbul, Turkey

AUTHORS
1. Dilek Özer, cdilekozer@superonline.com

I am working in the largest psychiatric hospital of Turkey which is Bakirkoy State Training and Research Hospital for Psychiatry and Neurology. That was founded in 1927. There are closed acute and chronic inpatient wards and outpatients units in the hospital. Inpatient units have a total number of 1400 psychiatric beds. Acute inpatient beds provide services to all range of psychiatric patients. Chronic inpatient units usually provide shelter for mentally retarded or schizophrenic patients most of whom are homeless. Bakirkoy State Training and Research Hospital for Psychiatry and Neurology has a special significance in Turkey. It is supposed to provide mental health services and contain all Turkey. So there are huge expectations regardless of the capacity of hospital which causes blurring in the borders of the hospital. Therefore, forming psychoanalytic frame is very important under these conditions, to contain the patients. There were two Neurosis Units which have open wards for inpatients. Although their name were "neurosis clinics", actually nonpsychotic patients, most of them who had borderline personality organization had in and outpatient treatments. In this presentation, I will discuss main points in forming psychoanalytic frame in a large psychiatric hospital mostly based upon my experiences with these cases.
HOW RESIDENTIAL TREATMENTS CAN BECOME PSYCHOTHERAPY BY THE ENVIRONMENT WITH BORDERLINE ADOLESCENTS?

INSTITUTIONS
1. Advisor of the French Juvenile Justice Systems Direction, Paris, France

AUTHORS
1. Michel Botbol

Based upon the milieu residential treatment offered by a psychiatric clinic (Clinique Dupré of Sceaux), this communication will develop the idea that this treatment can be seen as a form of psychotherapy: psychotherapy by the context. In our experience this form of treatment is particularly suited to Borderline adolescent’s treatment because it takes into account the fact that their main defensive feature is the use of the environment to overcome the weakness of their inner world. An example will be given to show how this allows the therapeutic team to work as the patient’s „widened psychic space“ (Jeammet) by temporarily lending their thoughts and their imaginary abilities to make up for the patient’s disability to bear or elaborate its conflicts in its own inner space.

According to the aim of the Treaty of Rome from 1957 which postulated the free movement of workers throughout the EU, the European Board of Psychiatry in the UEMS carried out a comprehensive survey of training in psychiatry, including all member countries in order to evaluate the present state of training in psychiatry in each. The survey should indicate whether the training requirements have had an impact on the actual conditions of training in psychiatry in the member countries. We gathered 22 questionnaires from 31 national representatives involved and 424 questionnaires completed by the chief of training and the representative of trainees at the responding training centres from 22 countries. The results give an overview about the practice of training in psychiatry in many European countries. While there are great differences between the training centres in the different countries, obvious progress towards developing high standards in training in psychiatry has been made.

U.E.M.S. AND HARMONIZATION OF PSYCHIATRIC TRAINING AND CME IN EUROPE

INSTITUTIONS
1. Finnish National Student Health Service, UEMS Section of Psychiatry, Helsinki, Finland

AUTHORS
1. Kari Pylkkänen¹

Free movement of medical specialists in Europe is promoted by the European Directive on the Recognition of professional qualifications and harmonization of specialist training. The Section of Psychiatry of the Union of Medical Specialists in Europe (U.E.M.S.) presents a common professional platform of 35 countries in Europe for defining the minimum standards for good quality of specialist training, services and CME in Psychiatry.

The Section has issued a European Charter on Psychiatric Training and keeps it updated. By carrying out comparative studies on the status relevant training issues and preparing specific professional recommendations the Section helps the National Psychiatric Associations in their task of promoting best practices in Psychiatry in their countries. Extensive reports and recommendations have been issued on numerous topics concerning training and development of services; psychotherapy, the profile of psychiatrist, private practice in psychiatry, compulsory care, assessment and visitation of training centers etc.

In cooperation with AEP and WPA the Section and its Standing Committee on CME provides a European programme for quality control of Psychiatric CME.

The National Psychiatric Associations from all over Europe have participated in preparation of the European Training Charter and other recommendations, and they have adapted these recommendations in their National Training Programmes. The harmonization process has been very extensive all over Europe since the early 1990’s when the New Members States of EU have joined the Section in a very early stage of their countries’ process of joining the European Union.
NEW CURRICULUM REQUIREMENTS WITHOUT NEW RESOURCES

INSTITUTIONS
1. University of Louisville, School of Medicine, Louisville, United States

AUTHORS
1. Allan Tasman

Over the last several decades, in many parts of the world, and new era of standardization in medical education has emerged. The impact of this movement has been appreciable, and Psychiatric training has been transformed in significant ways. Historically, sites known for excellence in education emphasized a particular aspect of the field, e.g. psychoanalytic psychotherapy or molecular biology. While training at these sites might not have been outstanding across the board, the centre of excellence was viewed as important enough to attract highly qualified and motivated trainees. As standardization of training expectations has become more extensive, such centers have needed to shift resources to areas previously under-emphasized, with no new resources available to implement the broadened expectations. In addition, new requirements for documentation of experiences, evaluation, and accreditation have also been implemented without new resources. Thus, a paradoxical response has been seen as educational leadership have embraced policies directed toward improving educational outcomes, but simultaneously have bemoaned the need to accomplish these laudable goals without new resources. The dilemmas about, and possible solutions to, these conflicting phenomena will be explored in this presentation.

HARMONIZATION OF CME IN THE WORLD

INSTITUTIONS
1. Psychiatric Center Rigshospitalet, København, Denmark

AUTHORS
1. Anne Lindhardt
2. Levent Küey

Psychiatry is a medical discipline with branches into fields of other sciences. The medical evolution seen throughout the past 15 years precising the interaction of biology and social and psychological understanding has brought forward new knowledge on least in terms of psychotherapy. There is a need to secure the sharing of new knowledge in order to provide the best possible assessment and treatment for patients around the world in spite of enormous differences in resources and accessibility. One tool is to implement a system of CME on a world wide basis. Throughout a number of years the attempt to harmonize training for psychiatry has characterized the countries of EU. CME through a clearing house under UEMS EACCME respecting national rules has been developed. WPA is now developing a system inspired by UEMS but targeting a world wide population. The preparation and thinking behind this system will be presented along with the preliminary plans, in order to bring the plans to discussion in a larger forum.

In 1348, the Roman Emperor and at the same time the Bohemian King Charles IV established the oldest University in Central Europe (Charles University) in Prague comprising all the faculties, including medicine. The lectures were held in Latin. In 1654, Charles University was renamed to the German-speaking Karl-Ferdinand University. It wasn't until 1790 that a „mental home for lunatics - Custodiae mente captorum” was established in the newly opened General Hospital in Prague. Education of students in the field of psychiatry based on practical approaches started in 1821 as part of internal medicine while special lectures held by Joseph Riedel who is considered to be the first associate professor in the entire Habsburg Monarchy, were offered only since 1841. In 1882, the university was divided into German and Czech parts; however, corresponding psychiatry clinics were only established in 1886.

Such renowned physicians and scientists as Arnold Pick (1886 - 1921, Pick’s disease, Pick’s Bundle), Otto Pötzl (1922 - 1928, brain swelling and catatonia) and Eduard Gamper (1930 - 1938, arhinencephaly), of “old Austrian” origin were the heads of the German clinic. The last director, Kurt Albrecht (1939 - 1945, brain tumors), who was also the last rector of the German university, came from Berlin. He died tragically in Prague in May 1945. The German Charles University was closed permanently after World War II. In recent years, the current Psychiatric Clinic, 1st Medical Faculty in Prague has participated in a number of European research projects (e.g. EDEN, EUROMIA, ISLANDS, EUPRIS) together with German partners. The traditional cooperation can go on under new European conditions.
TOWARDS A EUROPEAN PSYCHIATRY

INSTITUTIONS
1. Heinrich-Heine-University Düsseldorf, Department of Psychiatry, Düsseldorf, Germany

AUTHORS
1. Wolfgang Gaebel1, wolfgang.gaebel@uni-duesseldorf.de

During the annual conference of the German Society for Psychiatry, Psychotherapy and Nervous Diseases in Berlin in November 2007, a panel of „European Leaders in Psychiatry“ representing eleven European national psychiatric societies and the WHO Regional Office for Europe convened to discuss challenges that both Germany and European psychiatry are currently facing. The prevalence of mental disorders is rising causing a considerable amount of Burden of Disease in Europe. Advances in psychopharmacology and psychotherapy make successful therapy of mental disorders feasible, but there is a gap between a large number of people affected by mental disorders, and the number of people receiving adequate therapy. The stigmatization of people with mental disorders, psychiatrists and psychiatry as a medical specialty are among the major obstacles against implementing optimal therapy for all those in need. To improve the situation, the European Health Ministers have already in 2005 agreed upon a Mental Health Action Plan. Today, psychiatrists need to address issues of their identity and the identity of their specialty, not only on a national basis, but also on a European level. The UEMS „Profile of a Psychiatrist“ may guide future residency training, and certification of such training programs by the national scientific psychiatric societies is necessary. Also, the question whether the European psychiatrist should be a generalist with more differentiated subspecialties lies ahead. These and other issues concerning European Psychiatry will be discussed from a view of the German Society of Psychiatry, Psychotherapy and Nervous Diseases.

PSYCHIATRIC CLASSIFICATIONS- IS PSYCHIATRY MATURE TO RECONCILE RELIABILITY AND VALIDITY?

INSTITUTIONS
1. Charles University Medical School and Faculty Hospital Hradec Králové, Department of Psychiatry and Psychiatric Clinic, Hradec Králové, Czech Republic

AUTHORS
1. Jan Libiger1, libigerj@lfhk.cuni.cz

The birth of psychiatry was related to doubts whether mental disturbances should not be completely separated from the physical phenomena. These brain-mind split and related methodological differences were characteristic for psychiatry during a large part of its history. Contemporary classification represents a mixture of surviving categories from different but interacting classification approaches. Social influences rather than primarily medical discoveries co-determined the development of classification systems. Trade-off between validity and reliability is their persistent feature. From systems based on pure phenomenology and/or analytical narratives, the focus has shifted to the choice between fine grained categorial diagnoses based on clinical data and dysfunctional adaptive dimensions or modules. The technological advance in neurosciences may help to regain clinical validity of nosology by the identification of cognitive and motivational systems and processes at different levels of description, from molecular, neurochemical and physiological to neuropsychological and social. Personality structure with roots in the biology of adaptive dispositions, stress resilience, and regulatory variables like thresholds for cognitive and behavior releasing events and individual defense mechanisms may become the framework for revitalized clinical psychopathology. Recent psychiatric classification has served the administrative purposes rather than helping to understand recently accumulated knowledge on neurobiology of psychiatric disorders. A discussion on a new groundwork for classifications should precede the discussion on particular categories.

VULNERABILITY TO STRESS: FROM GENETICS TO PSYCHOMETRY - THE SPECIFIC CASE OF DEPRESSION

INSTITUTIONS
1. Faculty of Medicine - Coimbra University - Portugal, Chair of Psychiatry, Coimbra, Portugal
2. Coimbra University Hospital - Portugal, Head of the Psychiatric Department, Coimbra, Portugal

AUTHORS
1. Adriano S. Vaz-Serra1, Professor Dr., MD, PhD, adrianovs@netvisao.pt
2. Alda C. Ambrosio1, Mrs., MD, PhD, aldacardoso@inml.pt

Aims: Individuals with one or more copies of the short allele of the 5-HT transporter react more easily to stress-inducing events. Works made with the 23 QVs (a scale to measure “vulnerability to stress”) proved that the more vulnerable an individual is the more he/her is prone to react to stress inducing situations1. Negative rumination and worry are considered a vulnerability factor for depression2.

Objectives of the present work: to know the relative importance of genetic and psychological characteristics in individuals that have already been depressed.

Methods: 60 former depressed patients were compared with 60 normal individuals. Genomic DNA was extracted from peripheral lymphocytes by using enzymatic method. Used scales: the 23 QVs; the Perceived Stress Scale; the Ruminations Response Questionnaire and the Penn State Worry Questionnaire.

Results: In comparison with normals all the scales had higher significant means in the former depressed patients. A stepwise regression analysis, with patient/non-patient as the dependent variable, selected highly significant aspects in formerly depressed individuals. In this group 61% had one or more copies of the short allele of the 5-HT transporter and 39% had two copies of the long allele.

Conclusions: Psychological variables are more significant in depression than just the presence of the short allele of the 5-HT transporter.

ATTEMPTED SUICIDE, STRUCTURAL EQUATION MODEL, AND EXPRESSED EMOTION

INSTITUTIONS
1. Coimbra University Hospital, Suicide Research and Prevention Unit, Coimbra, Portugal

AUTHORS
1. Carlos B. Saraiva1
2. José C. Santos1
3. Francisco A. Veiga1

Objectives: From a 15-year experience, 1992-2007, (Suicide Research and Prevention Unit, Coimbra University Hospital, Portugal) involving 933 suicide attempters our aim was not only to define a sociodemographic and clinical scenario, and to find a structural equation model, but also to study levels of expressed emotion among patient’s relatives.

Methods: We applied a semi-structured questionnaire designed by our Unit (EACOS 1 77 items) covering both social and clinical aspects which explain the general portrait of the suicide attempters (n=933). Then we studied two sub samples: 1. n=165 assessed by Depression, Self-concept, and Coping rating scales reliable and valid for the Portuguese population 2, 3, 4 and other Psychopathology, and Internality psychometric tools comparing with a normal population with the same size. We used Amos 5.0 in order to establish a mathematical model. 2. n=34, a prospective study carried out over 9 months. We used the Camberwell Family Interview 5 for the evaluation of expressed emotion (taping and analysis) comparing with a normal population with the same size.

Results: Concerning the suicide attempters the most relevant data are: Young female, low social class, less schooling, poor family relationships, impulsivity, drugs, toxics, affective quarrel, guilt, alcohol, suicide notes, and multiple vulnerabilities during development, early traumatic life events, and lack of a confidant friend. Concerning the mathematical model: After loading factors and construct analysis we emphasise, by decreasing order, depression, Coping and Self-concept. Concerning the relatives: Most of them had high expressed emotion with high emotional over-involvement followed by criticism, and hostility.

Conclusions: A systemic better understanding of the suicidal behaviour shows new perspectives for the secondary prevention related to personal circumstances, social and familial problems.
OBSESSIVE COMPULSIVE-RELATED DISORDERS AND PERFECTIONISM: A STUDY IN A PORTUGUESE POPULATION

7. A. Cabral
8. J. Valente
9. F. Pocinho
10. M. Pato
11. M.H.P. Azevedo

Objectives: The main objective of this study was to evaluate if perfectionism is a personality dimension which is specifically related with obsessive compulsive disorders.

Method: Seventy outpatients - general psychiatric sample - patients with a diagnosis of depression/anxiety (without comorbid OCD), 70 patients - spectrum sample, patients diagnosed with obsessive compulsive (n=39)/eating disorders (n=24) and a mixed sample with OCD comorbid with ED (n=7) and 65 non-clinical control participants completed the Portuguese versions of the Hewitt & Flett Multidimensional Perfectionism Scale.

Results: Compared to non-clinical subjects, individuals of both clinical samples had significantly higher scores on perfectionism total scale, self-oriented perfectionism and socially prescribed perfectionism. No significant differences were found in those variables between the two clinical samples, except subjects with an eating disorder had significantly higher scores of socially prescribed perfectionism, compared with both OCD patients and subjects from the General Psychiatric sample.

Conclusion: Considering the results from the present study we can not conclude that perfectionism (or any of its dimensions) is specifically related to obsessive-compulsive spectrum disorders as a whole. However, differences between Eating Disorder patients and OCD and depressed/anxious patients on socially prescribed perfectionism, warrant further investigation in order to clarify the specificity of this perfectionism dimension in eating disorders.

ASSESSMENT OF STRESS VULNERABILITY AMONG WAR VETERANS WITH THE 23 QVS - A PORTUGUESE INSTRUMENT

INSTITUTIONS
1. Coimbra University Hospital, Traumatic Stress Outpatient Clinic, Coimbra, Portugal

AUTHORS
1. João Monteiro-Ferreira

Objectives: To evaluate the importance of stress vulnerability as measured by the 23 QVS on the presence of Posttraumatic Stress Disorder (PTSD). Comparing the results of the above mentioned variable in veterans with and without PTSD, as well the impact of each factor on PTSD, are also performed.

Methods: A convenience sample, composed by 196 veterans (former Marines) who volunteered for the Portuguese colonial wars (from 1961 to 1975), was assessed with the following instruments: Clinician Administered PTSD Scale (CAPS; Blake et al., 1995), PTSD Assessment Scale (EAPTS; McIntyre & Ventura, 1997), and 23QVS (Vaz Serra, 2000). Differences between groups were assessed through t Test.

Results: The study of this sample has shown that 59.2% of the veterans fulfil criteria for PTSD according to DSM-IV. There was an important discrepancy between groups on "Global Vulnerability", greatest among PTSD veterans. The major differences in vulnerability were due to Factor 1 ("Perfectionism and intolerance to frustration") and Factor 5 ("Existence dramatization"). High scores of 23QVS Global Efficiency (84.2%), Sensitivity (85.3%), and Specificity (82.5%) for the diagnosis of PTSD were found. A score of 46 as cut-off point for this diagnosis was determined.

Conclusion: 23QVS must be considered of high value concerning PTSD epidemiologic studies, and the characterization of individuals per se, both for diagnostic/therapeutic purposes, and for preventive effects, detecting those carrying vulnerabilities for developing PTSD.
**WORLDWIDE CONTINENTAL ASSOCIATIONS FOR YOUNG PSYCHIATRISTS AND TRAINEES: WORK IN PROGRESS**

**INSTITUTIONS**
1. Free University, Psychiatry, Amsterdam, The Netherlands

**AUTHORS**
1. Victor JA Buwalda, Dr., MD

In the rapid changing world Young Psychiatrists are better and better organised. Since there is a Worldwide organisation for Young Psychiatrists and Trainees, the WAYPT, there are developing more associations per continent. The European Federation of Psychiatric Trainees, the EFPT, is the oldest organization of its kind. It was founded in 1992. In this symposium the presenters are representatives of different continents: Asia, the North Americas, Europe and the Latin Americas. The new developments in these continents will be highlighted.

**TYPAA, TRAINEES AND YOUNG PSYCHIATRISTS AND YOUNG PSYCHIATRISTS ASSOCIATION OF ASIA**

2. Yee Ming, Dr., MD

At this moment, many Asian countries are experiencing economic growth. The globalisation worldwide is merging many countries to expand its capabilities. Because of this globalisation, the mental health care system in many Asian countries is experiencing changes and growth. More doctors and other medical facilities are needed. The interest is growing for an organisation at a national, regional and continental level. This is needed for a specific group of doctors to support the globalisation. This group of people, trainees and young psychiatrists, play a crucial role in development. Because of this we have developed the TYPAA, Trainees and Young Psychiatrists Association of Asia.

The main goals of TYPAA are to exchange ideas, interests, and information amongst colleagues throughout the Asian continent, and to organize for young psychiatrists and psychiatric trainees broad educational- and training programs ranging from social psychiatry to clinical psychiatry to basic research.

Since March 2007 the formation and plans for creating this association has started. Many Asian countries have already formed a young psychiatrist and trainees group at a national level, some even on a regional level. TYPAA will join all these groups to form a platform at a continental level to make the best use of all the knowledge and expertise of each country.

In October 2008, celebrating the 80th anniversary of the existence of the IMH (Institute of Mental Health) in Singapore, we will organize a symposium, workshops and have the first meeting of TYPAA at the Asia Pacific Psychiatric Rehabilitation Conference (APPRC).
RESIDENT ORGANIZATIONS OF NORTH AMERICA

INSTITUTIONS
1. Massachusetts General Hospital, Child Psychiatry, Boston, United States

AUTHORS
1. Abigail L. Donovan¹, Dr., MD

This presenter will discuss the structure and purpose of psychiatric resident organizations in North America, both the United States and Canada. The history and evolution of these organizations will be delineated. Further discussion will include possible future directions and goals for these organizations.

LEARNING OBJECTIVES:
To understand the history of psychiatric organizations in North America
To learn about the current structure of organizations for psychiatric residents in North America

To discuss the potential future directions for these organizations

AUTHORS
1. Amit Malik¹, Dr., MD

‘The European Federation for all Psychiatric Trainees (EFPT) is a federation of Psychiatric Trainee organisations from over 24 European Countries. It aims to improve trainee experience in Psychiatry across Europe by promoting harmonisation of training, formation of trainee organisations and exchange of ideas and trainees across the continent. It also acts as the representative body for trainees’ views at the European Union (EU) and Union of European Medical Specialists (UEMS). Currently the EFPT is actively addressing various challenges to training including training in Child and Adolescent Psychiatry, interactions with families and carers of sufferers of mental illness, Competency based training and exchange of trainees amongst various member countries. It is hoped that addressing these crucial aspect of psychiatric training will not only improve the standard of training but also raise the standard of patient care in mental health across Europe.’
FELLOWSHIP AND YOUNG PSYCHIATRIST PROGRAM: THE LATIN AMERICAN EXPERIENCE

INSTITUTIONS
1. Bolivian Catholic University, Psychiatry, Sucre, Bolivia

AUTHORS
1. Guillermo C Rivera Arroyo, Dr., MD, PhD

The Latin American Psychiatric Association [APAL] is composed of the professional psychiatric associations of 21 countries in South and Central America and the Caribbean. Together with the WPA, APAL has established the Institutional Program to Promote the Professional Development of Latin American Young Psychiatrists. One of the most important activities of this Institutional Program is to organize, conduct and evaluate fellowship and young participants programs at Latin American Congresses in Psychiatry. Substantial programs for about 100 Fellows have been organized for the past three Latin American Congresses in Psychiatry (2003, 2004 and 2005), as well for the past five Argentine Psychiatric Association Meeting, the past two Central America Psychiatric Association meetings and the Chilean Psychiatric Association Meeting (2006) and the Bolivian Psychiatric Association meeting (2005). Another large program has been organized for the XXV Latin American Congress of Psychiatry in Margarita Island.

A YOUNG PSYCHIATRISTS VIEW ON STIGMA AND BURN OUT SYNDROME (BOS)

INSTITUTIONS
1. Free University, Psychiatry, Amsterdam, The Netherlands

AUTHORS
1. Victor Ja Buwalda, Dr., MD, imsep@xs4all.nl

The WAYPT as an international democratic organization for Young Psychiatrists and Trainees (YPT) is expanding rapidly. Its aim is to connect different regions of the world and share ideas in an environment of creativity and inspiration. The WAYPT stimulates their members to work on international research-projects like STIGMA and BOS.

In his introduction Professor Norman Sartorius provides an overview on STIGMA and highlights the challenges the YPT have to be aware of. The second presentation is about the first WAYPT research-project ever, on STIGMA which aims to provide a platform for discussion and initiation of individual WAYPT members to initiate related projects as our patients have the right to lead a normal life as far as possible. We, as future leaders in psychiatry, have the task to help decreasing the pain and enhance our patients’ quality of life. We will present the planning and logistics for participation in the project.

The third presentation is about BOS. In the Netherlands recently research on BOS had been done among Psychiatric residents. BOS affects YPTs and it is important is to know what can be done to avoid such BOS. The European Young Psychiatrists and Trainees have carried out a research-project on this issue. The coordinators of this European study will present the research plan and share findings.
WHAT STIGMA IS ABOUT

INSTITUTIONS

AUTHORS
1. Norman Sartorius¹, Dr., MD, PhD
2. Victor Ja Buwalda², Dr., MD

Professor Sartorius is an international authority in Psychiatry. His experience is worldwide known. We have asked him as Young Psychiatrists and Trainees to give an introduction on the issue of STIGMA as one of the initiators of the worldwide campaign against STIGMA. We as Young Psychiatrists and Trainees are the upcoming generation to follow-up on this campaign. Therefore we ask him to give us some handles so we can continue to break down the STIGMA of our patient.

YOUNG PSYCHIATRISTS AND TRAINEES CONTRIBUTING TO THE ISSUE OF COMBATING STIGMA

INSTITUTIONS

2. Nitin Gupta², Dr., MD

Stigma is taken to be a mark of disgrace that elicits negative attitudes and behavior towards and within the patient who suffers from a mental illness. Research on stigma has been focussing on behavior rather than knowledge and attitudes, but suffers from the drawback that it is primarily from the western countries. This available literature suggests that western countries have a high stigmatizing attitude. The minority of literature from developing countries reveals less evidence of stigma; being even said to be non-existent in Islamic countries. It has been pointed out and recommendations made for [1] carrying out more world wide, cross-cultural research and [2] targeting interventions at psychiatrists during their initial training and formative years in the specialty.

WAYPT is in a unique position to be able to address the above recommendations due to it being world wide in representation and also comprised of trainee and newly qualified psychiatrists. At the 160th APA Meeting, WAYPT met and formulated an outline research proposal to identify and address issues around stigma in both developing and developed countries using a questionnaire approach. We will aim to present the approach adopted, strategy outlined, research proposal developed and preliminary findings in the symposium. At the conclusion of this presentation, the participant should be able to recognize and address the issue of stigma and its impact on management of psychiatric illness in different countries and cultures, and how trainee and young psychiatrists can contribute meaningfully to the same.
BURNOUT IN PSYCHIATRIC MEDICAL RESIDENTS IN THE NETHERLANDS

INSTITUTIONS
1. Symfora Group, Psychiatry, Amersfoort, The Netherlands
2. Free University, Psychiatry, Amsterdam, The Netherlands

AUTHORS
1. Ken Tanaka, Dr., MD
2. Victor JA Buwalda, Dr., MD

Burnout during the training program of medical residents is a topic that has been debated in the last years. Medical residents are continuous overexposed to stressful and overwhelming events during their residency. The workload and stress is unavoidable. This is because of the structure and organization of their training program. On the other hand the resident is able to obtain the maximum knowledge and experience. Learning to cope with a high workload and attending courses of time-management is therefore a necessity. When the stress is in imbalance with the coping of the resident, they may develop burnout symptoms. International research concludes that emotional exhaustion and burnout symptoms are common in medical residents. Therefore it is of great importance for training hospitals to recognize and prevent burnout because this effects the quality of patient care that we have to avoid.

Method: Medical residents in psychiatry in the Netherlands were sent a questionnaire about BOS (The Utrecht Burn-Out Scale (UBOS/MBI-HHS)). This self-report questionnaire was originally developed by Maslach & Jackson and adapted and translated into Dutch.

Results: From a total of 631 medical residents in psychiatry 242 questionnaires were sent back a response of 38.4%. 23.2% met with the criteria of moderate to severe BOS. The prevalence of severe BOS and the score on emotional exhaustion is higher in medical resident working in psychiatry compared to medical resident working in other specialties.

THE EUROPEAN PSYCHIATRY RESIDENT/TRAINEE BURNOUT STUDY: PROGRESS REPORT

INSTITUTIONS
1. Milestone clinic, Psychiatry, Norwich, United Kingdom

AUTHORS
1. Julian B Beechold, Dr., MD

Aim: To determine comparative levels of job satisfaction and burnout in psychiatric resident/trainees in over 12 different European countries.

Method: An online survey questionnaire will be completed and results fed directly into an anonymised database for analysis. The technology will allow for anonymised responses whilst also allowing for follow up of non-responders. Sophisticated methodologies will be used to obtain as representative a sample as possible taking into account the large variations in local circumstances.

Results: The process of developing the study will be described, including examples of problems faced and solutions found. Preliminary results will be presented.

Discussion: This will focus on the experience of developing the study methodology and reference it to pilot studies in Croatia and other countries. Lessons learned and ongoing challenges will be analysed.

2. Lubos Janu¹, Dr., PhD, janu@fnplzen.cz
3. Th. Polak², Dr.
4. Andreas Fallgatter², Dr.

Many psychiatric diseases are associated with alterations in brain function. There are many imaging techniques to describe brain function (fMRI, SPECT, PET, NIRS). Schizophrenia is widely used model of mental illness. We would like to evaluate different techniques in three other mental disorders, their possible applications, benefits and disadvantages.

The reason for use of imaging techniques is research and effort to improve current clinical practice. The goal for both ways is to use the most precise, most considerate and most flexible technique for particular objectives. The characteristics of near-infrared spectroscopy is described in conclusion.

ALCOHOL DEPENDENCY AND IMAGING TECHNIQUES

INSTITUTIONS
1. University Hospital of Medical Faculty of Charles University in Pilsen, Psychiatric Department, Pilsen, Czech Republic

AUTHORS
1. Sylva Rackova¹, Dr., rackova@fnplzen.cz
2. Lubos Janu¹, Dr., PhD

Objectives: Alcohol abuse and alcohol dependence are very often disorders. During alcohol consumption we can find structural and functional changes in the central nervous system (CNS). Alcohol abuse influences neurotransmitter systems (especially dopamine neurotransmission in the mesolimbic system, necessary for reward mechanisms). Changes are different during acute alcohol intoxication, chronic alcohol abuse and withdrawal, relapse of abuse.

There is possible to examine these changes by using neuroimaging methods. Structural neuroimaging methods (computerized tomography (CT) and magnetic resonance imaging (MRI)) illustrate anatomic changes that alcohol causes in the CNS, mainly chronic alcohol consumption.

In contrast functional neuroimaging methods (such as positron emission tomography (PET), functional MRI and single photon emission computerized tomography (SPECT)) show the metabolic changes in the CNS. Functional neuroimaging methods measure changes in blood flow and metabolism in various brain regions. The second application of these methods is the detection of neurotransmitter changes.

Imaging studies have demonstrated that some changes in the CNS can be reversed by abstinence or treatment. They may help in explanation of the influence of alcohol abuse on the brain and brain metabolism and in the development of new treatment interventions (medication, psychotherapy…).

It is necessary to be aware that these methods have some limitations (application of radioligands, conditions during examinations, availability and price).

ANXIETY DISORDERS, COMORBIDITY AND IMAGING TECHNIQUES

INSTITUTIONS
1. University hospital of Medical Faculty of Charles University in Pilsen, Psychiatric department, Pilsen, Czech Republic

AUTHORS
1. Lubos Januš, Dr., PhD, janu@fnplzen.cz
2. Sylva Racková, Dr.

Background: Anxiety disorders are one of the most common mental disorders with approx 25% prevalence in the population. We have either pharmatherapeutical and/or psychotherapeutical way to influence course and relapses of anxiety disorders. The treatment still have deficiency especially in the field of residual symptoms and comorbidity. Unfortunately different anxiety disorders have many faces or more precisely pathophysiological backgrounds.

Method: Distinct anxiety disorders need different treatment modality. In spite of long-term course and need for treatment the patient prefer short and risk benzodiazepine medication. The appropriate and long-term prophylactic antidepressive treatment has unclear duration.

Results: The phase of vulnerability is hardly to define. There have been advances in our knowledge of the neurobiological basis of anxiety. It focuses on several brain structures (amygdala, locus coeruleus, hippocampus, various cortical regions) and functional interactions among brain monoamines, corticotropin releasing hormone, and hypothalamic pituitary adrenal axis.

Conclusion: Imaging techniques may improve knowledge of neurobiological basis, individualisation of therapy, reduction of residual symptoms and persistency of vulnerability period. To improve further diagnostic, treatment and evaluation procedure we can use different imaging techniques. We describe current possibilities in simulation pathological states using NIRS, fMRI, PET and SPECT techniques.

VAGUS SOMATOSENSORY EVOKED POTENTIALS - NEW DIAGNOSTIC POSSIBILITY FOR THE EARLY DIAGNOSIS OF DEMENTIAS?

INSTITUTIONS
1. University of Wuerzburg, Dept. for Psychiatry, Psychosomatics and Psychotherapy, Wuerzburg, Germany

AUTHORS
1. Th. Polak, Dr.
2. JB Langer
3. FG Metzger
4. AC Ehlis
5. Andreas Fallgatter, Dr.

Background and aims: As an early event in Alzheimer’s disease (AD), the degeneration of Vagus nuclei is discussed. Thus, assessment of Vagus nerve function could provide a means of its early detection. For this purpose, the method of Vagus somatosensory evoked potentials (VSEP) has been introduced into clinical practice. Vascular processes lack the specificity of affection of brainstem nuclei. We thus hypothesized that VSEP parameters should be different between AD and VaD.

Methods: VSEP were elicited via electrical stimulation of the cutaneous representation of the Vagus nerve in the outer ear and measured as brainstem generated far field potentials on the scalp.

Results: VSEP latencies were significantly longer in AD as compared to controls. Contrary to this, ANOVAs for the VSEP latencies and amplitudes in VaD as compared to healthy controls showed no significant main effects of the factor “diagnosis”. Likewise, preliminary results point to differences in VSEP parameters in patients with Lewy body disease and frontotemporal dementia in which differences with respect to brain stem affection can be expected.

Conclusions: Our results point to the possibility that VSEP may be used as an easy, non-invasive and cost-effective method for early detection, differential diagnosis and ongoing assessment of dementia syndromes.
NEAR-INFRARED SPECTROSCOPY (NIRS) - A PROMISING BRAIN IMAGING METHOD IN PSYCHIATRY?

INSTITUTIONS
1. University of Wuerzburg, Department of Psychiatry, Wuerzburg, Germany

AUTHORS
1. Andreas Fallgatter¹, Dr.

Background: Many psychiatric diseases are associated with alterations in brain function. This has been shown with multiple brain imaging approaches, in particular with functional Magnetic Resonance Imaging (fMRI). While fMRI is undoubtedly the imaging method with the best spatial resolution providing a neuroanatomical image of the brain within the same measurement, it’s setting is not optimal for patients with psychiatric illnesses. In particular the lying position, the fixation of the head, the extremely narrow surrounding and the loud EPI sequences are stressing for psychiatric patients and do definitely affect the results of fMRI studies.

Methods: Near-Infrared Spectroscopy (NIRS) is suitable to elegantly measure concentration changes of oxygenated and deoxygenated hemoglobin in a more natural setting than fMRI with high ecological validity.

Results: Examples for brain oxygenation changes associated with different perceptional, cognitive and emotional tasks in healthy subjects as well as patients with different psychiatric diseases will be presented.

Conclusions: Interpretations for differences in brain function between psychiatric patients and healthy controls will be offered. Advantages as well as disadvantages of NIRS (e.g. restriction to cortical brain areas, poor spatial resolution) will be discussed.

A number of explanatory randomized controlled trials published since 1980s have demonstrated the clinical efficacy of Psychoeducational Family Interventions (PFI) for schizophrenia when provided in combination with drug therapy. In recent years, there has been a shift from efficacy to effectiveness studies and great attention by the researchers in developing training programmes in these interventions for ordinary staff. In this symposium, we will provide an overview of the studies on PFI for schizophrenia which have been carried out in the last decade in routine clinical settings in Europe.

5. Thomas W Kallert
6. Miguel Xavier
7. Francisco Torres Gonzales
8. Mario Maj

Objectives: This study, promoted by the European Commission (V RTD Programme) and coordinated by the Department of Psychiatry of the Naples University in six European countries, aimed to explore: a) the possibility to provide psychoeducational intervention for schizophrenia in routine settings; b) the impact of this intervention on patients' clinical status and social functioning, and on relatives' burden, coping strategies and social network.

Methods: In each country, a leading centre selected four mental health centres whose staff received training and supervisions in psychoeducational intervention. After the training, professionals applied the intervention for one year with families of patients with schizophrenia. The programme was evaluated by assessing: a) number of treated families; b) advantages and difficulties reported by staff in the implementation phase; c) 1-year impact on treated patients and relatives.

Results: 48 professionals have been officially involved in the study and 55 families received the intervention for one year. The main advantages reported by professionals concerned clinical results and improvement of relationships with users and families. While difficulties related to the method itself decreased over time, the organisational difficulties, especially the need to conciliate the family intervention with other work obligations, were stable and consistent. Patients' symptoms and disability and family burden improved over time. Differences were detected among the six countries in advantages and difficulties reported by the trainees, and families' compliance to treatment.

Conclusions: Family psychoeducational interventions have proved to be effective in routine settings, but their implementation is limited by obstacles related to the mental health centres' organization.

FAMILY BURDEN AND RELATIVES' PARTICIPATION IN PSYCHIATRIC CARE - SOME DATA FROM SWEDEN

INSTITUTIONS
1. Psychiatric Research Centre, School of Health and Medical Sciences, Örebro University, Örebro, Sweden
2. Faculty of Health and Society, Malmö University, Malmö, Sweden

AUTHORS
1. Lars Kiellin
2. Margaretha Ostman

Objectives: Relatives of people with mental illnesses are affected in many different areas of life, and are often concerned that their ill family members might be of danger to themselves or others. The aim of this presentation is to report some results from Swedish studies of relatives focusing on stigma, family burden, participation in care, and attitudes towards coercive treatment.

Methods: In three different data collection periods in a longitudinal project, in all 455 relatives of committed and voluntarily admitted patients were interviewed, using a semi-structured questionnaire.

Results: A majority of relatives experienced psychological factors of stigma by association. Relatives' burden and participation in care were not found to be associated to violent behaviour by the patients or to the patients' diagnoses, but relatives of patients with suicide attempts scored higher on some of the burden and participation items than other relatives. Relatives reported stronger support for coercion in order to protect the patient than for easing family burden and protecting others.

Conclusion: The results indicate that relatives of psychiatric patients experience stigma by association and low participation in care, but in general support the need for compulsory psychiatric care in specific situations. However, despite a heavy burden due to the patients' mental illnesses, relatives do not primarily call for coercion in order to ease the family burden. There is a need for the psychiatric services to involve and support relatives of patients with suicidal behaviour.
PSYCHO-EDUCATIONAL INTERVENTIONS FOR FAMILIES WITH SCHIZOPHRENIC PATIENTS IN GERMANY

INSTITUTIONS
1. Department of Psychiatry and Psychotherapy, Dresden University of Technology, Dresden, Germany

AUTHORS
1. Thomas W Kallert¹
2. J Schellong¹
3. C Kulke¹
4. N Kernweiss¹
5. B Ripke¹

Objective: Although the effectiveness of psycho-educational interventions for families with schizophrenic patients has been assessed in Germany several years ago, particularly the approach of behavioural family therapy is currently not provided. Therefore, the research question if therapists having received a training programme specifically tailored to practical problems of implementing this approach will provide this therapy more frequently and effectively than therapists having been trained within a standard programme is of high relevance.

Method: 1. Random selection of (at least 4) routine mental health services from three East-German Federal States. 2. Two staff members from each service randomly assigned to one of the two training programmes (standard vs. "augmented"). 3. Continuously supervised provision of behavioural family therapy by the trainees to at least one family per trainee in their routine work situation. 4. Assessment of the treated families and of the therapists over a 12-month period using a battery of standardized instruments.

Results: 40% of the mental health services (initially selected and informed about the project) refused participation (reasons: lack of staff, time-budget for the training). Finally, 8 mental health services sent two staff members to the training programmes. 3 trainees in each group withdrew during the training/supervision period. Results on the therapy of 13 families will be presented.

Conclusion: Analyses of problems to implement the successful (e.g. in terms of re-admission rates to hospital) approach point to financial and administrative issues. Re-funding the costs for this approach and acknowledgement as training element of the residency in psychiatry are main obstacles.

DISSEMINATION OF FAMILY INTERVENTION FOR SEVERE MENTAL DISORDERS IN SPAIN

Combined psychopharmacological treatment with family interventions for relatives of patients with schizophrenia are not yet being extensively offered in routine mental health care in Spain. Issues related to case load management accounts for that, but it is partly due to the availability and content of training courses for the staff.

Objectives: a) to review empirical data and conceptual contributions accumulate until today about this kind of actions; b) to outline which variables can help and which ones hinder implementing, real and effective, of this kind of process within the protocols of daily techniques of intervention.

Method: Several Spanish mental health teams and services, after continued training and external peer supervisions (1), have jointly launched a new Net-work, named GEYFE, with the objective of offering contrasted and quality training in psychoeducative family intervention to motivated staff.

Results: Through the work of GEYFE is being possible now to estimate the extensiveness of psychoeducational interventions that are being routinely used in clinical practice. The main obstacles related to the diffusion of the intervention model but also the progressive advantage achieved are being elicited.

Conclusion: The benefits of using treatment strategies based upon controlled research evidence of their efficacy can only be replicated in routine practice if the quality of application of those strategies approximates that provided in the clinical trials.

FAMILY INTERVENTIONS FOR SCHIZOPHRENIA IN ITALY: RANDOMISED CONTROLLED TRIAL

INSTITUTIONS
1. Department of Mental Health Sciences, Royal Free and University College Medical School, London, United Kingdom
2. Department of Neurosciences and Biomedical Technologies, University of Milan - Bicocca Medical School, Milan, Italy

AUTHORS
1. Giuseppe Carra
2. Massimo Clerici

Objective: To evaluate the effectiveness of multiple group family treatment for schizophrenia.

Method: Relatives were randomly provided with an informative program (n = 50), or allocated to receive an additional support program (n = 26). Patients did not attend the program to overcome cultural and organizational implementation barriers. The 12 and 24 months clinical and family outcomes were assessed.

Results: Patients’ compliance with standard care was greater at 12 months in the more intensive behavioural management group over a control group receiving treatment as usual (n = 25). A reduction in levels of expressed emotion, significantly more frequent in those receiving the additional support program than just the informative, occurred after treatment completion. Other clinical and family outcomes did not differ. However, treatment benefits declined at 24 months, when baseline high EE was again predictive of patient’s admission and relatives were more vulnerable to objective burden. Baseline illness severity variables predicted a number of medium and long term poor clinical outcomes.

Conclusions: Although family psychoeducation has been tested in a wide range of Anglo-Saxon settings, there remains need to assess outcomes more internationally. Effective family interventions for people with schizophrenia probably require continued administration of key-elements or ongoing informal support to deal with the vicissitudes of illnesses.

YOUNG PSYCHIATRISTS TODAY IN EUROPE: PROBLEMS AND PERSPECTIVES

INSTITUTIONS
1. University of Naples SUN, Department of Psychiatry, Naples, Italy
2. Hellesdon Hospital, Norwich, United Kingdom

AUTHORS
1. Andrea Fiorillo
2. Julian N Beezhold

Models of mental health care have changed dramatically in the last few years throughout Europe. The professional identity of psychiatry is generating uncertainty and controversies about psychiatric education and training. Clinical practice, teaching and research are facing new challenges and require new and comprehensive approaches.
TOWARD A COHERENT IDENTITY OF EUROPEAN YOUNG PSYCHIATRISTS

INSTITUTIONS
1. University of Naples SUN, Department of Psychiatry, Napes, Italy

AUTHORS
1. Andrea Fiorillo

Objectives: to propose a model for a coherent identity of young psychiatrists in Europe, balancing both clinical and research competencies.

Methods: self-reported questionnaires on training needs were compiled by young psychiatrists from different European countries.

Results: several differences exist in psychiatric training in Europe, generating uncertainty and controversies about the professional identity of young psychiatrists. Length of training varies from 4 years to over 6 years; selection criteria vary between countries, and include national examination, local examination, university selection, and waiting list; in some countries, there is no selection. The move from hospital-based to community-based mental health care occurred in several countries has determined a shift in clinical practice: young psychiatrists are skilled in several pharmacological and psychosocial interventions to be provided in the community, but are less experienced in providing interventions at an hospital base. Psychotherapy is not part of training everywhere; it is voluntary in most European countries and trainees have to acquire such skills in free time and at very high cost. The need for “balancing” community-based and hospital-based mental health care needs to be specifically addressed. This reflects great variability in training programs for young European psychiatrists and differences in clinical and research skills.

Conclusions: The harmonization of training in Europe should be a priority for decision-makers, both nationally and at European level. Data on European postgraduate psychiatry training as well as a proposal for a coherent identity of European young psychiatrists will be provided.

THE YOUNG PSYCHIATRISTS PROGRAMME OF THE ASSOCIATION OF EUROPEAN PSYCHIATRISTS (AEP) - AN INNOVATIVE TOOL FOR PROFESSIONAL DEVELOPMENT

INSTITUTIONS
1. Medical School of Hannover, Department of Psychiatry, Hannover, Germany
2. Oxleas NHS Mental Health Trust, London, United Kingdom

AUTHORS
1. Iris Tatiana Calliess
2. Kai Treichel

Background: Over the past 5 years, the Association of European Psychiatrists (AEP) has developed an innovative programme for young professionals, for which the term “Young Psychiatrists Programme” was established. Young psychiatrists are defined as physicians after graduation, who are in training of the speciality of psychiatry, including psychiatrists five years after their specialization.

Aim: The initial goal of the programme was to facilitate a smooth integration of young psychiatrists into the annual European conference and to allow those rather conference-inexperienced doctors to network and to meet established leaders in their field.

Method: The programme was initiated in 2004 and due to high interest has expanded constantly and significantly. It has become an integral part of the annual conference of the AEP, with the President and other members of the Executive Committee contributing to its special sessions.

Results: The professional development of young psychiatrists is successfully supported by offering a set of highly interactive activities such as workshops, meet the expert sessions, presentations. A fellowship programme has been effectively established to support clinical and scientific excellence of young psychiatrists. A designated area - the young psychiatrists’ lounge - comprising of large space and technical equipment as well as catering, has been designed to facilitate networking in an informal atmosphere during the days of the conference.

Conclusion: Inherent is the idea of continuity and sustainability. Thus, in a world of increasing separation, rapid change and competition the YP programme contributes to existential goals of a scientific society today - community building and creation of a feeling of affiliation.

With the advent of the third millennium, healthcare in Europe faces one of its biggest challenges ever—the ageing population. The ever-increasing healthcare demands of this vulnerable age group are rapidly becoming an issue not only for mental health but for the entire public health agenda. Given the complex physical and psychological health needs that are an inevitable accompaniment of ageing, Old Age Psychiatry with its biopsychosocial approach to care is best placed to meet these contemporary and future challenges. European Young Psychiatrists of today will ultimately bear a great responsibility for this challenge of tomorrow. However, training in Old Age Psychiatry is not yet formalised across Europe. The European Federation of Trainees in Psychiatry issued a statement in 2003 supporting standardisation of training in Old Age Psychiatry and explicitly stating that all adult psychiatry trainees should have a working knowledge of the specialty of old age psychiatry. Working knowledge should include an awareness of biological, psychological and social factors involved in the prevention, causation and management of mental health challenges facing the elderly population.

Challenges for European Young Psychiatrists will be discussed and the results of a survey will be presented. The experience of the developmental process in France will be highlighted, where psychiatrists are all too aware of the slow progress made in this area and where it is planned that a specific training programme in old age psychiatry will be implemented next year.

YOUNG PSYCHIATRISTS IN THE UNITED KINGDOM: CHANGE, CHANGE AND MORE CHANGE!

INSTITUTIONS
1. Hellesdon Hospital, Norwich, United Kingdom

AUTHORS
1. Julian N Beezhold

Profound and far-reaching changes are the context for the working lives of almost 5000 Young Psychiatrists in the United Kingdom. Many of these changes reflect changes and experiences in other European Region countries. They include radical changes to appointment procedures, training programme structure and content, assessment of progress, job prospects and the role of psychiatrists. This presentation will outline and describe these changes, discuss factors driving the changes and consider the impact both now and into the future. Some specific challenges for Young Psychiatrists will be identified and explored.

BURNOUT AMONG YOUNG PSYCHIATRISTS: UNSPECIFIC OR PROFESSIONAL RISK?

INSTITUTIONS
1. University of Naples SUN, Department of Psychiatry, Naples, Italy

AUTHORS
1. Umberto Volpe
2. Andrea Fiorillo

Introduction: Burnout has been growingly acknowledged as a specific risk factor for health professionals and recent studies demonstrated that, not only it may decrease job satisfaction and motivation, but it also may seriously affect the quality of the health services provided to users. Furthermore, due to the specific emotional quality of the patient-therapist relationship, high levels of burnout are frequently reported among psychiatrists. Several factors (such as lack of experience, work isolation, lack of support by manager or colleagues, role conflicts, burden of work, work outside usual working hours, etc.) may increase the arise of negative feelings, related to burnout; although such factors seem even more relevant to early career psychiatrists, to date, no systematic studies have been conducted in this specific population.

Aims: We report here the preliminary data of a study aimed to evaluate burn-out and workplace associated conditions among young psychiatrists.

Methods: Fifty young psychiatrists were enrolled among different sites and standardized self-reported questionnaires to evaluate burnout and workplace violence syndromes were administered.

Results: The results showed moderate to high levels of burnout among young psychiatrists. Young psychiatrists working conditions may represent a major cause for concern.

Conclusions: Causative and protective factors for workplace stress among young psychiatrists need to be specifically addressed in further studies. Finally, specific intervention strategies (such as problem-solving, communication skills and team-work monitoring) have to be developed, in order to improve psychological well-being among young medical professionals.

MEETING THE DEVELOPMENTAL CHALLENGE: PUBLIC - PRIVATE PARTNERSHIP FOR MENTAL HEALTH CARE IN INDIA AND ITS IMPLICATIONS FOR THE DEVELOPING WORLD

INSTITUTIONS
1. Manobal Klinik, Psychiatry, New Delhi, India

AUTHORS
1. Rajesh Nagpal, Dr., MD, drrajeshnagpal23@gmail.com

The Indian healthcare space is dominated by private sector service providers both in terms of service utilisation and as percentage of the GDP. The District Mental Health Programme and the Indian National Mental Health Programme have limited reach. On the other hand 70% of the privately practising psychiatrists (that form about 60% of all psychiatrists in the country) are located in small towns and district headquarters.
SYNERGY FOR CHANGE: NECESSITY, FEASIBILITY AND SCOPE OF PUBLIC-PRIVATE PARTNERSHIP FOR MENTAL HEALTH CARE IN INDIA

INSTITUTIONS
1. Indian Association of Private Psychiatry, Social Security Fund, India

AUTHORS
1. Neelam Kumar Bohra

With the majority of psychiatrists and Indian mental health professionals working in the private sector, there is an urgent need for partnering between the public and private sectors as they are complimentary not competitive. This presentation analyses the nature and dynamics of the Indian mental health care space and the various service providers. It examines opportunities and identifies areas of service, training and research where such collaborative programmes can prove synergistic, leading to more organised, effective and quality services with greater reach meeting the developmental challenge in India as well as becoming a model for other developing countries.

PARTNERING FOR MENTAL HEALTH: INVOLVING STAKEHOLDERS AND EVOLVING A NATIONAL MENTAL HEALTH POLICY

INSTITUTIONS
1. Indian Association of Private Psychiatry, India

AUTHORS
1. Sunil Mittal

This presentation analysis and argues that the since private sector is an important stake holder in the Indian mental health care space, its only by partnering of sectors that mental health care can reach the people as well as lead to manpower development and enhance research. With increasing dependence on private sector in both urban and rural areas, due to poor health insurance penetration the consumers pay out of pocket for private services, yet seek them due to reasons including availability, accessibility and cost efficiency. Analysing economic and other data this presentation shows how this hitherto poorly understood and under-researched ‘unorganised’ sector has now grown and matured to become a driving force and strong channel partner for implementation of national, district and local mental health programs. Further, that in order to do so, there is a pressing need for evolving a national mental health policy with the active involvement of all stakeholders from which not just programs but laws and regulations can also flow. Important policy areas and their implications for India as well as it being a model for other countries of the developing world shall be discussed.
MAKING THE PARTNERSHIP WORK: LAWS, REGULATIONS, ETHICAL ISSUES AND CONCERNS

INSTITUTIONS
1. Indian Association of Private Psychiatry, India

AUTHORS
1. Rajesh Nagpal

With the increasing participation of private sector in healthcare, concerns have often been expressed about the quality of services, practice ethics and the regulatory and legal mechanisms in force. While governmental regulatory mechanisms sometimes take time to evolve, their implementation without causing impediment to the service provider and consumer while also protecting their rights poses a challenge by itself. These issues become more complex in the context of mental health care and the vulnerable population groups that the laws and regulations must address. Self regulation, clinical governance, standardisation of services by professional or other bodies to assure quality care, social and judicial activism are some of the ways forward, yet, of urgent importance is the involvement of all stake holders in statutory bodies and in shaping new laws and regulations. Moreover, as the private sector involvement in training and research increases, laws and guidelines to ensure educational standards as well as ethical research need better enforcement. The directions and implications for legal, regulatory as well as legislative bodies to effectively deal with these and other emerging issues in such a dynamic mental health care scenario shall be discussed.

Clinical study from Association Française des Psychiatres d’Exercice Privé (French Association of Psychiatrists in Private Practice)

Hundred French psychiatrists have given an account of their practice through clinical samples they have considered as exemplary of their way to deal with unusual or critical situations. Beyond guidelines and theoretical choices, the way for the practitioner to reshape and reappropriate to himself the therapeutical tools, the very singular way to work through a « therapeutical relation », the link that the patient has with his proper symptom, all these appear to be the keys of what is being worked. Adaptation and inventivity are the real heart of the « psychiatry for the person... »

This study, showing how the practician is involved, insisting about the re-interpretation of any technique at any time, tries to evaluate or measure the ethical dimension of the psychiatric act.
IS SCIENCE HARMFUL FOR PATIENTS?

INSTITUTIONS
1. Association Française des Psychiatres d’Exercice Privé, Paris, France

AUTHORS
1. Marie-Lise Lacas¹, Dr, mlacas@free.fr

We can’t be but delighted by medical science progress and new power over diseases. However, another power is increasing, and threatening to pervert science reliability and leading medical and psychiatric art to dead ends if not failures. It is Money Power and its valet, the marketing. Consumering rules are no ethic.

IS THERE ANOTHER WAY OF THINKING PSYCHIATRY?

INSTITUTIONS
1. Association Française des Psychiatres d’Exercice Privé, Paris, France

AUTHORS
1. Chantal Jacquié¹, Dr, jacquie.ledun@wanadoo.fr

In Istanbul 2006, the orientation of the congress was about uniqueness and universality. This shows that the singularity is a constant preoccupation.
What would be the meaning of Psychiatry, and of medical art generally speaking, if it was not at the person’s service? It would probably disappear whatever the way of working and the theoretical references.
THERAPEUTIC REPERCUSSIONS OF AN UNUSUAL INTERVENTION DURING THE COURSE OF TREATMENT

INSTITUTIONS
1. Association Française des Psychiatres d’Exercice Privé, Paris, France

AUTHORS
1. Anne Rosenberg¹, Dr, annrose@club-internet.fr

It is a question of demonstrating, in reference to a clinical case, how an intervention very different from a theoretic frame may have the-rapeutic repercussions on the evolution of a patient.

SINGULARITY: CONCEPTUALIZATION OF A PRACTICE BEYOND ETHICS THEORY

INSTITUTIONS
1. Association Française des Psychiatres d’Exercice Privé, Paris, France

AUTHORS
1. Claude Gernez¹, Dr, MD, cgernez@club-internet.fr

Drawing on a case study, this work comes back to some critical mo-ments which couldn’t be resolved with the help of the usual tech-niques.

We will first define these „singularities“. Then, we will consider the modalities of the answers elaborated by the participants. We will fi-nally see that the therapeutical intuitions and positions on which the pragmatism of their interventions relies ultimately rests on ethical considerations.
This symposium will bring together the evidence from several studies in Europe and Asia about the prescribing practices in psychiatric care, including the study conducted by an active research network, EEPsi (Eastern European Psychiatric Scientific Initiative). Strategies for improving current clinical practices in the region will be discussed.

There has been no evidence about the prescribing practice in psychiatric care in Eastern Europe. The aim of our study was to estimate the prevalence of polypharmacy and compare the pattern of prescribing across eight centres in Eastern Europe.

Methods: We conducted a survey of psychiatric patients (age ≥18) admitted to eight psychiatric hospitals in: Belgrade (Serbia), Bucharest, Iasi and Tg Mures (Romania), Strumica (Macedonia), Tirana (Albania) and Zagreb (Croatia). A total sample of 1304 patients was analyzed.

Results: Antipsychotics were prescribed to 70.4% of patients. 47% of patients received typical antipsychotics and 28% were given atypical antipsychotics. Depot medication was prescribed to 8.4% of patients. Antidepressive drugs were prescribed to 39.8% of patients. SSRI were given to 15%, non-SSRI to 9.9% and older antidepressants to 17.3% of the patients. Anxiolytic drugs were prescribed to 20.4% of patients. Benzodiazepines to 68.5% and mood stabilizers to 30.2% of patients. One third of patients received an anticholinergic drug on a regular basis. The mean number of prescribed drugs was 2.8 (SD 0.97) with 26.5% receiving two drugs, 42.10% receiving three drugs and 22.08% being prescribed four or more psychotropic drugs. Only 6.8% of patients were on monotherapy. 93% of patients with psychosis received antipsychotic treatment. Antidepressive drugs were prescribed to 80.1% of depressed patients.

Conclusions: Our study revealed high prevalence of polypharmacy across participating centres. Significant number of patients diagnosed with depression did not receive antidepressive treatment. Older generations of antipsychotics and antidepressants were more commonly prescribed than the newer drugs.
DRUG PRESCRIBING PATTERNS IN WESTERN EUROPE-
DATA FROM THE AMSP STUDY

INSTITUTIONS
1. Ludwig-Maximilians University of Munich, Psychiatric Department, Munich, Germany

AUTHORS
1. Renate Grohmann¹, Dr

Over the last decades a considerable amount of new psychotropic drugs were introduced in Europe, broadening the spectrum of available pharmacological treatment regimes. As yet data on the use of these new agents and treatment choices are scarce.

The AMSP study (Arzneimittelsicherheit in der Psychiatrie) is a drug safety program for the assessment of adverse drug reactions in psychiatric inpatients, originating in 1993. In 2008, 60 psychiatric hospitals in 5 different countries (Austria, Belgium, Germany, Hungary, and Switzerland) are participating in this program.

Methods: Data were gathered from the AMSP data base from 1994 to 2006. Data on psychotropic use were based on two reference days/year and hospital.

Results: Drastic changes have taken place over this period. Nowadays, second generation antipsychotics are used in 70-80% of patients on antipsychotics with quetiapine, olanzapine and risperidone being the most common drugs. New dual antidepressants prevail in the use of antidepressants; mirtazapine is used more frequently than other antidepressants. Antiepileptic drugs are used with increasing frequency across various psychiatric diagnoses, in particular as mood stabilizers; sodium valproate is most commonly used today. The use of psychotropic drug combinations is continually increasing. The use of more than one antidepressant/antipsychotic or combinations of antidepressants with antipsychotics has increased. The concomitant use of mood stabilizers, tranquilizers and hypnotics has also increased over the years.

Conclusion: Naturalistic prescription and safety data of psychotropics give valuable information on drug use in clinical routine and are a useful tool in estimating the risk/benefit ratio of psychopharmacotherapy

REAP (RESEARCH ON EAST-ASIAN PSYCHIATRIC PRESCRIPTION PATTERN) STUDY

REAP is international collaborative research that started in 1999 to investigate prescription patterns of psychotropic drugs and the background factors. REAP is conducted in 6 countries in East Asia (China, Hong Kong, Japan, Korea, Singapore, and Taiwan). REAP consists of 2 big categories: REAP antipsychotic (REAP AP) and REAP antidepressant (REAP-AD). REAP AP 1st is survey among inpatients with Schizophrenia. REAP AP 2nd is a follow up study, and which is now in data analysis stage. REAP AD-DC is drug centered study, and AD-PC is a patient centered study. REAP-AP 1st indicated significant variation of antipsychotic medication across the countries. Japan had a high frequency of prescribing high dose antipsychotics and polypharmacy. In REAP 2nd, the prescription rate in atypical antipsychotic drugs increased. However, one fifth of schizophrenic patients were prescribed typical antipsychotic drugs. Polypharmacy of antipsychotic drugs and coadministration of anticholinergic drugs was still popular among the Japanese psychiatrists. REAP AD-DC revealed that new generation antidepressants (SSRI were prescribed for about 70% of the cases. The rate was similar to all participating countries and regions. Antidepressants were prescribed to various diagnoses.

REAP study was made using a common research protocol and questionnaire in East Asia. The survey provided the prescription patterns of psychotropic drugs in East Asia in comparable manner. The finding will be used for the improvements of prescription of psychotropic drugs in countries and regions in East Asia.
COMPARISON OF DIAGNOSIS AND PHARMACOTHERAPY OF MENTAL DISORDERS BETWEEN GPS AND PSYCHIATRISTS IN TWO CROATIAN REGIONS

INSTITUTIONS
1. Clinical Hospital Center Zagreb, Department of Psychiatry, Zagreb, Croatia
2. General Hospital Dubrovnik, Department of Psychiatry, Dubrovnik, Croatia

AUTHORS
1. S Janovic¹, Dr
2. Maja Bajs¹, Dr
3. I Bakija², Dr

Aim of the study was to compare diagnoses of mental disorders made by general practitioners (GPs) with the diagnoses made by psychiatrists. Use of pharmacotherapy and duration of the treatment of mental disorders by GPs before psychiatric consultation were also analyzed.

Methods: Data on patients coming for the first time for psychiatric consultation at two different psychiatric departments included: diagnoses made by GPs, diagnoses made by blind psychiatrists, previous treatment by GP before coming to psychiatrists, and sociodemographic variables.

Results: There were general differences in evaluation of mental disorders, mostly regarding differentiating anxiety and depressive disorders by GPs. GPs mostly prescribed anxiolitics for any complaint regarding mental health. Use of antidepressants by GPs without psychiatric consultation was significantly low (less than 5%), and even not long enough for the first efficacy signs. Antipsychotics had never been prescribed by GPs without psychiatric consultation. 95% of the patients were prescribed some pharmacotherapy at the first psychiatric consultation. There were no significant differences between two regions regardless different academic and regional status.

Conclusion: If the need for early recognition and early treatment could be recognized as important factor of outcome of mental disorder, then it is valuable to improve awareness of diagnostic and therapeutic techniques at the point of early complaints from the patient. It would be recommendable not to work solely on education, but as well on exchanging experiences and improving willingness to deal with mental disturbances at every level of health care.

PREVALENCE OF ANTIPSYCHOTIC POLYPHARMACY AT THE UNIVERSITY PSYCHIATRIC HOSPITAL IN BELGRADE

INSTITUTIONS
1. Institute of Psychiatry, Belgrade, Serbia and Montenegro
2. Medical Faculty, Department of Pharmacology, Belgrade, Serbia and Montenegro

AUTHORS

2. Miroslava Gasovic-Jasic¹, Prof
3. Ranka Samardic², Dr
4. Maja Lakcovic¹, Dr
5. Milica Prostran², Dr

It was shown that the prevalence of antipsychotic (AP) polypharmacy was low in the year after the initiation of therapy and that polypharmacy was more common in patients with more severe mental illness (1).

The aim of the study was to analyse the prevalence of AP polypharmacy and to explore types of coexisting episodes, at the University Psychiatric Hospital in Belgrade.

A sample of 120 patients, during their 198 hospitalisations, was analysed. The prevalence of polypharmacy was calculated as the proportion of patients receiving two or more APs concomitantly, minimum 28 days. Total daily AP drug load was calculated via defined daily doses of drugs per patient per day. Comparison between patients receiving monotherapy and patients receiving polypharmacy was made.

Results: Minority of patients during 32.3% hospitalisations (n = 64) had one AP, while polypharmacy was noted in majority (n = 134). Polypharmacy was evident during 63.6% hospitalisations with two and 4.1% hospitalisations with three drugs. Patients' sociodemographic characteristics were not significantly different between those who had monotherapy versus others, but patients on monotherapy had significantly more prior hospitalisations (t = 3.94, df = 119, p < 0.001).

Conclusion: The prevalence of polypharmacy in our sample is higher than the prevalence observed in developed European countries. Antipsychotic polytherapy as well as the types of AP combined may reflect clinician responses to particular symptom patterns and/or duration. Efficacy and safety of combinations of AP and comparison with monotherapy needs controlled trials.

MULTY-LEVEL MARKERS OF SCHIZOPHRENIA PATHOGENESIS: MULTIDISCIPLINE FAMILY INVESTIGATIONS DATA

INSTITUTIONS
1. Mental Health Research Center, Russian Federation
2. Research Institute of Psychiatry, Russian Federation

AUTHORS
1. V. Orlova
2. M. Uzbekov

Using multidiscipline approach patho-, neuropsychological, neuro-psysiological, biochemical and MRI markers of schizophrenia pathogenesis and their relationships were investigated. The material included 145 schizophrenia patients’ families. Multi-level characteristics which have significant heritability and liability to schizophrenia coefficients and discriminate patients, relatives and controls, were revealed. There were established interconnections some psychological mental activity deviations with schizophrenia defect type; involvement of the insufficient brain activation and the disturbances of brain energy metabolism in pathophysiology of memory impairment; involvement of autoimmune component to FRN in frontal lobes volume decresing; the role of the disturbances of monoamine oxidases, lipid peroxidation activities, albumin functional state, increase in the level of endotoxic molecules in endogenous intoxication, MRI- characteristics of atrophic process and neurodevelopment anomalies. Separate correlations as well as morphofunctional systems of studied multi-level characteristics in patients and relatives were defined. The data support unitary model of schizophrenia summarizing mechanisms of aberrant neurodevelopment and degenerative process.

MULTIDIMENSIONAL NEUROPSYCHOLOGICAL CHARACTERISTICS OF CORTICAL-SUBCORTICAL BRAIN ZONES IN FAMILIES OF PATIENTS WITH SCHIZOPHRENIA

INSTITUTIONS
1. Mental Health Research Center, Russian Federation

AUTHORS
1. N. Korsakova
2. N. Tscherbakova

To study neuropsychological characteristics of cortical-subcortical brain zones 59 schizophrenia patients families (193 subjects: 59 patients, 109 parents and 25 siblings) and 23 controls were examined. Neuropsychological Luria’s scheme was used. Functional peculiarities of subcortical, subcortical-frontal, subcortical-temporal, subcortical-parietal-occipital zones of left and right hemispheres were studied by parameters of memory, praxis, visual-space function, gnosia in different modalities, thinking. Integrative scores of studied parameters were analyzed. Statistical algorithm of Duda and Khart were used.

Results revealed a wide spectrum of higher mental functions in patients and their relatives as compared with controls varied from vague to distinct ones. The most informative for discrimination of the subject groups were interrelated characteristics of the left and right subcortical, left subcortical-frontal and left subcortical-temporal areas. The errors of discrimination between patients and controls (a low risk group) and between the low risk group and siblings (a high risk group) varied from 7 to 19%.

Obtained data indicate to a key role of impairment of mechanisms of interconnection between subcortical region and cortical associative zones (frontal and temporal) in pathogenesis of schizophrenia. They also support the significance of left-side lateralization of morphofunctional anomalies for the disease development. The revealed multidimensional neuropsychological indicators are perspective for being studied as a complex factor of genetic risk for schizophrenia.

PSYCHOLOGICAL PARAMETERS OF MENTAL ACTIVITY AS CHARACTERISTICS OF SCHIZOPHRENIC DEFECT AND SCHIZOPHRENIA RISK FACTORS

INSTITUTIONS
1. Mental Health Research Center, Russian Federation

AUTHORS
1. T. Savina
2. V. Orlova

In order to study psychological parameters of mental activity in schizophrenia patients’ families, 337 subjects were investigated (100 patients, 107 their relatives, 30 siblings and 100 controls). Characteristics of cognition (thinking, memory, attention), formal dynamic parameters (rate, tempo, ergistic parameters) and personality characteristics (emotions, communication, sociability, self-assessment, rigidity) (30 in total) were analyzed. The results demonstrated abnormalities of most of the examined characteristics in both the patients and their healthy relatives. In patients they were related to clinical types of schizophrenic defect (total and partial). Emotionality parameters, parameters “span of mediated retention”, “productivity of voluntary retention by reproduction data”, “attention switching” had high (>50%) heritability coefficients. Parameters “stability of attention under conditions of continuous concentration”, “personal anxiety level”, “reflection of unusual social groups” and “self-assessment” had medium (30 - 50%) heritability coefficients.

The data showed that both ongoing disease process and predisposition factors participate in forming of mental activity abnormalities in patients with schizophrenia. They also indicate to pathopsychological diathesis in their families and its heritability. Obtained results can be used by solving the problems of diagnostics, prognosis and social adaptation as well as in genetic consulting. In pathogenetic context the described abnormalities may be related to the impairments of subcortical frontal and subcortical temporal brain regions and their interactions.

ENDOGENOUS ENTOXICATION AS THE COMPLICATING COMPONENT OF PATHOGENETIC MECHANISMS OF SCHIZOPHRENIA

INSTITUTIONS
1. Research Institute of Psychiatry, Russian Federation

AUTHORS
1. M. Uzbekov

Aims/Objectives: Earlier we have proposed that the degree of endogenous intoxication can serve as a parameter of intensity of homeostasis disturbances in mental disorders, and particularly in schizophrenia. Endogenous intoxication (endotoxicosis) is a pathophysiological process that is characterized by the formation and accumulation in tissues and body fluids of different substances and metabolites, endotoxins in excessive concentrations or in forms that are not characteristic for the normal metabolism. Endogenous intoxication on the clinical level can reveal itself as the different complications of the main disease and as the side effects of the pharmacotherapy.

Methods: To evaluate the contribution of monoamine oxidase and semicarbazide-sensitive amine oxidase activities and serum albumin functional state, lipid peroxidation and middle-mass endotoxic molecules to the development of endogenous intoxication in schizophrenic patients. The above mentioned parameters were investigated in 77 chronic and the first-episode schizophrenic patients.

Results: There were found that patients with both studied forms of schizophrenia were characterized by the pronounced disturbances of all investigated parameters.

Conclusion: Endogenous intoxication accompanies mental disorders, and plays an important role in their pathogenetic mechanisms. Destructive processes, impairments in membrane functions, disturbances of detoxification processes and activation of catabolic reactions are the main causes of the development of endotoxicosis that leads to the disturbances of homeostasis.

This work was partially supported by the ISTC grant 3156.
ABNORMAL ELECTROPHYSIOLOGICAL PATTERNS OF BRAIN ACTIVATION DURING COGNITIVE TESTS IN SCHIZOPHRENIA

INSTITUTIONS
1. Mental Health Research Center, Russian Federation

AUTHORS
1. N. Ponomareva
2. V. Orlova

Cognitive impairment is an essential feature of schizophrenia, but its exact pathophysiological mechanisms are not clear. We studied functional brain alterations involved in cognitive disturbances in schizophrenia by monitoring brain DC potentials during word fluency and auditory verbal memory tests in 25 schizophrenic patients and in 24 age-matched normal controls. The applied noninvasive DC potentials method allows to reveal the changes of pH at the blood-brain barrier dependent on the dynamics of brain energy metabolism (Fokin and Ponomareva, 2003, 2004).

Schizophrenic patients showed moderate verbal fluency impairment relative to the normal controls. In the patients the magnitude of positive shifts of DC potentials during the word fluency test was reduced in temporal and frontal areas reflecting insufficient increase of cerebral energy metabolism. The total number of words produced correlated with the magnitude of DC potentials shifts in the patients. The marked impairment in delayed recall of auditory verbal memory test was found in schizophrenia. As compared to the normal controls the patients had strikingly lower DC potentials shifts during verbal encoding and immediate retrieval.

Our findings suggest that in schizophrenic patients the insufficient brain activation and the disturbances of brain energy metabolism are involved in pathophysiology of memory impairment.

BRAIN STRUCTURE PECULIARITIES IN SCHIZOPHRENIA PATIENTS’ FAMILIES: NEURODEGENERATION AND NEURODEVELOPMENT, THE PLACE IN THE MULTI-LEVEL HIERARCHIC STRUCTURE OF MORPHOFUNCTIONAL SYSTEMS

INSTITUTIONS
1. Mental Health Research Center, Russian Federation

AUTHORS
1. V. Orlova
2. N. Efanova

For the purpose to investigate brain structure abnormalities in schizophrenia patients’ families and their interconnection with multi-level markers of disease pathogenesis 145 patients, 232 their relatives and 255 controls were examined. CT and MRI methods were used. The analysis included assessment of frontal lobes, basal ganglia, hippocampus, amygdala volumes, parameters of ventricles as well as linear and angular indices (LAI) reflecting interconnection of middle brain structures and being sensible to deviations of liquor camera.

Experimental-psychological, neuropsychological and psychiatric positive/negative disorders assessments were done. AAB Level to NGF was estimated. The results showed abnormalities of majority of studied brain structures both in patients and in relatives. The most of ventricle parameters had high (>50%) and medium (30 - 50%) heritability coefficients. Some ventricle, basal ganglia and frontal lobes parameters were considered as markers of liability to schizophrenia. Alteration of LAI was demonstrated in patients and relatives. This alteration indicates to complex nature of ventriculomegaly in schizophrenia which relates both to predisposing factors (primary hydrocephalia) and atrophic process (presumably). Correlation of AABL and frontal lobes volume decreasing was revealed only in patients.

Correlations between tomographic and clinical characteristics were medium in general. Interrelationship between severity of positive and negative disorders and tomographic characteristics was demonstrated by regression analysis. Morphofunctional systems of parameters studied in patients and relatives were defined by cluster analysis. Here, neuropsychological parameters can be considered as a link between substrate and clinical symptoms.

The data support unitary model of schizophrenia summarizing mechanisms of aberrant brain development and degenerative process.
FROM WESTERN MAINSTREAM TO A CULTURALLY DIVERSIFIED PSYCHIATRY

INSTITUTIONS
1. Nordic Network for Transcultural Psychology and Psychiatry, CPPN, Stockholm, Sweden

AUTHORS
1. Henrik Wahlberg¹, Dr, MD, henrik.wahlberg@sll.se

Many countries in Africa, Asia and Latin America have a long tradition of different forms of mental health care, diagnostic nosologies, healing, paradigms and research. These could provide useful advances to Western mainstream psychiatry.

FROM WESTERN LIMITATIONS TO THE BENEFITS OF MULTITUDE IN CULTURAL PSYCHIATRY

INSTITUTIONS

AUTHORS
1. Henrik Wahlberg¹, Dr, MD, henrik.wahlberg@sll.se
2. Mulki Mölsa², Dr, mulki.molsa@helsinki.fi

Migration has always played a role in history. Ethnic and cultural encounters increased rapidly during the colonial oppression of Africa, Asia and Latin America where the Europeans didn’t pay much attention to the mental health of the indigenous population.

Transcultural psychiatry was instead initiated Canada 1956. It has been developed mainly in Western Europe and North America. The immigrants were considered different and studied.

In many countries the immigrants are from former colonies. Immigration is a recurrence of a colonial situation. Immigrants face colonial attitudes and subordination. Communication and mutual understanding are difficult if the language, social background, hierarchic position and cultural belonging of the patients and the caregivers are very different.

The uncritical application of Western ethnocentric psychiatric concepts in Non-Western societies and among immigrant populations has resulted in an almost complete lack of an inverse view. The question is how can Psychiatry become more culturally diversified and more polyphonic?

The ethnocentric and colonial preponderance of Transcultural psychiatry - perceived as the mainstream - is well documented since decades (Kleinman, Littlewood, Kirmayer, Gaines, Nuckolls, Young, etc). This bias has unfortunately not changed, Transcultural psychiatry studies still the immigrant populations, but the impact of the predominant culture is noted, which is an improvement.

Yet there is almost a complete lack of the inverse view. Many countries the immigrants come from have a long tradition of different forms of mental health care, diagnostic nosologies, healing, paradigms and research - which could provide useful advances to mainstream psychiatry. An evidence based inverse view requires research on the European white population with methods, paradigms and by experts from the countries the immigrants come from.
(D)HIS AND (D)HAT: SEMINAL TRUTHS - HOW CULTURE BOUND IS CULTURAL PSYCHIATRY?

INSTITUTIONS
1. University College London Medical School, Cross-cultural Psychiatry, London, United Kingdom

AUTHORS
1. Sushrut Jadhav¹, Dr, Senior lecturer, s.jadhav@ucl.ac.uk

The uncritical application of western psychiatric concepts in non-western societies resulting in culturally invalid psychiatric syndromes, have been extensively documented. Such instances are considered 'category errors'. In contrast, 'reverse category errors' although theoretically postulated, have never been empirically demonstrated.

Diagnostic criteria of an established South Asian culture specific neurosis, DhaŻt syndrome, were deployed by a psychiatrist of South Asian origin, amongst 47 white Britons in London, UK, presenting for the first time with a clinic diagnosis of ICD-9 Depressive Neurosis (Dysthymic Disorder, ICD-11). The procedure yielded a new disorder, Semen Retention Syndrome.

Based on narrative accounts and quantitative scores on the Hamilton Depression Rating Scale, the evidence suggests that a significant subset of white British subjects diagnosed with Dysthymic Disorder, may in fact be expressing a psychological variation of a previously unknown local White British somatisation phenomena labelled Semen Retention Syndrome.

Anxiety and depressive symptoms presented by this subset of subjects were primarily attributed to a core irrational belief and a cognitive error centered around misunderstood concepts of semen physiology. Consequently, the undue focus on mood idioms by both white British patients and their health professionals, leads to a mistaken diagnosis of Mood Disorder, and results in incorrect treatment.

The implications of this ethnocentric mode of reasoning raises concerns about existing concepts in psychiatric phenomenology and for official international diagnostic classificatory systems. The paper concludes by arguing that category errors in both directions are instances of cultural iatrogenesis, and underscore the importance of a culturally valid psychiatry.

FROM OPPRESSED OBJECTS TO EMPOWERED ACTORS - ISSUES IN FEMALE MENTAL HEALTH

INSTITUTIONS
1. Rigshospitalet, Centre Transcultural Psychiatry, Copenhagen, Denmark

AUTHORS
1. Marianne Kastrup¹, Consultant, MD, marianne.kastrup@rh.regionh.dk

Most societies have given women a subordinate position and many cultures still treat women as second-class citizens, under control of their fathers, brothers or husbands. Culture, traditions and beliefs allow various forms of violence against women, and war and collective violence affect the health of women disproportionately as societies subordinate women and underprioritise their life and health.

Globalization has considerable effects on women's mental health. A great challenge is to minimize its negative impacts, by e.g. enabling women to take power and control over their life and utilize the globalization process. Women's struggles for human rights have been more pronounced with regard to prevention of violence than to fulfilling their economic rights. Economic empowerment is a prerequisite for an independent, violence free existence.

The impact of women's multiple roles on their mental health may add to the stress in their lives and be linked to negative health outcomes, but multiple roles may grant benefits to women's physical and mental health. Occupying more than one role appears to buffer women from the stress.

Awareness of the particular problems of women, discrimination at home and at work, should increase if we want to stop that women continue to suffer differential treatment in the world of tomorrow.
India and other South Asian countries are psychiatrically pluralistic societies with both Western and indigenous psychiatric traditions. The latter are widely used by both urban and rural help seekers in mental disorders, usually unknown to the official mental health care.

Even in the West, viability of indigenous mental health models among immigrant populations also continues.

This presentation portrays with video clips a mini-ethnography of a family seeking help for psychiatric problems in North India. The treatment responses of both Western and indigenous practitioners on pluralistic help seeking trajectories are analyzed and compared. The mini-ethnographic documentation method provides concrete empirical material for discussing aspects of the dialectics of Western and indigenous cultural logics.

This presentation contends the implicit assumption that Western mental health professionals have real “knowledge” while patients and healers from other cultures simply have “beliefs”. It is argued that instead of reductive a priori oppositions there are needs to study concretely cultural interactions of polyphonic voices.

This symposium presents updates from Romania, Slovenia, Italy, France and the United Kingdom on recent developments in acute inpatient care. Discussion will focus on common themes and challenges and highlight different approaches.
RECENT CHANGES IN ACUTE INPATIENT CARE IN ROMANIA

INSTITUTIONS
1. University of Medicine and Pharmacy Tg Mures, Psychiatry, Tiring Mures, Romania

AUTHORS
1. Adriana Mihai, Associate Prof., MD, PhD, ammihai2002@yahoo.com

In last years in psychiatry in Romania had place multiple changes which had the purpose to improve the quality of older services or to create new services more oriented to community. Keeping in mind the differences - political, social, economical, cultural, etc. - we remark the efforts to develop psychiatry to a level comparable with others EU European countries.

This presentation will underline some of recent changes in Acute Inpatient Care. The following topics will be presented: changing in structure of services and number and qualification of personal involved in care, accessibility of acute psychiatric services, diagnostic system, changes concerning the pharmacotherapy and psychotherapy, guidelines issues, relations with National Assurance Company and estate supports, follow up procedures. Problems and proposals for improving the quality of Acute Inpatient Care will be explored and discussed.

AN INNOVATIVE APPROACH TO ACUTE INPATIENT CARE IN PARIS

INSTITUTIONS
1. EPS Erasme, France

AUTHORS
1. Cecile Hanon, Dr, MD, chanon@free.fr

This presentation describes a department that has a modern way of taking care of in-patients during crisis, in an admission unit (called UIA), with sequential stay and a different approach to what exists elsewhere in France. This is one of only 4 or 5 UIA that exist in France. The approach is almost the opposite way of the usual "community" French psychiatry care.

In particular the focus will examines the challenges and the solutions experienced in implementing and running this model of acute inpatient care.
ACUTE INPATIENT CARE IN SLOVENIA: CHANGES AND PROBLEMS

INSTITUTIONS
1. University Clinical Centre Maribor, Psychiatry, Maribor, Slovenia

AUTHORS
1. Arijana Turcin, Dr, MD, arijana7@yahoo.com
2. Blanka K Plesnicar, Prof., MD, PhD

In Slovenia, there are 5 independent psychiatric hospitals and one department of psychiatry at University Clinical Centre Maribor (UCCM). These 6 facilities offer acute psychiatric inpatient care. Department of psychiatry at UCCM has relocated in October 2005 from an old castle in the rural environment to a brand new facility that was built only for psychiatric purposes in the city centre. In the past few years, some substantial changes in organisation of care were applied to this department, inpatient care was upgraded, and department's functions were expanded with new educational programmes. This will be presented with a point that these changes were applied only in UCCM but not in the other psychiatric facilities in the country. Additionally, some problems concerning acute inpatient care in Slovenia as a whole will be offered for debate.

COERCIVE MEASURES IN ACUTE INPATIENT CARE IN ITALY

INSTITUTIONS
1. University of Naples SUN, Psychiatry, Naples, Italy

AUTHORS
1. Andrea Fiorillo, Associate Prof., MD, PhD, anfioril@tin.it
2. Umberto Volpe, Dr, MD, PhD

Coercive measures represent a common clinical problem throughout Europe, since they are applied with heterogeneity across the different European countries.

Aim: To provide a comprehensive review of past and current implementation of coercive measures in Italy.

Methods: Literature review (cross-referencing in PubMed, Embase, and Index Medicus) concerning the application of coercive measures in Italy. Description of the past and current regulations as well as of the routine implementation of coercive measures in Italy has been also empirically summarized.

Results: The Italian 1978 reform law on mental health care clearly established that medical treatment and tests are mainly voluntary. Only under special circumstances, the medical authority can order a patient involuntary admission and the physician is obliged to provide necessary tests and medical treatment.

However, even if coercive measures are usually placed without patient’s consent, the first objective should remain to protect patient’s interest and rights, in accordance to the Italian Constitution. In Italy, there are no officially recognised protocols on coercive measures for acute inpatient care and each psychiatric ward adopts its own rules and internal norms.

Conclusions: In Italy, patients with aggressive or dangerous behaviours are approached by the staff according to a “de-escalating” model, in which physical and mechanical restraint should be adopted only when any other therapeutic options previously failed. Proposals aimed to improve the implementation of coercive measures in clinical practice will be provided.
THE IMPACT OF CHANGES TO THE ACUTE INPATIENT CARE SYSTEM

INSTITUTIONS
1. Hellesdon Hospital, County Acute Services, Norwich, United Kingdom

AUTHORS
1. Julian Beezhold, Dr, MBChB, MRCPsych, beezhold@doctors.org.uk

Aim: To use robust outcome measure to evaluate the impact of radical changes to the way in which acute inpatient care is delivered to a catchment population of 450,000 in rural central Norfolk.

Method: Data was gathered from 2002 until end 2007 on a number of measurable factors relating to acute inpatient care. These included number of admissions, bed occupancy, length of stay, incidents of deliberate self harm, violence, absconding, and patient and staff satisfaction.

Results: Results show a dramatic impact. These included a 75% reduction in incidents of deliberate self harm and a very significant reduction in bed occupancy and length of stay.

Conclusion: The range of outcomes and the results suggest a very significant and sustained improvement in the quality of care, patient experience and cost has been achieved.

CHALLENGES IN PROVIDING PSYCHIATRIC CARE TO A SMALL CARIBBEAN POPULATION

INSTITUTIONS
1. Saba University School of Medicine, Chair, Dept of Behavioral Science, The Bottom, Saba Island, Netherlands Antilles
2. A.M. Edwards Medical Center, Emergency & Primary Care, The Bottom, Saba Island, Netherlands Antilles

AUTHORS
1. Alan Cheney, Professor, Ph.D., sabapsych@hotmail.com
2. Joke Blaauiboer, Dr., MD, jabkoot@yahoo.com
3. Naomi Wilson, Nurse

With only 1400 people on 13 sq km, the tiny Dutch Caribbean island of Saba nevertheless presents a microcosm of psychiatric disorders found in larger populations. Depression, anxiety disorders, schizophrenia, substance abuse, attention-deficit and somatoform disorders are among the conditions represented in this small and highly inter-related population. Yet historically only one or two primary care physicians served the island; no psychiatrists or psychologists practiced there until very recently. Adding to the island’s remoteness, no airline service existed until relatively recently and fishing boats provided the only medical transport during emergencies or when treatment not available on the island was required.

In this seminar, a Dutch physician, an American psychologist and a native Saban nurse will discuss the creative solutions now being employed to promote mental health and provide psychiatric care to this remote population. Speakers will share historical and demographic peculiarities of the population’s ancestry, discuss the difficulty foreign doctors have building trust and rapport among the islanders, address continuous funding and medical/pharmaceutical supply problems, and outline how the native nursing staff is being trained for handling psychiatric patients who are neighbors and often relatives. The necessity of close physician-psychologist-nurse working relationships is emphasized. Ample time will be allotted for questions and audience discussion.
INTRODUCTION: DEMOGRAPHIC AND HISTORICAL BACKGROUND OF SABA ISLAND

INSTITUTIONS
1. Saba University School of Medicine, Behavioral Science, The Bottom, Saba Island, Netherlands Antilles

AUTHORS
1. Alan Cheney¹, Dr., PhD, sabapsych@hotmail.com

Unique among all the Caribbean islands, Saba's population is of half European and half African ancestry, although many families share the two. The island’s size has led to a fairly small number of island families, who can trace their surnames back to around a half-dozen families; this phenomenon introduces medical and psychosocial challenges in itself. Despite the island’s Dutch affiliation, English is the principal language, although many recent arrivals speak Spanish almost exclusively.

Clinical depression, anxiety disorders, schizophrenia, substance abuse, conduct and learning disorders, marital discord and other psychiatric problems are amply represented in the small and highly inter-related population of Saba. Yet until five years ago, no practicing psychiatric professional resided on the island. Fortunately, today two American psychologists and two psychologically minded Dutch physicians serve the island. Yet many challenges remain in treating the population, including the difficulty foreigners have with building trust and rapport with the indigenous population and the lingering stigma of islanders receiving mental health treatment. As an introduction to the panel’s insights, various historical and demographic peculiarities of the island’s 400-plus-year history will be outlined.

CHALLENGES IN PROVIDING PSYCHIATRIC SERVICES TO A SMALL AND REMOTE CARIBBEAN POPULATION

INSTITUTIONS
1. A.M. Edwards Medical Center, Emergency & Primary Care, The Bottom, Saba Island, Netherlands Antilles

AUTHORS
1. Joke Blaauboer¹, Dr., MD, jabkoot@yahoo.com

The small island of Saba in the Dutch West Indies presents a microcosm of physical and mental disorders and the challenges of providing medical care are legion. The 14-bed island hospital is rudimentary and medications are not always consistently available. Funding sources are not always clear. Until relatively recently there was no air service to the island and only one ferry boat existed for providing medical transport in emergencies or when seeking treatment not available on the island. Even now, transportation off the island is entirely dependent on good weather conditions. Tenacity and creative solutions are required.

The few psychologists and physicians on Saba must work closely together to provide comprehensive care to patients in need of psychiatric treatment. Each has a critical and complementary role in recognizing the signs of mental and emotional distress in residents and in determining the correct diagnosis and treatment of a distressed patient. When physician and psychologist works well together, each patient has available the full range of pharmacotherapeutic and psychotherapeutic options. Specifics for how cooperation can be created and enhanced, and special challenges for physicians and psychologists working together in a geographically remote area, will be discussed in this presentation.
NURSING CHALLENGES IN PROVIDING PSYCHIATRIC CARE TO A REMOTE CARIBBEAN POPULATION

INSTITUTIONS
1. A.M. Edwards Medical Center, Nursing, The Bottom, Saba Island, Netherlands Antilles

AUTHORS
1. Naomi Wilson¹, Nurse

Every medical team needs good nurses and this is doubly true when providing psychiatric care. Yet most nurses who practice in geographically remote areas have little if any formal training in psychiatric nursing. When working with an indigenous population, knowledgeable nurses who are from the area and of the local population can be crucial in helping patients understand the need to seek help for emotional problems as well as physical ones. Local nurses can also play an important role in helping patients overcome the social stigma of seeking psychiatric help. In this presentation, the head nurse on tiny Saba Island in the Dutch West Indies will discuss special problems nurses encounter when providing psychiatric nursing care to their fellow islanders.

KEEPING CARE COMPLETE: FAMILY CAREGIVER PERSPECTIVES ON MENTAL ILLNESS AND WELLNESS

INSTITUTIONS
1. World Federation for Mental Health, Springfield, United States
2. National Health Service - Scotland, Dundee, United Kingdom
3. EUFAMI, Salzburg, Austria

AUTHORS
1. Preston J. Garrison¹, PJGarrisonPJG@aol.com
2. Helen H. Millar², h.millar@nhs.net
3. Sigrid Steffen³, aha-salzburg@hpe.at

The disruption of a family member’s treatment for mental illness and subsequent worsening of psychiatric symptoms can have harsh financial, physical and emotional consequences for families. The World Federation for Mental Health’s Keeping Care Complete: Caregivers’ Perspectives on Mental Illness and Wellness, the first international survey of family caregivers of individuals with schizophrenia, bipolar disorder and schizoaffective disorder, reveals the devastating consequences of relapse, defined as the worsening of symptoms after apparent recovery, and sheds light on a desire among caregivers for doctors to focus on long-term care, building a cooperative relationship to promote optimal management of the needs of all parties through integrated services, rather than on managing crisis situations.

The results of the survey demonstrate the critical role that family caregivers play in today’s mental healthcare system in assisting family members to effectively manage their disorder, comply with treatment, and deal with the social, physical and emotional aspects of a serious mental illness. It also highlights the many challenges faced by families that provide primary caregiving and support to people with mental disorders. This symposium will present the results of the survey, and will provide perspectives concerning those results from the mental health professional, family caregiver, and mental health advocate viewpoint. Consideration of how the survey results can be utilized to promote mental health policy advocacy for increased support for the family caregiver role will also be a part of this symposium.
KEEPING CARE COMPLETE: AN OVERVIEW AND SUMMARY OF THE INTERNATIONAL SURVEY OF FAMILY CAREGIVERS FOR PEOPLE LIVING WITH MENTAL ILLNESSES

INSTITUTIONS
1. World Federation for Mental Health, Springfield, United States

AUTHORS
1. Preston J. Garrison, PJGarrisonPJG@aol.com

The World Federation for Mental Health (WFMH) and Eli Lilly and Company released the results of the first international survey to gain the perspective of family members and caregivers of people with serious and persistent mental illnesses - schizophrenia, schizoaffective disorder, and bipolar disorder - in Paris on September 18, 2006. The survey responses came from caregivers in Australia, Canada, France, Germany, Italy, Spain and the UK. Research into schizophrenia and bipolar disorder rarely opens a dialogue with family caregivers about their important role in the day-to-day life of their family loved ones who suffer from these two illnesses. This survey provides valuable insight into the effect that schizophrenia and bipolar disorder have on families coping with these conditions.

This presentation will provide an overview of the results of this first international survey to gain perspectives on issues and challenges facing family caregivers of people living with mental illnesses, and from a new follow-up survey of psychiatrists, present a summary of the survey results, and highlight the importance of promoting a positive working relationship between family members, healthcare professionals, and service users. The presenter will also present advocacy and public policy recommendations developed as a result of the and focusing on the need to increase supports for family caregivers and the role they play in assisting their loved ones to live with and manage their mental illness.

KEEPING CARE COMPLETE: A HOLISTIC APPROACH TO WORKING WITH INDIVIDUALS WITH SERIOUS AND PERSISTENT MENTAL ILLNESSES

INSTITUTIONS
1. National Health Service - Scotland, Dundee, United Kingdom

AUTHORS
1. Helen H. Millar, h.millar@nhs.net

Dr. Helen Millar is a consultant psychiatrist who works with adults living with a serious and persistent mental illness. Through her work, she has developed and implemented an innovative holistic approach to assisting people with mental illnesses to live effective and productive lives in the community. Dr. Millar’s presentation will provide scientific and clinical context to the Keeping Care Complete international survey of caregivers, and will discuss the results of the survey in demonstrating the critical role that family caregivers play in today’s mental healthcare system in assisting family members to effectively manage their disorder, comply with treatment, and deal with the social, physical and emotional aspects of a serious mental illness. Dr. Millar will also present information on her holistic approach to working with adults who live with mental illness.
CHALLENGES AND CONCERNS OF FAMILY CAREGIVERS FOR PEOPLE LIVING WITH MENTAL ILLNESSES: A PARENT’S PERSPECTIVE

INSTITUTIONS
1. EUFAMI, Salzburg, Austria

AUTHORS
1. Sigrid Steffen¹, aha-salzburg@hpe.at

Mrs. Sigrid Steffen is the mother of an adult son who has lived with a severe and persistent mental illness for much of his life. Based on her experiences as a primary caregiver and support person for her son, she has gained valuable insights and skills in working with and supporting a family member living with mental illness. From these experiences and lessons, she has become a knowledgeable and committed advocate who works through the EUFAMI to inform and assist other families facing similar challenges in their role as family caregivers of individuals with a mental disorder. In her presentation, Mrs. Steffen will share her personal story - and that of her son - and will provide valuable suggestions and strategies to mental health professionals who need to recognize and support the role of family caregivers. Mrs. Steffen will also speak about the importance of developing and sustaining community-based family and caregiver support organizations such as those that belong to EUFAMI and that serve an important role of reducing the sense of isolation and hopelessness experienced by many family members and caregivers dealing with the challenges they and their loved ones face because of serious mental illness.

In response to an increasing global trend to move from institutional care to community mental health services, many Asia-Pacific countries have begun to establish mental health policy and guidelines to reflect this change. While these reforms are in line with the recommendations of the World Health Report (WHO, 2001) and the WHO Mental Health Global Action Programme Plan (WHO, 2002), the sociocultural and economic factors in the Asia-Pacific countries requires culturally appropriate and local translation of contemporary community mental health models of care. Governments and service providers often face challenges in the implementation of community mental health services due to resource constraints. However, there are vast experiences in the region that can serve as valuable lessons and inspiration for future development. For change to occur in our region, it is clear that innovative, culturally sensitive and economically sustainable pathways for community treatment models need to be explored and developed. The Asia-Pacific community mental health development (APCMHD) Project facilitated by Asian Australian Mental Health (AAMH) provides resources, networking and information-sharing about community mental health reforms in the region. Currently involved in the project are high level ministries of health representatives from China, India, Indonesia, Japan, Malaysia, Cambodia, Korea, Singapore, Taiwan, Thailand, Hong Kong, Vietnam and Mongolia. Several country representatives will present their reports documenting their country’s current community mental health services and future plans for service development.

Across China, rapid and widespread developments of community mental health services have taken place. Community mental health services in China are developing according to several key principles: services should be delivered in the community where possible; services should cover all of the general population; be easily accessible, continuous/seamless and comprehensive; meet the needs of different groups of patients; be jointly implemented and supported by different departments and organizations. Commencing in 2004, the “686 Program”, led by the National Center for Mental Health, China CDC and based on the model of community mental health services used in Victoria, Australia was established to pilot community mental health services across China.

The community mental health service reform demonstration sites across China have been immensely successful. A total of 60 demonstration areas have been built in 30 provinces covering a population of 43 million people. 602 training courses have resulted in nearly 30,000 health and community staff being trained. A national computerized case database of patients with mental illness has also been built.

There are three key conclusions. Firstly, developing countries can refer to mental health service models in developed countries, and modify them to make them suitable to the current situation in their own countries. Secondly, in a country where primary mental health care or community mental health is not well developed, a psychiatric hospital led, general hospital/CDC supported, community-based model can be established. And thirdly, a national program is a very rapid way to implement a new service model to different places in a country.

CURRENT SITUATION OF COMMUNITY MENTAL HEALTH IN JAPAN

INSTITUTIONS
1. National Institute of Mental Health, National Center of Neurology and Psychiatry, Japan

AUTHORS
1. Yutaro Setoya
2. Tadashi Takeshima

The Japanese mental health system is currently undergoing reform aimed at shifting from inpatient centered treatment towards community based health, medicine and welfare. Since 2002, many national reports, laws and amendments to the existing laws have been released, and rapid changes in the mental health system have occurred.

However, there are still many issues to be solved. For example: excessive hospital beds; a shortage of community mental health services such as housing, outreach and employment services; insufficient care management and networking between services; and scarce involvement of consumers and families. But when you look into local practices in Japan, some issues are solved in certain areas which provide effective and unique practices.

In this presentation, the current situation and issues involved in mental health care in Japan are explained, and some local best practices in community mental health are introduced. We hope these practices will be informative and helpful, and have some application to other countries and regions.
DEVELOPING COMMUNITY MENTAL HEALTH SERVICES FOR THE MENTALLY ILL PEOPLE AS HUMAN RIGHT MOVEMENT

INSTITUTIONS
1. WHO Collaborating Center for Psychosocial Rehabilitation and Community Mental Health, Yongin Mental Hospital, Korea

AUTHORS
1. Tae-Yeon Hwang

Korea is quickly developing a comprehensive mental health service system in each community and the government has invested in a community-based, public mental health system rather than in an institution-based system, but the average length of stay in mental hospitals is still too long. In order to reduce the length of stay, more residential facilities are needed. However, social stigma against by many of the people in Korea makes it difficult to reintegrate people with mental disorders into the community that the government plans to develop another 10-years mental health plan, up to the year 2017. The government will develop new policy through amendment of Mental Health Act on mental health promotion to provide mental health services for general population, suicide prevention, program for substance abuse and program for people in the early stage of psychosis.

The National Human Right Commission will influence mental health service through publishing ‘National Report for the Human Right of Mentally Ill People’ in June 2009. For this report there will be surveys of mental health institutions, development of new strategies of deinstitutionalization and establishing mental health network to improve quality of care.

In order to transforming a mental health system in Korea, the government, mental health professionals, NGOs, consumers and families, and civil movement leader should come together to develop revolutionary policy to stop institutionalisation of the mentally ill patients and develop community-based mental health services.

COMMUNITY MENTAL HEALTH: THAILAND COUNTRY REPORT 2008

INSTITUTIONS
1. Department of Mental Health, Ministry of Public Health, Nonthaburi, Thailand

AUTHORS
1. M. L. Somchai Chakrabhand, Dr, MD
2. Phunnapa Kittirattanapistoon, Dr, MD
3. Suchada Sakornsatian, Ms, OTR
4. Taweesin Visanuyothin, Dr, MD

Community Mental Health (CMH) in Thailand has been developed and expanded to cover all population across lifespan. Department of Mental Health, as a government organization, is mainly responsible for the national mental health policy and strategy, knowledge and skills transfer, and academic support in mental health as well as providing specialized care in psychiatric hospitals/institutes. The mental health care includes not only psychiatric care and rehabilitation, but also covers mental health promotion and prevention. The CMH services are integrated into the health service system throughout the Ministry of Public Health infrastructure and network from the village to regional levels. The village health volunteers make up the main manpower in the community. The psychiatric hospitals/Institutes and the mental health centers have the important role to empower the local CMH network to: (1) integrate mental health into their services in collaboration with the community and (2) provide training for health personnel to strengthen and sustain the effectiveness of the CMH system. Due to the limitations of manpower and budget, there is more emphasis on human resource capacity building especially the psychiatric nursing coverage at the sub-district level. Through the national universal coverage, the mental health care cost is allocated to the respective local health facilities responsible to provide services. Furthermore, the strategic mental health plan has been implemented at the national level together with mental health indicators such as suicide rate monitoring. In the long term, CMH should be implemented through the local authority administration to meet the community needs.
COMMUNITY MENTAL HEALTH DEVELOPMENT IN MALAYSIA

INSTITUTIONS:
1. Chief Psychiatrist, Ministry of Health, Malaysia

AUTHORS
1. Dato’ Dr Suarn Singh a/l Jasmit Singh

Malaysia has taken a balanced care approach for community mental health development due to the availability of medium level of resources. The way forward is by gradually downsizing psychiatric institutions, opening up more acute psychiatric beds in general and district hospitals, assessing needs of patients and managing appropriately in the community. This is aided by a hospital based community psychiatry service which consists of provision of acute and assertive care at patient’s home, including the follow-up of “patients with high level needs”. Once the patient is stable and the level of care and needs can be downgraded, the case is discharged to the primary care setting at the Health Centre. The Health Centers are also gradually being equipped to do home visits and trace defaulters of follow-up appointments.

Self help groups and NGOs have assisted towards the direction of care in the community with trained carers, volunteers and families on managing and coping with mental illness. With the introduction of the new Mental Health Act, provision for community care by the private and government sector will be further streamlined and enhanced.

This model of community care services is being replicated, strengthened and integrated in most psychiatric settings. The general outcome is positive in reduction of hospital stay, reduced rehospitalization and increased client satisfaction and a better quality of life. This paper discusses the development of three practice models for community psychiatry care in Malaysia, namely urban, semi-urban & institutional settings.
MENTAL HEALTH SERVICES IN MONGOLIA

INSTITUTIONS:
1. Department of Mental Health, Ministry of Health, Mongolia
2. Psychiatrist, Department International, Research and Training, National Center of Mental Health, Mongolia

AUTHORS
1. G. Tsetsegdari
2. N. Altanzul

The Law of Mongolia on Mental health (2000) and National Mental Health Program (2002) emphasized reorientation of mental health care in accordance with WHO recommendations. Components addressed in the policy and plan include: developing community mental health services; developing a mental health component in primary health care; e.g. Currently, Mongolia spends 2% of its total health budget on mental health. Within the mental health budget, funding is mainly directed towards mental hospitals, accounting for 64% of all mental health expenditure.

A number of good results have been achieved in the development of community mental health services, such as the establishment of a mental health database and the introduction of psychosocial rehabilitation services. Deinstitutionalization has been gradually implemented but is not currently comprehensive.

THE MENTAL HEALTH SYSTEM IS STILL LARGELY HOSPITAL-BASED. HOWEVER, THERE ARE NOW 35 OUTPATIENT FACILITIES, SEVEN DAY CARE CENTRES AND ABOUT TWELVE RESIDENTIAL (TENT-BASED) PROGRAMMES WHICH PROVIDE OCCUPATIONAL REHABILITATION AND RESIDENTIAL SERVICES WITH SIXTY BEDS FOR PATIENTS WITH CHRONIC MENTAL ILLNESS. THERE ARE ONLY SEVENTEEN MENTAL HEALTH PROFESSIONALS PER 100,000 POPULATIONS. THERE ARE VERY FEW PSYCHIATRISTS, PSYCHOLOGISTS AND OCCUPATIONAL THERAPISTS AND NO SOCIAL WORKERS.

OUR BEST PRACTICE IS COMMUNITY-BASED DAY CENTRES IN MONGOLIAN AS GER PROJECT. THE AIM OF THE GER PROJECT IS TO GIVE PEOPLE WITH CHRONIC MENTAL ILLNESS AN OPPORTUNITY TO INCREASE THEIR SOCIAL AND LIVING SKILLS THROUGH ACTIVITIES FOCUSING ON PSYCHOSOCIAL REHABILITATION: LIFE SKILLS, SELF-CARE, COOKING AND LEISURE SKILLS (HANDICRAFT, VEGETABLE GROWING, AND OTHER VOCATIONAL TRAINING).

DRAFTING A NEW MENTAL HEALTH ACT IN EGYPT

INSTITUTIONS
1. The Behman Hospital, Cairo, Egypt
2. Cairo University, Department of Psychiatry, Cairo, Egypt
3. Abbasyia Hospital, Cairo, Egypt

AUTHORS
1. Ahmed R El-Dosoky, Dr., MRCPsych, ahmed.eldosoky@gmail.com
2. Tareck A Gawad, Dr., MD, PhD, tareckgawad@mac.com
3. Nasser F Loza, Dr., FRCPsych, nloza@behman.com
4. Moody M Zaky, Dr., MD, moody.zaky@gmail.com

The first mental health act was introduced in Year 1949 to exclusively deal with detaining those afflicted with mental disorders. The referred to law has jurisdiction only to hospitals that are authorized to admit patients against their will and that opt to be registered under the law, leaving the majority of psychiatric hospitals that opt not to register, without being subjected to its provision. This led to violate patients' rights at those hospitals that opt not to be registered.

There is no strict time frame for detention of patients and no regular checks.

The draft law has extended the scope of its applicability to all psychiatric hospitals and covered all patients that receive treatment in these hospitals- no matter whether their admission there to be voluntary or involuntary. It has set forth supervisory bodies and has made presidency of those councils, assigned to members of judicial authorities and that is done by way of guaranteeing the rights of psychiatric patients; likewise, this draft law intensified laying down accurate measures for the patients and their treatment against their wills. The draft law has determined specific periods for the stay of those patients under those measures that would limit freedom. And it also laid down as a condition, that those measures be repeated on a periodical basis.

DEPRESSION 2008: NEW KNOWLEDGE AND ITS USE IN EDUCATION

INSTITUTIONS
1. Association for the Improvement of Mental Health Programmes, Geneve, Switzerland
2. University of Louisville, School of Medicine, Louisville, United States

AUTHORS
1. Norman Sartorius
2. Allan Tasman

WPA developed its educational programme about the recognition and treatment of depression 10 years ago. The programme materials that were prepared at that time have been translated into many languages and used in many countries. WPA has now produced an updated and more comprehensive version of this programme and will concentrate on its wide distribution and use. The experience gained during the past ten years will guide WPA in this effort. Thus, major emphasis on training programmes will be placed on the acquisition of diagnostic skills and accurate assessment of the need for treatment; on adapting the programme materials to local conditions; and on the provision of expert advice as and when necessary.

A brief description of the components of the programme materials will be given during the presentation and as a handout.

REVISING THE META-STRUCTURE WE USE IN OUR CLASSIFICATION: TOWARDS DSM-5 AND ICD-11

INSTITUTIONS
1. Institute of Psychiatry, King's College, London, United Kingdom

AUTHORS
1. David Goldberg

Previous classifications have been largely based on mental disorders as they have been known to psychiatrists - most often practicing in large mental hospitals. Recent national surveys of mental disorders in the USA, UK, Holland and Australia have provided very similar information about the relationship of common mental disorders. These surveys indicate that "generalised anxiety" and the common form of depression are best thought of together, and are closely related to other forms of anxiety disorders such as panic and phobic disorders. Instead of separate classifications of affective disorders and anxiety neuroses, we may well move towards one broad group of common mental disorders called "internalising disorders", itself subdivided into anxious depression and "fear disorders". Longitudinal surveys confirm that very similar risk factors in infancy and early childhood occur in all these disorders, and genetic studies confirm that the same set of genes are responsible for anxiety states and depression, with considerable overlap with the fear disorders. Brain imaging studies complement these findings by showing that all of them share some basic disorders in central functioning, and all of them respond in some degree to treatment with SSRIs. Within the broad group of internalising disorders there are of course also important differences, so that clinicians will still need to recognise sub-varieties of internalising disorders. Differentiation within this group is likely to be largely influenced by the extent to which different disorders have different treatment needs.
Several major findings in neurobiology of mood disorders have changed the ways of psychiatrists to understand and treat patients. (1) Depression is a heterogeneous disorder with complex and multifactorial factors ranging from genes to environment. In a cohort study of children born in Dunedin, New Zealand, Caspi and his colleagues (2003) have shown that those with the homozygous long version are relatively resilient in that they tend not to develop depression even when they have experienced several stressful events. (2) Many studies have indicated that antidepressants and ECT increase neurogenesis. While acute and chronic stressors produce a down-regulation of neurogenesis, antidepressants can reverse the stress-induced down-regulation of neurogenesis, partly by increasing neurotrophic factors such as brain-derived neurotrophic factor (BDNF). (3) A number of alterations of the somatic immune system have been observed in major depression; particularly increased levels of pro-inflammatory cytokines and reduced receptor sensitivity. In addition, central cytokines are possibly involved in the pathogenesis of depression. Stress increases interleukin-1 in the rat brain. Chronic treatment with different classes of antidepressants has been reported to significantly increase the production of IL-1 receptor antagonist (IL-1ra) mRNA in specific regions of the rat brain. (4) In structural neuroimaging studies in depression, well replicated findings include an increased rate of deep white matter hyperintensities, and the smaller frontal lobe, hippocampus, cerebellum, caudate, and putamen. (5) Cerebrovascular diseases which are visualized with MRI in the deep white matter and the basal ganglia are associated with late-onset depression. The concept of vascular depression has been discussed.

Depressive disorders are common in primary care settings and even more prevalent in patients with chronic medical illnesses. In patients with existing cardiovascular disease, depression predicts morbidity and death. There is strong evidence for poor post-myocardial infarction (MI) prognosis in patients with depression or depressive symptoms. Approximately 15-20% of acute MI patients have a major depressive disorder and, as multiple longitudinal studies have shown, depression post-MI often persists. Cardiac death risk in the six months after an acute MI is approximately four times greater in patients with depression compared with post-MI nondepressed patients. In patients with cancer, the reported prevalence of major depression, up to 38% and depression spectrum syndromes, up to 58% varies significantly because of different criteria and rating scales used to define depression, different methodological approaches to the measurement of depression, and different patient populations studied. Nevertheless, quality of life and adherence to treatment are influenced in patients who have depression in the course of their cancer care. The updated WPA Educational Programme module on Depression and Physical Illness addresses major chronic medical disorders in endocrinology; pain; neurology; oncology; cardiovascular diseases; rheumatology; HIV; obstetrics/gynecology. This presentation will present an overview on the module and highlights of the relationship between depression and co-morbid medical disorders.
PART II

TRAINING GENERAL PRACTITIONERS ABOUT DEPRESSIVE DISORDERS

INSTITUTIONS
1. University of Manchester, United Kingdom

AUTHORS
1. Linda Gask
   Linda.Gask@manchester.ac.uk

Traditional experience provided in the setting of the psychiatric unit is insufficient for acquisition of the competencies required for managing depression and other common mental health problems in the primary care setting.

In some parts of the world undergraduate medical education in psychiatry may have been defective and there is a knowledge gap to close.

What psychiatrists want to teach may not be the same as what primary care workers need or want to learn about.

Unhelpful attitudes to mental health problems can be challenged in group discussion and through the acquisition of new skills.

Both general and specific skills for the recognition and management of mental health problems can be acquired using a combination of modelling, role-play and video-feedback.

Most educational programmes have not received an adequate level of evaluation.

A range of methods will be described in particular for challenging attitudes and teaching and learning specific skills.

PREVENTION OF SUICIDE RELATED TO MOOD DISORDERS: EXPERIENCE FROM RECENT EUROPEAN STUDIES

INSTITUTIONS
1. National Prevention of Suicide and Mental Ill-health at Karolinska Institutet, Stockholm (NASP)

AUTHORS
1. Danuta Wasserman

Psychiatric disorders, and especially mood disorders, are amongst the most relevant factors contributing to suicide all over the world. In addition, help seeking behaviour, access to psychiatric treatment and the public health attitude to suicide and depression are relevant associated aspects. There are several examples of awareness campaigns like the Depression Campaign in Great Britain (UK Department for International Development, DFID) Beyond Blue Campaign in Australia (The National Depression Initiative), Public relations and broad public information campaigns in German (European Alliance Against Depression, EAAD) which show that interventions targeting whole populations can improve public awareness and general recognition of depression. From the clinical perspective, General Practitioners detecting and treating depressive conditions as the principle feature of the suicidal process, can significantly lower the numbers of completed suicides, especially in females. This has been demonstrated in the Gotland (Swedish) study and studies in Kiskunhalas, Hungary. It is likely that a combination of educational programmes concerning the detection and treatment of depression as well as alcohol dependence are necessary to decrease suicidality in men (Wasserman 2001).

"Is depression in the elderly just the same as that in the younger adult?", a very frequent question asked by primary care physicians (PCPs).

This education module will attempt to pay some attention to such a question as it targets the education of PCPs.

The similarities in clinical presentation and the differences will be described and will highlight the challenges to our current classification systems of ICD-10 and DSM-IV. The place of "minor" depression, "vascular" depression, depression with medical co-morbidities requires some consideration.

The treatment challenge in psychopharmacology, electroconvulsive therapy, psychotherapy (such as CBT and IPT), treatment resistance and suicide prevalence are all important matters requiring attention and education for PCPs.

In our understanding of aetiological and/or risk factors, the role of vascular diseases contributing to the development of late life depression and its relationship to dementia have raised a fascinating debate in the literature arising from recent neuroimaging observations. Such advances in late life depression research has given it a very powerful position in the conceptual basis of the aetiology of depression and the possible prevention of both depression and dementia.

ACTUAL PROBLEMS OF STRESS RELATED DISORDERS IN RUSSIAN PSYCHIATRY

INSTITUTIONS
1. Russian Society of Psychiatrists, Russian Federation

AUTHORS
1. Valery Krasnov, Prof, MD, PhD, krasnov@mtu-net.ru

Acute stress disorder and other stress related disorders are among the most common conditions that psychiatrists and clinical psychologists as well as GP doctors encounter in modern Russia. There is a widespread problem connected with a deal of causative factors such as social transition, local military actions, terrorist acts, unemployment, difficulties with new social, national and even cultural identification of a great part of population in many regions of the country.

Mental health specialists in Russia have rich experience in rendering care to people with stress related disorders. This experience is often out of keeping with traditional conceptions of stress disorders and especially of PTSD in West European countries and the USA.
WAR-RELATED MENTAL HEALTH PROBLEMS IN PRIMARY HEALTH CARE IN CHECHEN REPUBLIC

INSTITUTIONS
1. Chechen State University, Psychiatry, Grozny, Russian Federation

AUTHORS
1. Idrisov Arbievich Idrisov, Dr., MD, PhD, idrissov@mail.ru

The most of research articles cover the narrow groups the population, such as: combatants, refugees, women, children etc. However there are less researches showing prevalence of war-related mental health disorders in the whole of population who faced long-term war actions.

Objective: The aim of this study is to determine the prevalence of the mental health problems among the population of Chechen Republic (Chr) and creating the model of assistance to people with mental health disorders.

Method: 1000 inhabitants from four regions of Chr were examined three times: 2002, 2004 and 2006. The assessment consisted of a General Health Questionnaire - 28, Symptom Check List -90-Revised, clinical semi-structured interview based upon the DSM-IV criteria.

Results: General indicators of distress according to the GHQ-28 showed a slowdown from 2002 - 86%, to 2004 - 75% and 2006 - 65%, but still remained quite high. The same indicators for the control group from the Chechen area where there were not any military actions, gave in 2004 - 44% and in 2006 - 44.5%. The acute PTSD prevalence was 31% in 2002 and 4% in 2006 but chronic PTSD is still high - 30%. According to SCL-90-R general index (GSI) consisted of 1.32 in 2004 and 1.04 in 2002 with the highest level of somatisation, anxiety and depression.

Conclusions: The organized violence forms high level of mental health disorders among the population in war area. At lack of in-time assistance such disorders transfer into chronic forms and lead to social desadaptation of personality.

SOCIAL STRESS DISORDER

INSTITUTIONS
1. Serbsky National Research Center for Social and Forensic Psychiatry, Russian Federation

AUTHORS
1. Yuri Aleksandrovsky, Prof, MD, PhD

Studying social changes influenced on mental health during the critical development periods of the society during XX century has put a lot of new psychopathologic, therapeutic and organizational problems which decision appreciably defines psychiatry «points of growth».

In 1991 on the basis of the mental health condition analysis of the population of Russia and former Soviet republics we had been put forward the concept about existence of special group of so-called social stress disorder (SSD), determined by social, economic and political situation psychogenically actual for the great amount of people. SSD is caused by disturbance of individual mental health, but it always reflects a condition of public mental health dew to specificity of the occurrence reasons which are beyond the microsocial factors.

SSD are widely spread in population of many countries while changes of the mass consciousness roots, the way of life, behavior stereotypes are taken place. In these cases trauma is stretched in time that necessary for comprehension of the event. It distinguishes such disorder from post-traumatic stress disorder and some other variants of neurotic and somatoform disorders.

It reflects the practice requirement to appreciate the developed situation and to compare the change of the social, economic and political situation, which affected millions of people, and mental health disturbances in population. It is necessary not only for the decision of the actual medical questions, but also for development the rational socially-medical references which promote improvement of the psychological climate in the society and mental health in population.
PTSD IN CHILDREN: DIAGNOSTIC CRITERIA AND CLINICAL REALITY

INSTITUTIONS
1. Moscow Research Institute of Psychiatry, Russian Federation

AUTHORS
1. Evgeny Koren

Objectives: Well-known evidence of vulnerability to extreme traumatic events among child population suggest that mental health practitioners worldwide need to be able to recognize those post-stress disorders in children that require adequate care. This study focuses on the relevance, efficacy and utility of current PTSD assessment criteria in childhood.

Method: We have examined 58 child subjects (age 3-17) suffered from extreme traumatic events according with the clinical interview based on criteria ICD-10 and DSM-4 and matched with 30 not extreme traumatically-injured children addressed to consultation. The Schedule for Affective Disorders and Schizophrenia for School Age Children (K-SADS) with a PTSD module as well as direct reports from parents, teachers and other observers were used.

Results: A number of different PTSD related symptoms revealed at whole sample of children with prevalence flash-back type over avoidance type symptoms. High-rate comorbidity with depression, anxiety, enuresis, tics, hyperactivity disorders and aggressive behavior are marked. There were also shown presence of flash-back and avoidance symptoms in the not extreme traumatically-injured children with adjustment disorders. There is some evidence that the risk of PTSDs in children increases with physical proximity to the trauma and previous trauma exposure, and it may be greater for girls than for boys.

Conclusion: Variety of symptoms not quite satisfying the requirements of PTSD are marked. Since not all children who experience a trauma will go on to develop PTSD, there is an urgent need for identification of risk factors, etiological mechanisms, pathogenesis and additional diagnostic criteria of these disorders.

DYNAMIC OF MORTALITY UNDER THE STRESS CONDITIONS IN RUSSIA AT THE END OF THE 20TH CENTURY

INSTITUTIONS
1. Moscow Research Institute of Psychiatry, Stress Related Disorders, Moscow, Russian Federation

AUTHORS
1. Dmitry Yu. Veltishchev

Aim of the study was to evaluate the correlations of the dynamics of violent (suicides and homicides) mortality rates as indicators of societal stress and mortality from some somatic disorders: circulatory system, gastric/duodenal ulcer and malignant neoplasms in male and female population in young and middle (15-55 yrs) ages in 1990-2002.

Methods: Correlative analysis of the statistical data for mortality (age-sex specific death rates per 100 000 population) derived from WHO Statistical Information System and the State Statistical Committee for 1990-2002 years.

Results: The results have shown strong agreement for the dynamics of suicides and homicides causes of death for males (25-54 age group) and females (15-45). For suicides and disorders of circulatory system the dynamics of mortality rates was in a very strong agreement in males (15-44) and in females (25-34) groups. The similar strong agreement of the dynamics of rates of homicides and disorders of circulatory system mortality for males (25-54) and females (15-54) revealed. For suicides/homicides and gastric/duodenal ulcer strong agreement of dynamics of mortality rates was for males (25-54 and 35-44). None significant correlations of the dynamics of both violent caused and neoplasms mortality rates revealed.

Conclusion: The results of the study have confirmed the stress-related hypothesis of the rapid growth of mortality from different causes of death in young and middle age groups of population of the Russian Federation in the 90s.
PSYCHOSOCIAL FACTORS OF MALADJUSTMENT AMONG STUDENTS UNDER EXAMINATION STRESS

3. Jana Evdokimova², psylab2006@yandex.ru
4. Maria Moskova³, psylab2006@yandex.ru

Objectives: Depression and anxiety have been shown to be a serious problem for university students. Study is aimed at the systematic research of personality, family and interpersonal factors of emotional disorders and daily stress among university students.

Method: 145 university students (90 male, 55 female, mean aged 17 years) were administered a test battery including Beck Depression and Anxiety Inventories, SCL-90-r, Kohn Inventory of College Students’ Recent Life Experiences, original perfectionism and hostility scales, Zommer-Fydrick Perceived Social Support Scale and originally developed Parental Family Emotional Communications’ Style Inventory. The assessment was done a week before examination period.

Results: A significant proportion of students (25%) before examination demonstrate increased depression scores, 36% demonstrate increased anxiety varying from moderate to high level. 24% subjects reveal suicidal ideations. 25% of assessed students report on increased daily stress associated with 50% chance of mental or physical illness. Students with high perfectionism and hostility indications perform significantly greater scores of depression and anxiety along with intensive daily stress. Students from highly dysfunctional families of origin and unsatisfying social support exhibit significantly greater scores of depression, anxiety and daily stress.

Conclusions: These data indicate that dysfunctional personality traits, family and interpersonal dysfunctions are associated with high daily stress and emotional disorders among first grade university students before examination.

ACUTE STRESS DISORDERS: DIAGNOSIS AND TREATMENT APPROACHES

INSTITUTIONS
1. Moscow Research Institute of Psychiatry Ministry of Health, Moscow, Russian Federation

AUTHORS
1. Rashit D. Tukaev¹, Dr., MD, tukaevrd@mtu-net.ru

We have produced complex clinical research of 221 medical rescuers. Aims of research were description of early clinic and elaboration of criteria for ASD estimation, prevention, and psychotherapy. Three clinical groups were allocated: resistant to mental stress (47%); mental reaction to stress (26 %) (depressive (13 %) and asthenic (13%)) syndromes); somatic reaction to stress (27%) (short-term somatic reactions to stress (12%), chronic somatic diseases aggravation (15%)).

The traumatic mental stress trigger mechanism presents dichotomic estimation of events by principle - "usual - unusual", based on personal world model. An event estimation as leaving for personal norms triggers stress disorder.

Two phases of ASD development are described: initial reaction; reduction/localization. The initial reaction phase includes subphases of mental stress inclusions and canalization. The inclusions sub-phase (1-5 days) characterizes development of nonspecific psychvegetative alarm symptoms. The canalization subphase (5-9 days) divides ASD population on predominantly mental and somatic type of ASD development. The reduction/localization phase (2-5 weeks) characterizes reduction or further development of mental or somatic disorder.

Psychotherapeutic strategy for ASD and PTSD and their somatic equivalents must include: understanding by patient mental stress trigger mechanisms; expansion of diapason of "usual" with inclusion of traumatic events in category of "usual"; desensitization of traumatic event; treating of somatic disorders.

SOCIAL CHALLENGES IN EASTERN EUROPE PSYCHIATRY AND VULNERABILITY OF POPULATION

INSTITUTIONS
1. Moscow Research Institute of Psychiatry, Russian Federation

AUTHORS
1. Valery Krasnov¹, Prof, MD, PhD, krasnov@mtu-net.ru

During the last two decades after the collapse of the SU social transition in Eastern Europe was connected with the dramatic changes in health conditions of the population. These changes consider increased rates of suicides, common mortality, stress related disorders. At the same time, such social challenges suggest that mental health specialists should create appropriate screening and diagnostic procedures, develop new forms of aid for different groups of population and increase their professional qualification. The above mentioned issues are supposed to be discussed at this Symposium.

PATHOPSYCHOLOGICAL PECULIARITIES OF FORMATION OF SUICIDAL BEHAVIOR IN PATIENTS WITH NEUROTIC AND ENDOGENOUS DEPRESSIONS

2. Mykhaylo M. Denysenko¹, Dr., MD, mscience@kharkov.com
3. Oleksandr Ye. Kutikov¹, Dr., PhD, akutikov@ukr.net

Researches of differentiated pathopsychological mechanisms of suicidal behavior formation in depressions of a various etiology are an important problem of psychiatric theory and practice. 70 patients with neurotic depressions (F41, F43) and 70 patients with endogenous depressions (F31, F32) were examined. Methods included: the method of detection of a subjective control level; the method of an investigation of value orientations, modified by E.B. Fantalova; the method of determination of characterological personality accentuations and nervous-psychic instability; the test of detection of individual way of life; the Bass-Darky questionnaire. A predominance of explosive features in a characterological profile in patients with neurotic depressions with a suicidal risk and a predominance of psychasthenic characteristic features in patients with endogenous depressions were found out. The structure of values in patients with suicidal risk of both groups was characterized with a prevalence of private life values and a low importance of values of professional and creative self-realization, with a high internal conflictness regarding the most significant values. As concerns the ways of manifestation of aggression, patients with suicidal intentions were characterized with an accumulation of aggression inside, that reflected in prevalence of feelings of guilt in patients with neurotic depressions and feelings of offence and suspiciousness in patients with endogenous depressions. These pathopsychological peculiarities of patients with a suicidal risk it is necessary to consider as predictors of suicidal behavior and to take into account in diagnostical and preventive measures.
THE INCREASING GAP IN SUICIDE RATES BETWEEN RURAL AND URBAN AREAS: CASE OF BELARUS

INSTITUTIONS
1. Belorussian Medical Academy for the Postgraduate Training, Belarus

AUTHORS
1. Roman Evsegniev
t, Prof, MD, PhD, mental@cervus.unibel.by

Objectives: To investigate the differences in suicidal rates in rural vs. urban population of Belarus and the gap among different regions within the country and to discuss the possible reasons.

Method: Official data of suicidal rates were investigated.

Results: In the period from 1990 to 2005 in Belarus there was a dramatic rise of suicidal rates - from 18.5 in 1988 to 30.8 per 100,000 in 2005. During the last decade rapid socio-economic changes in the period of transition were traditionally suggested as a main factor contributing to increase of suicide rates in the post-soviet states. But nowadays became more and more clear two specific features of that phenomenon in Belarus: first, permanently increasing gap between rural and urban population (53.6 and 19.6 per 100,000 in 2006 accordingly) and second - very considerable gap (3-5 times and more) among different regions of the country: e.g. Vitebsk region (oblast) - 70.4 among rural population vs. 42.2 in the rural population of the Brest oblast in compare with 11.5 per 100,000 in Minsk city. It looks more unusual because for the first view there are no considerable difference in the main socio-demographic characteristics within the rural areas of our country - like the rate or depth of the recent economic changes, income rates, unemployment, divorce rates as well as alcohol consumption.

Conclusion: The probable reasons of the gap between suicide rates of the different regions within the country including religion and activities of the local mental health services are discussed in the report.

PRINCIPLES OF MENTAL HEALTH SUPPORT OF ETHNIC MINORITIES

INSTITUTIONS

The purpose: To develop a model of social and psychiatric examination of mental health of small ethnic groups of Kazakhstan for the development of the relevant psychohygienic programs.

Objective: to develop social and psychiatric approaches to improvement of the mental health of ethnic minorities on the basis of the German ethnic group.

Material: A study of non-psychiatric population of 541 members of the German ethnic group in Kazakhstan.

Methods: clinical and epidemiological (SCL-90-R, SF-12), a clinical-psychopathological (ICD-10), social, the socio-psychological (acculturation scale) questionnaires were used, and clinical and statistical methods of research.

The results and conclusions: On the basis of in-depth study of the balance of social stressors and resources relevant to the German minority in Kazakhstan, a programme to improve mental health is proposed. The main principle of the programme is the leading psychohygienic approach. The next principle is a focused activities to increase the personal resources of the members of surveyed ethnicity. Implementation of the relevant activities is suggested to be conducted by an appropriately trained specialist within ethnic cultural centres. This principle satisfies the lead psychohygienic strategy to strengthen mental health of small ethnic groups and can be easily implemented within the existing cultural programs. Up until now mental health problems of ethnic minorities were only addressed in clinical centers, or immigrant support centers, and the help was of largely consultative personal nature, but our research proposes the activities to improve personal resources within cultural centers and cover entire population groups.
TOWARDS ICD-11: NEEDS AND REQUESTS OF RUSSIAN PSYCHIATRY

INSTITUTIONS
1. Independent Psychiatric Association of Russia, Moscow, Russian Federation

AUTHORS
1. Yuri S. Savenko¹, Mr., Dr., MD, info@npar.ru
2. Liubov N. Vinogradova¹, Mrs., Dr., PhD, vinograd@npar.ru

Goal: to formulate main defects of ICD-10 and proposals for their elimination.

Method: critical analysis of ICD-10 from position of paradigmatically new, synergetic scientific methodology on the basis of half a century of clinical investigation.

Results: the main defects of ICD-10 refer to its main claims. 1. ICD-10 is not atheoretical, it reflects positivist approach and is built on purely inductive approach and statistical research of big samples, meanwhile deep study of separate patients by phenomenologically oriented authors is not less importance. As a result, "summative" and "essence" resemblance is constantly mixed up, spasmodic qualitative transitions are ignored and typologically unseparated one is quantified. Separate indices are integrated for the whole group instead of preliminary integration for each concrete patient, although without it they have absolutely different meaning. Being purely conventional instrument for statistical purposes ICD-10 excluded clinical classifications because of mechanism of "economy of efforts". 2. The statistical apparatus used for creating ICD-10 doesn't correspond to the latest achievements of taxonomy, mathematical modeling, synergetics, the theory of catastrophes and so on. 3. Destigmatization has been substituted by simple renaming and is characteristic of inconsistency: many terms including "patient" have been replaced, but term "dementia" has been intact and it is diagnosed when intellectual weakening is insignificant.

Conclusion: In ICD-11 one should prefer notion of "theoretical unprejudiced". The integration of the inductive and the phenomenological method are necessary as well as such statistical processing, which operates with phenomenologically adjusted examples and uses mathematical apparatus of synergetics.

MODERN PROBLEMS OF PROFESSIONAL PSYCHIATRIC EDUCATION IN RUSSIA

INSTITUTIONS
1. Moscow Research Institute of Psychiatry, Moscow, Russian Federation

AUTHORS
1. Alexey E. Bobrov¹, Prof., bobrov2004@yandex.ru

Social and economic process in Russia has led to changes in the medical professional education. The system of administrative allocation and control in education is being replaced with contractual relations. Governmental regulation and financing have been substantially reduced. Teaching programs were amended to take away ideological issues and to include some formerly ignored topics, such as economics and legislation of health service. But these changes didn't substantially affect organizational structure and profound content of medical professional education. Besides, negative consequences of the social crisis have enabled the decrease of teaching and scientific potential. They contributed to decline of the motivation for professional growth, bureaucratization and appearance of economic barriers. Specific difficulties that hamper professional education in psychiatry include social stigmatization, ambiguous influence of pharmacological companies, necessity to assimilate international approaches to classification and relatively new areas such as professional ethics, psychotherapy and social rehabilitation. The most important task is seen as preservation and transformation of domestic clinical experience, modernization of the original psychiatric schools and competent participation in international projects.
INTERACTION WITH THE PATIENTS IN PRIMARY CARE: NEW DEONTOLOGICAL AND ORGANIZATIONAL ASPECTS

INSTITUTIONS
1. Moscow State Institute of International Relations, Psychological Center, Moscow, Russian Federation

AUTHORS
1. Maya Kulygina, Dr, PhD, mkulygina@yandex.ru

The growth of appeals to psychiatric and psychological aid in primary care services is stated during the last years in Russia. It is the result of changes in population’s attitudes and gradual decrease of stigma regarding non-psychotic psychopathology as well as the effect of mental health preoccupation and additional opportunities of receiving such help. New psychiatric and psychotherapeutic services, counseling centers come around. Interaction between mental health professional and patient has acquired a special meaning in these conditions. The problem is that patients often can’t decide what kind of mental health professional they need. There are no clear notions on specificity and limits of competence of different professionals in social mind yet. Therefore, the first ethical duty of the specialist is to explain the most adequate approach to rendering care, to refer to other specialist if it is necessary or to suggest combining methods of therapy.

Deontological principals of interaction with patients have got not only moral value but are also of great practical significance by promoting psychotherapeutic contact and providing compliance. Advance in psychological state of the patient is achieved by such humanistic factors as empathy, hearing, non-judgemental perception and support assistance. Placing the patient in the focus of attention as well as confidentiality and professional qualification of the specialist are the main ethic conditions of efficient therapy. Appropriate interaction with the patient as one of therapy factors leads to the activation of coping behavior and prevents the patient from “falling ill” and dependency relations with mental health professional.

Initial dysphoric reaction (IDR) is neglected and hardly to diagnose adverse event of the antipsychotic (AP) treatment, correlated with D2 receptor occupancy. In spite of long-term history of the description of IDR and importance for AP adherence the diagnostic is rare. We want to offer the review of history of IDR, the importance, the clinical experience and the proposal of the diagnostic and evaluation tools.
HISTORY AND CLASSIFICATION OF INITIAL DYSPHORIC REACTION

AUTHORS
1. Pavel Mohr¹, Dr.

Since the introduction of first neuroleptics more than 50 years ago, patients have been complaining of feeling 'fuzzy or dull', being 'unable to think straight', or feeling 'like a zombie'. Broadly defined mental side effects were differentiated from the physical side effects and various terms were coined: psychotoxicity, behavioral toxicity, neuroleptic anxiety syndrome, neuroleptic anhedonia, neuroleptic-induced deficit state. However, there is a current consensus that all subjectively unpleasant experiences and responses to antipsychotics are being labeled as 'neuroleptic dysphoria' (ND). Terminology helps us to distinguish subjective response from disturbances of mood, cognition, or behavior. ND is a valid concept, defined as a self-reported feeling of dislike towards antipsychotic medication that can follow administration even a single dose of a drug. If present as an initial dysphoric reaction, ND can adversely affect compliance with treatment.

In order to confirm the presence of ND, other possible confounding factors have to be ruled out (e.g., subjective reactions to other side effects, or affective symptoms). ND can be measured using various psychometric instruments (DAI, PO MS, ROMI, SWN); ongoing research is trying to find out a neurobiological basis of the syndrome that has been traditionally linked to dopamine.

Supported by the research project MZ0002005.

IMPORTANCE OF INITIAL DYSPHORIC REACTION

INSTITUTIONS
1. University Hospital of Medical Faculty of Charles University in Pilsen, Psychiatric department, Pilsen, Czech Republic

AUTHORS
1. Lubos Janu¹, Dr., PhD
2. Sylva Rackova¹, Dr.

Background: Initial dysphoric reaction (IDR) is neglected and hardly to diagnose adverse event of the antipsychotic (AP) treatment, correlated with D2 receptor occupancy (more than 70 %) in the striatum. IDR may be evaluated as an part of the subjective extrapyramidal syndrome. The importance of IDR consists of influence of subjective well-being (quality of life), prediction of other D2 related adverse events and long-term adherence to the antipsychotic treatment (doctor-patient relationship).

Result: Since the first reports of symptoms like IDR the adherence was key argument for diagnostic of IDR. Patients presented IDR are not willing to cooperate and plan escape from the treatment procedure. In addition the frequency of IDR is not yet well determined. We know that IDR is correlated to the AP doses irrespective to the type of AP (sedative, incive or atypical). Because of indefinite diagnostic the clinical focus is limited. We should differentiate IDR from other complication of AP treatment as akinetic or postpsychotic depression or secondary negative symptoms.

Conclusion: The only way for improvement of this situation is to give more attention to the IDR (video presentation including), diagnostic enhancement and carefully selected first doses of the AP treatment.

SUBJECTIVE WELL-BEING WITH ANTIPSYCHOTIC TREATMENT

INSTITUTIONS
1. Charles University in Prague, Faculty of Medicine in Hradec Králové, and University Hospital Hradec Králové, Dpt. of Psychiatry, Hradec Králové, Czech Republic

AUTHORS
1. Jiri Masopust¹, Dr.
2. Jan Libiger¹, Dr.
3. R Köhler¹

Objectives: The factors that influence compliance with antipsychotic treatment in schizophrenia are related to the patient, the patient's environment, the attending physician, and the treatment itself. Important causes of nonadherence are adverse effects (AEs) of antipsychotics. Initial dysphoric reaction, extrapyramidal symptoms, akathisia, sexual dysfunction and obesity belong to the most frequent AEs. The patient's subjective well-being and attitude toward antipsychotic medication are considered important for compliance.

Methods: Severity of symptoms was estimated using the PANSS (Positive and Negative Symptoms of Schizophrenia) and CGI (Clinical Global Impression) scales. Self-rating Well-being Neuroleptic scale (SWN) was applied to evaluate the patients' subjective well-being. We also administered the Drug Attitude Inventory (DAI) to evaluate the attitude of the study subjects toward antipsychotic medication.

Results: Seventy-five outpatients (women N = 25) at the average age of 34.6 years (median 32 years) with the diagnosis of schizophrenia were included into the study. The patients with the most pronounced subjective well-being were in remission, treated with monotherapy, and low doses of antipsychotic drugs.

Conclusion: Subjective well-being is increasingly being accepted as a valid and important measure of antipsychotic treatment outcomes and tolerability. Meaningful way of antipsychotic treatment with minimal AEs can increase the patient's subjective well-being and compliance.

INITIAL DYSPHORIC REACTION - DIAGNOSTIC AND EVALUATION TOOLS

INSTITUTIONS
1. University Hospital of Medical Faculty of Charles University in Pilsen, Psychiatric department, Pilsen, Czech Republic

AUTHORS
1. Sylva Rackova¹, Dr., rackova@fnpplzen.cz
2. Lubos Janu¹, Dr., PhD

Objectives: Initial dysphoric reaction (IDR) is often and serious side effect of antipsychotic medication (AP). Dysphoria is subjective unpleasant experience which leads to interruption of medication and poor compliance.

We can find many descriptions of IDR. IDR is a generalized feeling of unwellness that the patient attributes to the AP. Patients develop changes in mood, motivation, emotions, concentration in the beginning of AP medication (first 48 hours). These changes persist for weeks or months. Development and intensity of IDR correlate by the rate of D2 occupancy in the striatum (critical occupancy is 70%). The “safe” D2 occupancy is between 60-70%.

IDR is possible to measure and evaluate by scales (Neuroleptic Dysphoria Scale, Dysphoric Response Index, Drug Attitude Inventory, Rating of Medication Influences, Self Well-being on Neuroleptic medications scale, Personal Evaluation of Transitions in Treatment. Scales measure the presence of dysphoria but mostly they evaluate the compliance and patients’ attitude to the medication.

We have many definitions and descriptions and scales to measure, the diagnostic criteria of IDR are still missing. IDR is often non-recognized complication because of its unspecific clinical symptoms. Patients often use the high doses of AP which impair their compliance.

PROFESSIONALISM AND PSYCHIATRY

INSTITUTIONS
1. Royal College of Psychiatrists, London, United Kingdom

AUTHORS
1. Sheila Hollins¹, Prof, ecook@rcpsych.ac.uk
2. Rachel Jenkins¹, Prof, rachel@olan.org
3. Dinesh Bhugra¹, Prof, d.bhugra@iop.kcl.ac.uk

Professionalism dates back to over a millennium ago when guilds set the standards for training and apprenticeship in Britain and the USA. The guilds controlled entry into a craft, training and standards of quality until their monopoly began to hinder the progress of capitalism. Now that the National Health Service is moving from a strong socialist base to a partial independent market economy it is an apposite time to revisit the notions of professionalism. There is little doubt that professionalism in psychiatry and in other medical specialities is under attack. Medical professionalism is linked to an occupation that regulates itself through systematic mandatory training and collegial disciplines. It has a base in technical specialised knowledge that has a service rather than profit orientation established in its code of ethics. The commitment to the patient by improving competence, access to care, and scientific knowledge are some of the key factors that the profession must take on board.

The old professionalism relied on mastery, autonomy, privilege and self regulation within which mastery suggested control, authority, power and superiority. The changes in social expectations internationally make it crucial that the profession has a look at itself and redefine its values. The „new” professionalism sees itself as a set of values, behaviours and relationships that underpin the public trust in doctors.

The focus on improving clinical services is our first priority - the core of our professional activities. This session will deal with some of the challenges and solutions.

Recently the world has experienced a number of natural disasters that have taken a toll on the most vulnerable. This symposium will discuss the experiences of working with and supporting the recovery process following the recent Disasters from the Tsunami to most recent cyclone. The need to have plans for the immediate term and the longer term effects to those who have been affected by a Disaster This symposium will discuss there area of Disaster mental health from experts who have worked in disaster recovery in the recent disasters. After working with the post Tsunami, the Kashmir earth quake, and the recent cyclones. The need for disaster response plans and operationalising of these plans to suit the regions will be discussed. Considering the lessons learnt from the Tsunami, Kashmir earthquake and the recent cyclone in Bangladesh.

The South Asian Forum International an organization spreading over the world in 18 Chapters from the West such as the US, UK, Australia, Canada, New Zealand to a number of South Asian and South East Asian regions and South Africa whose objectives are around capacity building in the Asian Region and cooperation and mutual support and training under the SAFI’s motto of Supporting Brain Circulation using the resources of the Large Asian ancestry mental health professionals in the West to return and exchange expertise in Asia and South Asia Region. This has seen an unprecedented increase in activity and cooperation within the region and beyond. This symposium will have the Chairpersons of the Chapters of India, Pakistan, Bangladesh, Sri Lanka, and Nepal discuss the directions in capacity building with in the constraints of resource shortages but with abundance of will and innovations together with enhanced teaching and training programs of the SAFI that have made the SAFI a bank of professionals with abundant will, motivation and passion, a capacity building organization for the South and South East Asian Regions of the World. Speakers will present the innovative development with locally acceptable models that has shown results in strengthening the resource basis in the region although much more is needed.

Asia which houses 65% of the world humanity has mental health that has vast needs and very limited resources. Asia also has some of the richest and the poorest in its population. The Asian Federation of Psychiatric Association launched at the World Congress at Cairo has organized the 6 zones in working with the entire Asian region in capacity building and enhancement of mental health of this continent. This symposium will present the current state of the various regions of Asia including the challenges that are foreseen. The AFPA Vice presidents representing South Asian Regional Cooperation Psychiatric Federation, The Association of South East Asian Nations Psychiatric Federation, East Asian Group, Central Asian region, West Asian region and South Asian Forum International will present the respective status of mental health and well-being in the various Asian Regions. This symposium will have presentations relating to the current position of psychiatry in the various regions and an analysis of needs and challenges. Plans and directions to achieve the required capacity building will be spelt out.
Africa and Middle East have been a region in the world where war, poverty and lack of resources, with many funds drained in weapons and politics led to many health problems and prevalence of many psychiatric disorders predominantly depression, anxiety and psychosomatic disorders, etc. A sample of which is demonstrated in the epidemiologic survey conducted by Cairo University Hospital (Kasr El Eini) in collaboration with Ministry of Health and WHO to assess the prevalence of mental disorders all over Egypt. Other surveys that were conducted in other countries like Palestine demonstrated the prevalence of PTSD among the various age groups specially children. African And Middle Eastern young psychiatrists encounter particular issues while practicing psychiatry in their countries. The economic problems, cultural and war state in some of the countries, religious beliefs and stigma to psychiatry are among many issues comprised in the survey conducted by the Egyptian Young psychiatrists and Trainees Section EYPTS to assess the difficulty and problems faced by their peers in Middle Eastern and African countries. Results of the survey and references from the updated WHO surveys in the region will be demonstrated and discussed in this presentation. Update from EYPTS and 2007/2008 activities will be reported as well.

CONTRIBUTION, CHALLENGE, OR THREAT? DUTCH PSYCHIATRISTS’ ATTITUDES AND OPINIONS TOWARD PHARMACEUTICAL PROMOTION

Introduction: This qualitative study seeks to contextualize the interaction between pharmaceutical promotion and psychiatrists and to contribute to the available – mostly quantitative – literature.

Method: 26 Dutch psychiatrists, residents included, were selected based on a purposive sampling method and interviewed using an in–depth semi–structured technique. The respondents’ accounts were then analyzed in accordance with the critical theoretical perspective in medical anthropology.

Findings: Pharmaceutical promotion often appeals to the psychiatrists’ unconscious selves, influencing their decisions and prioritization in prescribing. Channels of promotional influence are extremely diverse, innovative, and often intense. Rational prescription is viewed as maintaining a proper combination of introspection, knowledge, and criticality towards the ‘why–ness’ of prescribing medicines. However, uncritical colleagues are believed to be dominant among the Dutch psychiatrists. The perceived conflict of interest due to the influence of promotion is conceptualized differently. Conservative psychiatrists view it as a threat, thus hesitate to interact with the industry while those who call themselves liberal keep cautious communication. Psychopharmaceuticals are principally viewed as not efficacious well enough. This pharmacodynamic uncertainty is often astutely redirected in promoting new products with claimed lesser side effects. Simultaneously, the inherent “newer–is–better” mindset in promotions may create an ongoing hope for more efficacious medicines to come.

Conclusion: The extent of the influence of pharmaceutical promotion has been progressively moving beyond compelling advertisements. Whether this influence is conceptualized as a contribution, challenge, or threat to psychiatric practice, a slight paranoia derived from the critical scrutiny of the dynamics of promotion seems to be reasonable to prevent inappropriate prescribing.

3. Robert Chapman2, Dr, MRCPath
4. David Rouse3, Dr, MRCPath
5. Benjamin Swift2, Dr, MRCPath
6. Nathaniel Cary2, Dr, MRCPath

Introduction: Brainstem haemorrhage is common in cases of head injury when it is associated with space–occupying lesion and increases in the intracranial pressure (duret haemorrhage), in cases of diffuse axonal injury (in dorso–lateral quadrant) and diffuse vascular injury (in the periventricular tissue). However focal traumatic brainstem injury is rare (Firsching et al. Neurological Research; 2002 (24) 145–146).

Material and method: We identified 11 cases of focal traumatic brainstem injury from review of 321 case of head injury. The head trauma had been caused by from different mechanisms of complex fall from height and assaults. 9/11 are associated with skull fracture, 10/11 with contre coup contusions in the frontal and temporal lobes, 4/11 direct contusions to cerebellum, 4/11 haemorrhage in corpus callosum and 2/11 have gliding contusions. None of the case had pathological evidence of increased in the intracranial pressure. The bleeding in the pons was at the edge in 2/11 and cross the section in 9/11. The majority of patients were unconscious immediately after the incident (9/11) and 7/11 died within one day.

Conclusion: Focal traumatic brainstem injury occurs most likely due to direct impact at the back of the head or stretching forces affecting the brainstem in cases of complex fall from height and after assault, particularly those associated with kicks. It is a serious and commonly fatal brain damage, which needed to be differentiated from other causes of brain stem haemorrhages.

IS IQ IN CHILDHOOD ASSOCIATED WITH SUICIDAL THOUGHTS AND ATTEMPTS? FINDINGS FROM THE MATER UNIVERSITY STUDY OF PREGNANCY AND ITS OUTCOMES

INSTITUTIONS
1. University of Queensland, School of Population Health, Brisbane, Australia

AUTHORS
1. Rosa Alati1, Dr, PhD, r.alati@sph.uq.edu.au

Background: This study explores associations of IQ at age 14 with adult symptoms of suicidal thoughts and attempts at age 21.

Methods: Analysis was based on the Mater University Study of Pregnancy and its outcomes, an Australian prospective birth cohort study started in Brisbane Australia in 1981. We assessed associations with suicide thoughts, plans and attempts. We used two measures of IQ: the Raven’s Standard Progressive Matrices and the Wide Range Achievement Test.

Results: In multivariable analyses, there was an inverse association between Raven’s IQ and suicide thoughts, plans and attempts, but no strong evidence of an association between the WRAT3 and the three suicidal items.

Conclusion: specific aspects of intelligence may be associated with suicidal thoughts, plans and attempts.

METABOLIC ABNORMALITIES IN GIRLS SUFFERING FROM ANOREXIA NERVOSA

INSTITUTIONS
1. Obstetrics and Pediatrics Research Institute, Rostov–on–Don, Russian Federation
2. Medical University, Psychiatry, Rostov–on–Don, Russian Federation

AUTHORS
1. Vera Andreyeva1, Dr. MD, PhD, vandreyeva@mail.ru
2. Alexei Andreyev2, Dr., MD, PhD, a_andreyev@aaanet.ru
3. Anastasia Andreyeva3, Dr.

Aims. Studying the correlation between serum leptin and hormonal disorders in the girls with Anorexia Nervosa (AN).

Subject: three groups of girls aged 15–16. 1) Basic group – 59 AN diagnosed patients with body mass index (BMI) = 15.34+1.04; 2) comparison group – 53 patients with oligomenorrhoea and low BMI = 15.7+0.6, without AN; 3) control − 20 intact girls with BMI of 20.3+1.4.

Methods. Measuring of serum insulin, leptin, tumour necrosis factor–a (TNF–a), gonadotropines, somatotropic hormone (STH) and oestradiol by ELISA.

Results: There was revealed hypoinsulinaemia, caused by both food deficit and high levels of contrinsular agents – STH and TNF–a at the anorectic stage. Negative strong correlation between insulin and TNF–a levels was revealed. The specificity of this phenomenon for the AN anorectic stage is indicated by glucose–stimulated hyperinsulinemia in the comparison group. Hypoinsulinemia resulted in absolute hypoleptinemia and hypoestrogenia, which is proved by a strong positive correlation. BMI in the comparison group did not differ from AN, but the leptin level exceeded values of the patients with AN (p≤0.05), and did not differ from the control (p≥0.05). Therefore the leptin level in the comparison group was not associated with low BMI, and probably was determined by a higher level of oestrogens, as suggested by the results of the correlation analysis.

Conclusion: These results are supportive of an association between hypoleptinemia and hypoestrogenia, and specific disorder of the nutrition behavior; they also emphasize the lack of hypoleptinemia in immature underweight girls suffering from oligomenorrhea and relative hyperfolliculoidism.

NRR-13-01
A CLASSIFICATION OF SCHIZOPHRENIC THOUGHT DISORDER BASED ON A MULTITHREADED MODEL OF THOUGHT PROCESSES

INSTITUTIONS
1. Oxleas NHS Foundation Trust, Greenwich, London, United Kingdom

AUTHORS
1. C.P. Arun1, Dr., arunpeter@yahoo.com

Abstract Body:
Introduction: For many decades, the brain has been believed to be capable of parallel processing using multithreading. Of late, multithreading has become a popular computer programming paradigm allowing the optimum use of multiple and/or multicore processors.

Aims: The present work attempts to classify thought disorder in schizophrenia based on a model of thought processes employing multithreading.

Methods: We implemented the the model of thought processes using a programming language that allows multithreaded programming, Microsoft C# version 2008 (Microsoft Corporation, Redmond, WA). Two description engines were encoded that generate sentences in English assigned the task of describing a simple scene. Locks of these multithreaded applications were allowed. When a thread locks, another simultaneously running thread from another process was allowed to step in to generate language.

Results: Our model is capable of replicating various thought disorders occurring in schizophrenia. Interruption of various threads leads to the entire spectrum of thought disorder from tangentiality all the way to incomprehensible sounds: topic formulating thread interruption leads to tangentiality; paragraph formulating thread, to circumstantiality; sentence formulating thread, to knight's move thinking; clause formulating thread, to word salad; word selection thread, to paraphasias and neologisms and finally, interruption of the phoneme generating thread leads to the production of incoherent sounds.

Conclusions: The brain must employ the above or a very similar scheme for thought generation in health. Schizophrenic thought disorder offers a unique window on thought and language processing by the brain in health and disease.

2. Chi–Chi K Obuaya², Dr, MBBS

Brain Fag Syndrome¹ was described as a Culture–Bound Syndrome nearly half a century ago as a disorder associated with study among Africans in transitional society imbibing new educational culture. Characterised by affective, anxiety and somatic symptoms, reference to this syndrome abound in contemporary journals and textbooks.

**Objectives:** 1. To identify the etymology of the phrase „Brain Fag“ in Britain and North America. 2. To explore contextual use of the term „Brain Fag“ and if analogous to descriptions of Brain Fag Syndrome in Africa.

**Methods:** Detailed manual and electronic archival search of 18th, 19th and 20th century scientific literature and bibliography was carried out for the phrase „Brain Fag“. Analysis of contextual use and symptom profile was carried out and compared with features of the „Brain Fag Syndrome“ in current literature.

**Results:** „Brain Fag“ was described in 19th and 20th century Western scientific literature. Descriptions were similar in context and symptom pattern to the Brain Fag Syndrome. In the early 1800s and 1900s, the disorder was linked with mental exertion and „overstudy“. Idiomatic use of the phrase to communicate mental exhaustion among students and „brain workers“ predated the description of this disorder in West Africa by over a century. Use of the phrase later declined.

**Conclusion:** Brain Fag is neither time nor „culture–bound“ but has migrated as an idiom of distress over centuries.

**Aims:** This study investigated burnout and coping strategies among a sample of Iranian psychiatrists.

**Methods:** The Maslach Burnout Inventory (MBI) for assessing burnout and Ways of coping questionnaire for evaluating coping strategies were used. The questionnaires were posted for a random sample of psychiatrists who have registered in Iranian Psychiatric Association.

**Results:** A total of 87 psychiatrists were evaluated. High level of burn out was reported by 23.9% of respondents on depersonalization subscale, and 17% on personal accomplishment. The results showed that only 11% of psychiatrists had low level of depersonalization. Comparing ways of coping, it has been figured out that those psychiatrists, who reported high level of depersonalization, significantly used more wishful thinking and less detachment, encountering stressful events. Moreover, psychiatrists who reported poor personal accomplishment, significantly sought less social support, less emphasized on the positive aspects, less detached from the problem and more isolated themselves in stressful conditions.

**Conclusion:** High depersonalization and poor personal accomplishment as symptoms of burnout were relatively common in Iranian psychiatrists and associated with poor coping strategies facing stressful events.
NRR-16-01

ARE THE CHARACTERISTICS OF GENERAL PRACTITIONERS RELATED TO HOW THEY MANAGE FOR MENTAL DISEASES?

INSTITUTIONS
1. Far Eastern State Medical University, Family Medicine, Khabarovsk, Russian Federation
2. State Scientific Center of Social and Forensic Psychiatry by name of V.P. Serbsky, Epidemiological and Organisational Problems of Psychiatry, Moscow, Russian Federation

AUTHORS
1. Olga Borisovna Blagovidova, Dr, MD, olgablagovidova@yandex.ru
2. Alexander Alexandrovich Churkin, Professor, MD, churkin@formatek.ru

Aims: The aim of research is scientific and methodological foundation of the educational programme of prophylaxis and earlear diagnostics of mental disorders in primary care. The main task was to determine the relationship between general practitioners' characteristics and adequacy of their diagnostic of mental disorders and their decisions regarding mental health in primary care.

Methods: In 2005–2006 years 100 primary care doctors of Khabarovsk territory responded to a 57−item questionnaire assessing their practice and demographic characteristics, and their knowledge for prevention, diagnosis, and treatment questions for common mental disorders. They also answered questions of 6 psychological tests assessing their interpersonal relationships, achievement motivation, conflict management, level of empathy, burn−out syndrome. Above that, 700 people were examined by family doctors. 315 (45%) people showed abnormalities.

Results: In spite of the algorithm of research, including sending to regional psychiatrist, only 75 (24%) patients were sent. Tendency to diagnose mental disorders correctly was significantly associated with being in practice for shorter time, being more satisfied with practice, more achievement motivated.

Conclusion: Thus we can establish that in activity of family doctors in the villages spoken of Khabarovsk territory popular approach in the sphere of psychological health is not developed enough. In the system of professional teaching of family doctors it is necessary to stress studying the problems of psychology and psychiatry in the primary care. The research in this direction is quite necessary.

NRR-14-01

CLASSIFICATION OF RECURRENT DEPRESSION WITH SEASONAL PATTERN: A COMPARISON BETWEEN TWO DIAGNOSTIC INSTRUMENTS

INSTITUTIONS
1. University of Tromsø, Institute of Clinical Medicine, Faculty of Medicine, 9037 Tromsø, Norway

AUTHORS
1. Greta Brancaleoni, Dr., PhD, greta.brancaleoni@unn.no
2. Vidje Hansen, Dr., MD, vidje.hansen@unn.no

OBJECTIVES: To compare the performance of the Seasonal Pattern Assessment Questionnaire (SPAQ), the most commonly used tool for assigning a diagnosis of Seasonal Affective Disorder, with the Seasonal Health Questionnaire (SHQ), which uses the DSM−IV criteria for recurrent depression in primary care.

Methods: Two samples of approximately 200 medical students in Tromsø, Norway (69° north) and Ferrara, Italy (44° north), filled in both questionnaires. Prevalence of recurrent depression with seasonal pattern was calculated according to gender and latitude of living, with both instruments. Using SHQ diagnosis as the gold standard, sensitivity and specificity of the SPAQ as a diagnostic instrument was ascertained.

Results: The prevalence of depression with seasonal pattern measured by SPAQ was 12% in Norway and 14.5% in Italy, the difference was not significant. Prevalence was highest in females in both countries (Norway: males 4.2%, females 14.7%, Italy: males 2.3%, females 18.8%), but the difference was only significant in Italy (p=0.007). According to SHQ, the corresponding figures in Norway 5.9% and 7.1% (p=0.77) and in Italy 3.9% and 3% (p=0.75). The specificity of the SPAQ was 88.8% and the sensitivity was 47.3%.

Conclusion: Compared to a DSM−IV diagnosis of depression with seasonal pattern as measured by the SHQ, the SPAQ seriously overestimates the prevalence of seasonal depression, especially in women, and the sensitivity is far too low.
**Aims/Objectives:** A social gradient in the prevalence of depression is well established; social disadvantage is associated with greater risk of depression. There is, however, mixed evidence about whether social inequalities are evident in use of antidepressants. This aim of this study was to examine antidepressant use in Australia as a function of a socio-economic status.

**Methods:** Analysis of data from a large community survey conducted in Canberra and Queanbeyan in south-east Australia. The PATH Through Life Study used a narrow cohort design, surveying people from three birth cohorts (1975−1979; 1956−1960; 1937−1941). Data are from the 2nd wave of the survey conducted between 2003 and 2005, with 6715 respondents. Depression was assessed using the Patient Health Questionnaire. The survey also collected information on anti−depressant use, socio−economic circumstances and demographic characteristics.

**Results:** Antidepressant use was more common amongst respondents of lower socio−economic position measured in a variety of different ways (employment status, reliance of government welfare payments, financial hardship, educational attainment). The effect remained after controlling for age, gender and presence of depression symptoms.

**Conclusions:** The results suggest that, in Australia, socio−economic status is not a barrier to antidepressant treatment. In fact, relative to measures of need, antidepressant use is more common amongst those in more disadvantaged social circumstances. Implications in terms of the design of the Australian health system and social safety net, and the possible influence of health professional’s perceptions of patient capacity and availability of alternative treatments such as psychotherapy are discussed.

3. S. Steve Negus, Ph.D.

A high co−morbidty between clinical depression and pain has produced interest in examining the relationship between pain and depression in preclinical models. The present study examined the effects of an acute pain stimulus on the pain−stimulated behavior (writhing test), motor ability (rotarod test), and behavior in the intracranial self−stimulation paradigm (ICSS; a test used as a model of depression). Morphine’s effects on pain−associated behavior was also assessed. Sprague−Dawley rats were administered of IP lactic acid injections and/or morphine pretreatments, after which behaviour was examined. For the ICSS procedure, rats implanted with electrodes in the lateral hypothalamus were tested on a FR1 schedule of reinforcement to respond for electrical stimulation, and response rates were recorded. Acid−induced writhing and rota−rod activity were measured over 60 min and 30 min, respectively, in separate groups of animals.

Writhing, ICSS, and rota−rod activity were evaluated under baseline conditions and after treatment with lactic acid (0.32−3.2 %, IP). Writhing and ICSS were also assessed after lactic acid (0.32−3.2 %, IP) injections and morphine (1.0−10 mg/kg, IP) pretreatment. Lactic acid produced concentration−dependent suppression of ICSS and stimulation of writhing. Lactic acid produced concentration−independent decreases in rota−rod activity relative to control. Morphine alone did not alter ICSS behavior but dose−dependently prevented both Acid−induced suppression of ICSS and stimulation of writhing. The current findings suggest that acute pain produces depressive−like behaviour in the ICSS test, and morphine pretreatment effectively suppresses pain−induced ICSS behaviour. Therefore, ICSS may be a useful assay for evaluation of the affective components of pain.

COMMUNITY-BASED COGNITIVE BEHAVIORAL INTERVENTIONS FOR ADOLESCENT WOMEN

INSTITUTIONS
1. The University of Texas Health Science Center at San Antonio, Family Nursing Care/ OB/GYN, San Antonio, United States

AUTHORS
1. Jane Dimmitt Champion1, Dr., PhD, dimmitt@uthscsa.edu

Objective: There is a need for community-based, culturally sensitive, cognitive-behavioral interventions to reduce sexual risk behavior among minority adolescents for prevention of STI/HIV, unintended pregnancy and abuse. Aims include: 1) To obtain a more in-depth understanding of configurations of psychosocial and situational factors associated with high-risk sexual behavior, substance use, STI/HIV and contraceptive use among abused minority adolescent women with STI; 2) To implement a controlled randomized trial of a risk-reduction intervention consisting of small group sessions, individual counseling and support groups for this group; 3) To evaluate effects of the adolescent intervention model versus enhanced counseling for this group on high-risk sexual behavior, substance use, abuse recurrence, contraceptive use, unintended pregnancy and STI/HIV at 6 and 12 months follow-up.

Methods: Mexican- and African-American women (aged 14–18 years) with STI and history of abuse were recruited from public-health clinics. Following enrollment participants received targeted physical exams, contraception counseling and interviews including assessments for abuse, sexual risk behavior, substance use, health seeking behavior, genitourinary symptomatology and STI. Follow-up was conducted at 6 and 12 months.

Results: At study entry, participants (n=535) reported early first coitus, high numbers of partners per year sexual activity, concurrent relationships and high STI and re-infection rates. They waited to seek medical care, experienced many barriers to health care and had more pathological genitourinary symptomatology.

Conclusions: Findings differentiate abused minority adolescent women at high risk for STI/HIV, unintended pregnancy, substance use and pelvic inflammatory disease. Abuse assessment is essential in clinical management of abused adolescents with STI.

COMMON PATHOGENETICAL MECHANISMS OF ALCOHOLIC AND FOOD ADDICTION

INSTITUTIONS
1. Institute of Internal Medicine, Novosibirsk, Russian Federation

AUTHORS
1. Marina G. Chukhrova1, mba3@sibmail.ru

Objectives: to estimate the neurophysiologic mechanisms of alcoholic and food addiction.

Methods of research: We tested twenty alcoholic addicts, twenty food addicts and twenty people in the control group. The neurophysiologic tests (functional asymmetry of a brain, its visually-spatial abilities, and estimation of the right and left hemispheres participation in speech functions, reproduction of the specific speech information and definition of inversion) have been performed.

Results: The right hemisphere is active at addicts. It is expressed in good reproduction of emotional words, directed to the left ear, and impaired transfer emotional information from the right to the left hemisphere. It leads to inversion of normal interrelations of hemispheres which are active in healthy persons and to formation of the excitation center in the right hemisphere. This center starts to dominate and suppresses other inclinations. The person concentrates on the alcoholic or food experience. The existential organization of mental activity of addicts does not give into the likelihood forecast, does not install relationships of cause and effect and provides greater freedom in manipulation of information and in this connection requires smaller physiological expenses. An addict is peculiar inversion of emotional reflection.

Conclusion: addiction is such property of the person which is caused by neuropsychological mechanisms connected with domination of the right hemisphere on a background of deficiency of function of the left hemisphere. Thus, there is an infringement of the coordinated activity of hemispheres and transfer of emotional information.

Aim: Little is known about whether the long term mental health outcomes of marital problems and marital change different for mothers and their children. The aim of this paper is to prospectively examine the effects of marital quality and marital change on symptoms of depression in mothers and their children over 21 years.

Methods: A population based pregnancy cohort of 3512 mothers and 3334 of their children participating in the Mater–University of Queensland Study of Pregnancy and its Outcomes (MUSP), a study which commenced, in Brisbane, Australia in 1981. Mothers and children were followed up at birth, 6 months and 5, 14 and 21 years after the initial interview. Marital status and marital quality were assessed at 5 and 14 years. Symptoms of depression were assessed in mothers and children at 21 years using the Centre for Epidemiological Studies–Depression (CES–D).

Results: Change in the quality of a primary marital relationship from good to poor increases symptoms of depression in both mothers (+3.3) and children (+1.1). Symptoms of depression are lower if the mother moves to unpartnered status (− 1.31) however children experience an increase in depression (+ 1.30). There was a substantial increase in mothers depression (+3.9) associated with a poor reconstructed relationship but no change for children (0.68).

Conclusions: Although some marital transitions are associated with improved symptoms of depression in the mother no marital transitions were associated with improvement in depression in the children.

Aim: Few studies have prospectively examined the effect of the timing and chronicity of maternal anxiety on child attention outcomes. The aim of this paper is to examine the association between maternal anxiety from pregnancy to 5 years and child attention problems at 5 and 14 years.

Methods: Birth cohort of 4109 individuals born in Brisbane between 1981 and 1984. Self–reported measures of maternal anxiety were assessed at four time–points. Maternal reports of child attention problems using Achenbach’s Child Behaviour Checklist were assessed at 5 and 14 years.

Results: After adjusting for child age and sex, antenatal anxiety was strongly associated with persistent attention problems (OR 3.10 95% CI 1.82–5.29). Children with chronically anxious mothers were 5.96 (95% CI 3.81–9.33) times more likely to have persistent attention problems. These associations remained consistent after adjusting for potential confounders.

Conclusions: Repeated exposure to maternal anxiety increases the rate of attention problems suggesting that attention problems may partly constitute learned behaviour.

DEPRESSION TREATMENT PREDICTORS AMONG U.S. ELDERLY: SOCIOECONOMIC AND INSURANCE FACTORS

INSTITUTIONS
1. Rutgers University, Center for Education and Research on Mental Health Therapeutics, New Brunswick, NJ, United States

AUTHORS
1. Stephen Crystal, Ph.D., scrystal@rci.rutgers.edu
2. Ayse Akincigil, Ph.D., scrystal@rci.rutgers.edu
3. Michele Siegel, Ph.D., scrystal@rci.rutgers.edu

Objectives: Depression diagnosis and treatment rates have increased rapidly in the past 15 years for US elderly, but socioeconomic disparities persist. Of particular interest are effects of prescription drug coverage and its quality. We examine associations of demographic, clinical, and coverage factors with depression treatment in a large, nationally representative sample of US. elderly.

Methods: We analyzed 1992−2004 Medicare Current Beneficiary Survey data on community dwelling elderly diagnosed with depression (n=3190). Prescription drug coverage quality was measured by ratio of out−of−pocket to total prescription drug expenditures (<30% = “comprehensive” coverage). Other explanatory variables included gender, age, race/ethnicity, education, income, perceived access to care, functional impairment, disease severity, self−rated health and comorbidities.

Results: In 1999−2004, African Americans continued to have lower odds of receiving antidepressant treatment (OR=.51, CI .36−.74) as did individuals with income under 150% of poverty. There was no evidence of improvement in the gap for African Americans from the 1992−98 period, when the odds ratio for treatment was .56 (CI .34−.91). Compared to beneficiaries without pharmacy coverage, the OR for limited coverage was 1.38 (CI 1.01−1.89) and the OR for comprehensive coverage was 2.46 (CI 1.77−3.41). Other access barriers did not predict treatment. Results of models for use of any treatment (antidepressant or psychotherapy) were similar to those for antidepressant use.

Conclusions: Disparities in depression treatment persist for African American elderly diagnosed with depression. Quality of drug coverage was a strong predictor of treatment, suggesting that cost−sharing requirements can function as a significant treatment barrier.

Psychological component of gestational dominance (PCGD) and the relationships in the „Mother−and−Baby“ dyad are of the great influence in the beginnings of the disorders that are marked as F 98.2 in ICD−10. PCGD is a complex of regulatory psychological mechanisms functioning in pregnancy and changing the attitudes of an expecting woman towards herself and those around, directing to creation the specific circumstances for the development of a fetus.

Goal
To explore a correlation between the type of PCGD in pregnancy, psychosomatic disorders, and perinatal encephalopathy in early childhood

Method
Longitudinal research of 72 families with clinical and psychological methods. The formalized self−administered questionnaire was designed to answer the main research question. The primary goal of the questionnaire was to define PCGD type. The research project has been conducted in collaboration with pediatricians from polyclinics in the cities of Saint−Petersburg and Cronstadt from 2004 to 2007.

Results
Five types of PD were revealed. There were the statistically significant relationship between pathological types of PCGD and complications during pregnancy (in 68% of cases), somatic pathology in expecting women (72%), eating disorders in infancy (82%), and perinatal encephalopathy (67%). It was also found that mothers whose children weighted less than 2 kg or more than 4 kg had pathological type of PCGD in 68.5 % of cases.

Conclusion
Detection of the type of PCGD can help to reveal those expecting women who are more likely to give a birth to a child with psychosomatic disorders.

Aims: To examine reporting patterns of atypical antipsychotic–associated diabetes related events in the United States Food and Drug Administration (FDA) Adverse Event Reporting System (AERS)

Methods: An analysis of the FDA AERS was conducted for clozapine, risperidone, olanzapine, quetiapine, ziprasidone or aripiprazole with 24 diabetes−related adverse events using a Multi−item Gamma Poisson Shrinker (MGPS) data−mining algorithm. Haloperidol was included as an example of an older typical agent. Using MGPS, adjusted reporting ratios (Empiric Bayes Geometric Mean or ebGM) and 90% confidence intervals (CIs; eb05−eb95) were calculated to estimate the degree of association between drug−event combinations relative to all drugs and events in this database.

Results: All seven atypicals had an Eb05≥2 for at least one hyperglycemia−related event. The most common event was diabetes mellitus, with 2,784 cases reported. Adjusted reporting ratios (with CIs) for diabetes mellitus were: olanzapine 9.6 (9.2−10.0; 1306 cases); risperidone 3.8 (3.5−4.1; 447 cases); quetiapine 3.5 (3.2−3.9; 283 cases); clozapine 3.1 (2.9−3.3; 464 cases); ziprasidone 2.4 (2.0−2.9; 74 cases); and aripiprazole 2.4 (1.9−2.9; 71 cases). The adjusted reporting ratio for haloperidol was 2.0 (1.7−2.3; 139 cases).

Conclusions: In AERS a lower reporting of diabetes is seen for haloperidol, aripirazole and ziprasidone compared to risperidone, quetiapine, clozapine and olanzapine. Olanzapine has the highest reporting ratio for diabetes. These findings will be discussed in relation to prior epidemiological, clinical and experimental studies and their practical implications for clinicians.

Background: The mechanism of ECT has been insufficiently explained and documented so far. The elaboration of a new method allowing monitoring intracranial changes undergoing during and after ECT have allowed to eliminate these inconveniences. The investigations in changes in SAS width and intracranial pulsation amplitude by NIR−T/BSS method can throw new light on changes in type and volume induced by ECT−therapy.

Method: In this study new method of non−invasive investigation of width of SAS and intracranial pulsation parameters was used. This method has been called Near InfraRed Transillumination / Back Scattering Sounding − NIR−T/BSS. The basis of this method consists in light beam analysis in near infrared whereby the light beam is emitted by an emitting diode. The light beam passes through head’s anatomic layers, is reflected multiple times in SAS and returns outwards − to be recorded by the receiving diode. The novelty of this method is the patented invention which allows skin flow under the probe to be eliminated and thereby „to look” under the skull bone.

Results: After ECT, a highly significant increase in pulsation amplitude was observed. The pulsation amplitude rose above 2.5 times after the average time of 90 seconds since the moment ECT were administered. A pause in SAS pulsation – not longer than 26 seconds – directly after administration of electroshocks was observed. After ca. 90 seconds the amplitude decreased slowly but never returned to the initial values within the investigated period of time of 5 minutes, and this in all cases being analyzed.

DYSFUNCTIONAL PERSONALITY TRAITS IN RECURRENT DEPRESSION

INSTITUTIONS
1. Moscow Research Institute for Psychiatry, Clinical Psychology and Psychotherapy, Moscow, Russian Federation

AUTHORS
1. Natalia Garanian¹, Dr., PhD, garanian@mail.ru
2. Maria Vasilieva¹, Dr., mashgun@yandex.ru

Objectives: Many clinicians believe that dysfunctional personality traits may interfere with the treatment of depression. Treatment resistance in depressed patients is generally believed to be associated with high rate of personality disorders or dysfunctional personality traits comorbidity. However relatively little attention has been devoted to assessment of low order traits associated with treatment outcomes. Present comparative study is aimed at the exploration of low order personality traits in the groups of responders and non responders diagnosed with recurrent depression.

Methods: 30 patients meeting ICD−10 criteria of recurrent depression (with poor response to medication with antidepressants) have been compared with 30 patients of the same diagnostic category (good treatment response) on the battery of symptomatic and personality measures. Beck Depression and Anxiety Inventories, originally developed perfectionism scale and Hostility scales, SCID−II questionnaire have been administered.

Results: To the end of treatment period (of same duration for both groups) non responders exhibited higher scores on the both symptomatic measures. There was a significant difference on personality measures between compared groups. Patients with poor therapeutic outcome demonstrated significantly greater perfectionism and hostility scores in comparison with responders. Dysfunctional personality traits of „anxious−fearful” personality disorders cluster (according to operational criteria of DSM−IV) were predominant among non responders.

Conclusions: Dysfunctional personality traits are associated with poor treatment outcome in recurrent depression.

Aim: This study was conducted to see the effectiveness of fluoxetine and combined fluoxetine and cognitive behaviour therapy (CBT) for the treatment of obsessive compulsive disorder (OCD).

Methods: Thirty OCD patients were divided into two groups (Group A and Group B); each consisting of fifteen patients. Group A received capsule Fluoxetine and Group B received combined Fluoxetine and CBT. CBT consisted of thirteen weekly sessions of around one hour duration. Twenty six participants completed the study. To measure the symptom severity Dhaka University Obsessive Compulsive Scale (DUOCS) was used before treatment and at 5th, 9th, and 13th weeks (after treatment).

Results: Mean initial score of DUOCS in Group A was 46.6±16.04 and in Group B it was 36.67±12.85. Mean DUOCS score at 13th week in Group A was 28.23±12.96 and in Group B it was 18.77±6.3. Comparison of means of initial DUOCS score and 13th week score using paired t test in both the treatment groups were done. In both the groups the mean score changes were highly significant (p=0.000). Mean of Difference between 1st week and 13th week score in group A was 17.85±10.02 and in Group B was 19.31±10.56. From analysis it was seen that mean symptom reduction was more in Group B but it was not statistically significant (p=0.721). Mean of percentage of reduction of symptoms from 1st week to 13th week in Group A was 39.29±15.45 and in Group B was 48.95±13.68.

Conclusion: reduction of symptoms was also more in case of CBT+Fluoxetine group (p=0.104).

5. David R. Jacobs4, Dr., PhD
6. Daan Kromhout5, Prof. dr., PhD MPH

Objectives: Because many previous studies involved attempted suicide or have a cross-sectional or retrospective design, potential causal sociodemographic and biologic factors associated with suicidal death remain largely unknown.

Methods: Baseline data was gathered between 1957 and 1964 in 12,763 men aged 40–59 years living in the United States, Finland, the Netherlands, Italy, Croatia, Serbia, Greece, and Japan. Suicidal death and death from external causes were assessed during 40 years of follow-up. In Cox multivariable models, hazard ratios (HR) were adjusted for age, socioeconomic status, smoking, body mass index, total cholesterol, and systolic blood pressure, and stratified for country.

Results: The rates for suicidal death and death from external causes were 0.38 (n=118) and 1.01 (n=313) per 1,000 person–years, respectively. In multivariable models, HRs for suicidal death were increased in men who were single (1.83; 95% confidence interval [CI]: 0.94–3.53; P=0.07), with low socioeconomic status (2.96; 95% CI: 1.14–7.66; P=0.002 for trend), and with a low pulmonary forced vital capacity (FVC) (3.26 for lowest vs. top quartile; 95% CI: 1.67–6.74; P=0.001 for trend). Independent risk factors for death due to external causes were being single, with low blood pressure, and low FVC.

Conclusions: Independent risk factors for suicidal death and death due to external causes were being single, with low blood pressure, and low FVC. Additional risk factor for suicide was low socioeconomic status. Low respiratory function may be markers of impaired fetal and postnatal development, or low respiratory function may lead to impulsivity and emotional dysregulation.

A NEW TREATMENT FOR BIPOLAR DISORDER AND SUBSTANCE DEPENDENCE: ONE-YEAR FOLLOW-UP

INSTITUTIONS
1. McLean Hospital, Alcohol and Drug Abuse Treatment Program, Belmont, United States
2. Harvard Medical School, United States

AUTHORS
1. Margaret L Griffin, Dr., PhD, mgriffin@mclean.harvard.edu
2. William B Jaffee, Dr., PhD, wjaffee@mclean.harvard.edu
3. Fiona S Graff
4. Rachel E Bender
5. Christina Meade, Dr., PhD, cmeade@mclean.harvard.edu
6. Roger D Weiss, Dr., MD, rweiss@mclean.harvard.edu

Aims Despite: the high prevalence of co-occurring bipolar disorder and substance use disorder (SUD), treatment of patients with both disorders is understudied. We developed a cognitive-behavioral treatment (CBT) focused on both disorders, entitled Integrated Group Therapy (IGT); in a previous trial, IGT was more efficacious than standard Group Drug Counseling (GDC) in reducing substance use. The current randomized controlled trial of IGT vs. GDC used substance abuse counselors with no previous CBT training and reduced treatment from 20 to 12 sessions to increase feasibility.

Methods: Patients (N=61) were treated for 3 months, then followed for another year to assess “good clinical outcomes,” i.e., good outcomes for both disorders, which we defined as a combination of abstinence and no mood symptoms. We hypothesized that IGT patients would be more likely to have good clinical outcomes than GDC patients at the end of treatment and that they would continue to have better outcomes one year post-treatment.

Results: Although patients in both treatment conditions reduced their substance use and experienced mood improvement during treatment, IGT patients were twice as likely as GDC patients to have good clinical outcomes in the final month of treatment (45.2% vs. 20.0%; \( \chi^2(1)=4.38, p<.04 \)), as well as one year post-treatment (42.3% vs. 15.4%; \( \chi^2(1)=4.59, p<.04 \)).

Conclusion: These findings extend earlier results by demonstrating that IGT is more effective than GDC in treating both SUD and mood, and that treatment gains are maintained at one year post-treatment.

THE DURATION OF UNTREATED PSYCHOSIS AND ITS CORRELATES IN PATIENTS OF FIRST-EPISODE SCHIZOPHRENIA

INSTITUTIONS
1. Postgraduate Institute of Medical Education & Research, Department of Psychiatry, Chandigarh UT 160012, India

AUTHORS
1. Parveen Rani Gupta, Dr., MD, param_kulhara@yahoo.co.in
2. Subho Chakrabarti, Dr., MD, param_kulhara@yahoo.co.in
3. Parmanand Kulhara, Prof., MD, param_kulhara@yahoo.co.in

Aims/Objectives: A longer duration of untreated psychosis (DUP) has been shown to predict poor functioning and outcome in schizophrenia. However, results have been inconsistent and there is paucity of research from developing countries. This study sought to determine the duration of untreated psychosis, its correlates, and its impact on outcome in patients of first-episode schizophrenia attending the psychiatric unit of a teaching hospital in north–India.

Methods: Structured assessments of diagnosis, onset of psychotic symptoms, mental state, functioning, quality of life and outcome were carried out in a consecutive sample of 30 patients with DSM-IV diagnoses of schizophrenia in their first episodes. A follow-up assessment was carried out after 6 months for the 22 patients available to determine outcome on the above parameters.

Results: Mean DUP was 47 weeks, the median value 36 weeks, with a range of 6–180 weeks. Mean and median values as well as the range of DUP of the follow-up sample were essentially similar to the initial sample. Very few clinical, demographic or psychosocial parameters demonstrated significant associations with DUP. There was no significant association between the period of untreated psychosis and several different aspects of outcome at the end of 6–months.

Conclusion: The lack of positive association between a longer DUP and outcome could be due to several reasons such as methodology;

FACTORS AFFECTING PLASMA CGRP LEVELS IN THE TTH AND MIGRAINE SUBJECTS

INSTITUTIONS
1. University College of Medical Sciences and GTB Hospital, Psychiatry, Delhi, India
2. University College of Medical Sciences and GTB Hospital, Biochemistry, Delhi, India

AUTHORS
1. Ravi Gupta1, Dr, MD, guptaravi_2003@yahoo.co.in
2. Tanzeel Ahmed2, Mr
3. Manjeet S Bhatia1, Dr, MD, manbhatia1@rediffmail.com
4. B D Banerjee2, Dr, Ph D

Background: Calcitonin gene related peptide (CGRP) is an inflammatory marker specific for the activation of trigemino-vascular system, involved in migraine and tension type headache. Very few studies have examined plasma CGRP levels during spontaneous headaches.

Objectives: To find association between the plasma alpha-CGRP levels outside acute spontaneous attacks of migraine and tension type headache and clinical factors.

Method: Fifty subjects of each of the following- migraine, TTH were included in this study after obtaining written informed consent. Blood was drawn from cubital venous blood and plasma was separated. Samples were stored at −70°C for further use. During the blood sampling, severity and duration of headache was also noted. Levels of alpha-CGRP were assessed with the help of enzyme linked immunoassay method (Peninsula Laboratories, LLC).

Results: Levels of CGRP were not different among three groups outside the acute episode of headache. Gender did not have any effect on the CGRP concentration. Presence of aura, phonophobia, photophobia and allodynia, did not affect the CGRP levels. Similarly, CGRP levels were not different among subjects with and without different cranial autonomic symptoms. Only the severity of pain during sample drawing influenced CGRP levels and these were highest in subjects with severe pain. These results were similar for migraine and TTH subjects both.

Conclusion: Plasma CGRP concentration is associated with the severity of episode only. Hence, CGRP antagonists that are under development may help to reduce the severity of pain in migraine and TTH.

PATIENTS’ EXPECTATIONS IN THE MENTAL HEALTH HOSPITAL SETTING

INSTITUTIONS
1. Mazra Mental Health Center, Israel

AUTHORS
1. Yafa Haron1, Dr, PhD, yafa.haron@naharia.health.gov.il
2. Dror Tiran1, Mr, RN, MA
3. Nahe Dawood1, Mr, MA RN
4. Yron Nahmias1, Dr, MA, RN
5. Hamoodi Heiri1, Mr, RN
6. Rahel Yechiel1, Mrs, MA, RN

Aims: The aim of the present study is to learn more about patients’ views and expectations and the characteristics expected from the health care providers in the mental health hospital.

Method: The survey was carried out in nine departments in Mazra Hospital in 2007. The sample was random and response rate was approximately 90% (65 patients agreed to interview). The questionnaire included two parts. Part one asked questions about the characteristics of the ideal physicians and nurses. Part two asked questions dealing with their emotional status and sources of support.

Results: Patients (56%) prefer physicians who focus on diagnosis and treatment procedures rather than on emotional support. Patients who report more frustration or anger prefer physicians who give them a chance to contribute to the decision making process during their treatment. Approximately 75% of patients expect to be involved actively in this process. Differences were found according to anxiety level: patients reporting anxiety or threatened feelings expected more emotional support from nurses and continuing contact, even beyond discharge in outpatients clinics, than patients with less anxiety. A significant correlation was found between emotional status and patients’ preferences. Patients feeling anxious or threatened preferred diagnostically oriented physician; however, they will expected to obtain emotional support from the hospital nurses.

Conclusions: There was a significant variance in patient expectations according to the hospital setting and the emotional status of the patients. Most patients preferred to be involved in the decision making process during their treatment or hospitalization.
NRR-06-01  
**THE MENTAL HEALTH AND BEHAVIOUR OF CHILDREN WHO WERE A CONSEQUENCE OF AN UNPLANNED AND/OR UNWANTED PREGNANCY AT THE TIME OF CONCEPTION: A 21 YEAR FOLLOW−UP STUDY**

**INSTITUTIONS**  
1. University of Queensland, School of Population Health, Herston, Brisbane, Australia  
2. Mater Hospital, South Brisbane, Australia  
3. University of Queensland, School of Social Science, St Lucia, Australia

**AUTHORS**  
1. M.R. Hayatbakhsh  
2. J.M. Najman  
3. W. Bor  
4. M. O’Callaghan  
5. G.M. Williams  
6. G. Shuttlewood

**Aims/Objectives:** Despite the availability of effective birth control, and sometimes widely accessible pregnancy termination services, many children are born to mothers who did not want to have a child at the time the child was conceived. While a great deal of concern has been expressed about the health and well−being of such children, little is known about their long term developmental outcomes.

**Methods:** Data are taken from a large population based pre−birth cohort study. Some 7223 children were recruited to the study over the period 1981−3. Details of the wantedness of the pregnancy are taken from the first obstetrical visit. The children were followed−up some 21 years later using a computerised version of Composite International Diagnostic Interview (CIDI−Auto). The outcomes of interest are DSM−IV anxiety, depression and substance use disorders.

**Results:** Unwanted children are not a cross section of the population but are disproportionately conceived by young, single mothers living in economically disadvantaged circumstances. While unadjusted comparisons suggest that unwanted children may experience a higher rate of some mental health problems, after adjustment there are no mental health differences between wanted and unwanted children.

**Conclusion:** While there is an understandable concern about the mental health of a child who was unwanted at the time of conception, there has been little objective evidence that such children have worse mental health outcomes. This study finds that most mothers ‘change their minds’ about wanting their baby and that there are no mental health differences between wanted and unwanted children once they reach adulthood.

**PRESCRIPTION DRUG COST−SHARING AND ANTIPSYCHOTIC DRUG TREATMENT − UNINTENDED ADVERSE CLINICAL EFFECTS**

**INSTITUTIONS**  
1. KFRI, Center for Health Policy Studies, Oakland, United States

**AUTHORS**  
1. John Hsu, Dr., MD, MBA, MSCE  
2. Mary Price  
3. Vicki Fung, Dr., PhD

**Rationale:** Health plans are increasingly using cost−sharing for patients with psychiatric conditions. There is limited information on the potential clinical ramifications.

**Objectives:** We investigated the impact of a $1,600 annual drug benefit cap in 2001, changing to a $1,000 annual cap in both 2002 and 2003, compared with a concurrent control group with no benefit limits.

**Methodology:** All 4,973 subjects were 65+ years with Medicare insurance and were members of an integrated, prepaid delivery system. We used regression models to examine the association between having a cap and drug consumption, and to assess the association between having a cap and drug adherence. We adjusted for individual characteristics and time.

**Results:** In 2001, 48% of subjects had a $1,600 annual cap, and the others had no benefit limit. In the multivariate model, subjects with a cap consumed 21% less than their expected drug consumption if they had no cap (p−value<0.0001): 14% less in 2001; 25% less in 2002; and 27% less in 2003. Adherence was lower in cap versus non−cap subjects, e.g., OR=0.82 (95%CI:0.74−0.91) for subjects on atypicals. Compared to non−cap subjects, cap subjects had higher out−of−pocket drug costs (144% higher, p−value<0.0001): 93% higher in 2001; 176% higher in 2002; and 189% higher in 2003.

**Conclusions:** In patients with Medicare insurance receiving antipsychotics, drug caps were associated with less drug consumption, lower treatment adherence, and higher out−of−pocket costs.

THE SELF, THE OTHER AND THE OTHERS – HOW TO BE ABLE TO SHARE PSYCHOTIC EXPERIENCES IN THERAPEUTIC GROUP?

INSTITUTIONS
1. Kaposi Mór Teaching Hospital, Department of Psychiatry, Kaposvár, Hungary

AUTHORS
1. Zsuzsanna Jákó1, oposszum@t-online.hu
2. Zoltán Terényi1, terka@t-online.hu
3. Ákos Varga1, euroaki@yahoo.com
4. Katalin Szöke1, PhD, linuka@freemail.hu
5. Gyöngyi Pál1
6. Katalin Sz Csaligné1

Objectives: A main point of psychosis psychotherapy is the correction of confused reality testing and desintegrated borders of self through the participation/sharing of the inner world of the patient. Is the manifestation of a given psychotic experience a matter of a connection between two individuals within the group, which only serves as a facilitating background for this diadic attunement? Or, rather, on the transpersonal level of the group as a whole can the psychosis be unfolded, and all the members take part of it?

Methods: We examined the patterns of the interactions and the symbolic contents working with patients with acute psychosis in a group-psychotherapy led by a coterapeutic team, at an active psychiatric ward. We used the notes of the group sessions, our individual, personal reflections and the topics of the team conversations following the sessions held.

Results: The members of the team were several times part of diadic interactions, which implicated the empathic understanding of psychotic contents, both on the level of emotional utterance, and on the level of understanding the possible meaning. The major part of these interactions had an interpretation also at the level of the group dynamics, looking at the group as a whole.

Conclusion: Diadic connection and connection with the group as a whole can be well defined theoretically. Differentiating the levels of connections concerning the psychotic experiences and the conscious participation in these complex relational patterns can help the unfolding of these experiences, and the validation of the healing factors of the group therapy.

Aims: The aim of the paper is to assess the intensification of obsessive–compulsive and depressive symptoms and anxiety in anorexia nervosa (AN) patients during a 6–month observation. For each female patient (aged 12.5–24) the following were calculated: BMI, obsessive–compulsive symptoms with Children's Yale–Brown Obsessive–Compulsive Scale (CY–BOCS), depressive symptoms with Hamilton Depression Rating Scale (HAM–D), and anxiety as trait and state with Spielberger STAI C.D. Assessments were made upon admission and after 2, 3 and 6 months of treatment. Control group consisted of 20 healthy girls.

Results: In the AN group, BMI is statistically significantly lower than in the control group. Comparison of obsessive– compulsive symptoms intensification showed no statistically significant differences between the two studied groups. Analysis of depressive symptoms in AN patients and the control group showed a statistically significant increase in AN patients upon admission and after 6 months of treatment. Comparing the levels of anxiety as a state showed a statistically significant intensification in AN patients upon admission and after two months of treatment, while the analysis of anxiety as a trait showed a statistically significant intensification in AN patients only upon admission.

Conclusions: It is of crucial importance to be very careful when stating a double diagnosis, i.e. AN plus obsessive–compulsive disorders, or AN and depression or AN and anxiety disorders. The presence of obsessive–compulsive and depressive symptoms and anxiety in both anorexia nervosa patients as well as the control group suggests characteristic mental manifestations of the adolescence as such, rather than symptoms co–occurring in AN.

PREDICTORS OF RAPID RE–INCARCERATION IN YOUNG DETAINEEs WITH PSYCHIATRIC DIFFICULTIES REFERRED FOR COMMUNITY MENTAL HEALTH FOLLOW–UP

INSTITUTIONS
1. Justice Health, Adolescent Forensic Psychiatry, Sydney, New South Wales, Australia

AUTHORS
1. John Kasinathan¹, Dr, MBBS, FRANZCP, johnkas@med.usyd.edu.au
2. Claire Gaskin¹, Dr, MBBS, FRANZCP, claire.gaskin@justicehealth.nsw.gov.au

Background: Little was known about the characteristics and outcomes of juvenile detainees treated for psychiatric illnesses in NSW juvenile custody and subsequently referred to community mental health services (CMHS) upon release from custody. Anecdotally, such detainees seemed to quickly re–enter custody, though actual numbers were not known.

Aims: To identify demographic and mental health trends for this population, rates of subsequent incarceration and predictors of a rapid return to custody.

Methods: A retrospective audit of the health files of 51 young detainees consecutively referred to CMHS upon release from custody between 1 January 2005 and 31 December 2007. Earliest dates of return to custody were determined.

Results: Ages ranged from 16 to 20. 47% were Indigenous. 43% were from regional communities. Substance misuse was high: alcohol 82%, cannabis 100% and amphetamines 59%. 39% were suicidal and 18% homicidal in custody. 57% satisfied diagnostic criteria for schizophrenia. Further relevant findings will be presented. 76% returned to custody in the follow–up period, 31% of which was to adult jail. A Kaplan–Meier survival analysis found the median time to re–incarceration was just below 4 months. Linear regression analyses found that diagnoses of schizophrenia and bipolar disorder, a family history of mental illness and temporary accommodation on release predicted a rapid return to custody (p<.01). The length of time treated prior to release predicted a longer stay in the community (p=.02).

Conclusions: These valuable findings involving this vulnerable population should assist service planning, delivery and hopefully better integration into community care.

MALE INFERTILITY AND DEPRESSION DISORDER IN GREECE

INSTITUTIONS
1. TEI of Patras, Department of Physiotherapy, Aigion, Greece

AUTHORS
1. Maria J Katsardi¹, Mrs, mkatsard@freemail.gr
2. Constantinos M Koutsojannis¹, Mr., ckoutsog@teipat.gr

Aims/Objectives: Infertility has come to be defined almost exclusively as a medical condition. The psychological and social needs are addressed only for their implication with assisted reproduction approaches.

Methods: 26 male individuals who faced infertility of mean age of 37 years, married, well educated, with no children at all, participated in this study, in the three major Greek cities. Participants answered a questionnaire and a structured interview respectively as well as a standardized questionnaire calculating Major Depressive Disorder risk (MDD). Data were analyzed through SPSS 15.0 statistical and NVIVO 7.0 software packages.

Results: Severe psychosocial problems impact the everyday life of Greek males mainly the elders (74%) that include feeling of stress (47%), anger (68%) and guilt for the infertility (81%). MDD study resulted in an elevated risk factor (p< 0.05) that was accompanied with an emotional disorder in comparison with 30 male parents of the same age used as “normal” group in our study. Most of them ask for health care psychiatric assistance, as well as social intervention among other systems as friends, and colleagues (57%).

Conclusion: Elevated MDD risk introduces the need for further studying of men and women as individuals, and as part of couples and systems considering that infertility impacts also working environments.

3. Pavla Stopkova\(^3\), Dr., MD, PhD
4. Martha Shumway\(^1\), Dr, PhD, martha.shumway@ucsf.edu

Aims/Objectives: Societal context affects disease prevalence and health services. This project compared patient and neighborhood characteristics of involuntary admissions to psychiatric emergency services (PES) in two cities, San Francisco (SF) and Prague, to illustrate differences in safety net services for persons with severe mental illness.

Methods: Demographic, clinical and referral source data were extracted for 1262 involuntary admissions of adults to SF General Hospital (PES) from January 1, 2005 through March 30, 2005, and 544 admissions to all of Prague's inpatient psychiatric hospitals from January 1, 2003 to December 31, 2003. Neighborhood data were obtained from U.S. and Czech Republic Censuses and negative binomial regressions used to examine factors affecting PES admissions.

Results: Primary diagnosis for admissions to Prague and SF PES reflected similar proportions of psychoses (48% and 53%), but Prague had more substance abuse disorders (30% vs. 3%) and San Francisco had more depression (33% vs. 5%). Police were involved in 45% of admissions in San Francisco, versus 13% in Prague, and friends/family members were involved more frequently in Prague's admissions (53% vs. 20%). Males accounted for more admissions in San Francisco (65% vs. 50%). Some neighborhood characteristics were associated with admissions in San Francisco, but not in Prague.

Conclusion: Higher rates of police involvement and admissions of males suggest that PES admissions in San Francisco serve more of a public safety function than in Prague. Higher rates of depression and lower rates of family involvement suggest greater social isolation amongst those who use PES in SF.

QUALITY OF LIFE OF A SAMPLE OF SCHIZOPHRENIC PATIENTS

INSTITUTIONS
1. ALAMAL COMPLEX FOR MENTAL HEALTH, PSYCHIATRY, DAMMAM, Saudi Arabia

AUTHORS
1. Mohsen Elsayed Khalil\(^1\), Dr., MD, mohsenelsayedkhalil@hotmail.com

Quality of life is taking account of everything beyond mortality and symptoms levels. Improving the quality of life of persons with chronic mental illness is becoming an important treatment goal. In this study, 55 patients with schizophrenia were interviewed using Lehman’s Quality of Life Interview. A particular focus was whether clinical characteristics, such as medication compliance, medications side effects and social skills, could be changed by interventions. Self-reports of better quality of life were associated with fewer depressive symptoms, fewer medication side effects, and better family interactions. Results indicate that clinical interventions to improve quality of life in this population should include family psychoeducational programs and better detection, evaluation, and treatment of both depressive symptoms and side effects of medication.
The aim of this study was to review the effectiveness of MPH treatment of adult ADHD and to examine the influence of methods on meta-analytic results.

Electronic databases were searched to identify clinical trials comparing MPH with placebo in the treatment of adult ADHD. Studies were summarized with meta-analytic methods. Subgroup analyses were conducted with respect to parallel group vs. cross-over trials and self vs. observer ratings. The relationship between dosage and effect size was explored by weighted regression analysis. The results were tested for publication bias, and several sensitivity analyses were performed. Findings and methods were compared with a previous meta-analysis.

Eighteen studies met the inclusion criteria of which 16 were included in the meta-analysis. The overall effect size (d=0.42) was significantly different from zero, but was only half the size expected on the basis of a previous meta-analysis. No significant differences could be observed in the subgroup analyses. The regression analysis showed no significant influence of mean daily dose on effect size. These results contradict findings of a previous meta-analysis and challenge guideline recommendations.

Introduction: Like most of developed countries, mental health of immigrants’ children is becoming a big issue in Japan, though few studies have been done so far in this field.

Objective: To assess the mental health state of Japanese-Brazilian children in Japan, we conducted the research both in Japan and Brazil by using Strength and Difficulties Questionnaire (SDQ).

Method: The subjects in Japan were students, aged from 4 to 16, studying at 5 Brazilian schools in Gunma and Tochigi. The subjects in Brazil were Japanese-Brazilian students, aged from 4 to 16, studying at one private school in Sao Paulo. SDQ was applied for guardians, teachers and students themselves over 11 years old. The implementation of this research was from August to October in 2007 both in Japan and Brazil.

Result: 228 cases in Japan and 122 cases in Brazil for pupils aged 5 to 10, and 73 cases in Japan and 59 cases in Brazil for students aged 11 to 16 were available for the analysis. Combining the result of SDQ obtained from guardians, teachers and students, significant difference (p<0.05) was seen in the diagnostic hypotheses of conduct disorder for the children aged 5 to 10 between Japan and Brazil. (The pupils in Japan showed the higher rate than those in Brazil.)

Conclusion: Japanese-Brazilian children in Japan are supposed to have more difficulties in their mental health than those in Brazil.

**THE RELATIONSHIP BETWEEN DEPRESSION AND INTERNET USE OF YOUNG PEOPLE IN GREECE**

**INSTITUTIONS**
1. TEI of Patras, Physiotherapy, Aigion, Greece

**AUTHORS**
1. Constantinos Koutsojannis¹, Mr., PhD, ckoutsog@teipat.gr
2. Maria Katsardi², Mrs, mkatsard@freemail.gr

**Aims/Objectives:** Although extended research has shown that psychiatric illnesses such as depression are often associated with alcoholism, drug addiction, eating disorders, pathological gambling and recently internet addiction, little research has been conducted to examine if similar underlying psychiatric illnesses may contribute to Internet use.

**Methods:** 98 young Greek individuals (51 male and 47 females) that were selected from active Internet users who responded to electronic support groups of mean age of 23.1 years, participated in this study. Participants answered a standardized questionnaire detecting Major depressive disorder (MDD) and the results were correlated with hours/day of Internet use and their demographic data.

**Results:** Mild psychological problems impact the everyday young Greek Internet users that include feeling of emotional difficulty (32%) and depression (7%). MDD study resulted in an elevated depression factor accompanied with emotional disorder and proved high correlation with time of internet use (p<0.01), even taking account gender, age and education correlations after t and x²-square tests as well as Factor Analysis with SPSS 15.0

**Conclusion:** Elevated MDD introduces need for comprehensive study of young individuals, and as part of systems as schools and families considering that increased levels of social isolation subsequent to excessive time spent in front of a computer may result in increased depression rather than Internet use only.

**MEDIEVAL MYSTIC CONSCIOUSNESS: DISSOCIATION IN THE VISIONS OF HADEWIJCH**

**INSTITUTIONS**
1. University of Pretoria, Psychiatry, Pretoria, South Africa

**AUTHORS**
1. Christina Kruger¹, Prof., MD, christa.kruger@up.ac.za

**Aims:** This study examines the consciousness of a mystic from medieval civilisation. A contemporary contextual psychiatric model of dissociation is applied to the Flemish writer Hadewijch of Brabant, whose work (31 letters, 61 poems, 14 visions and some songs, written in middle Dutch, c. 1221−1240) represents an integration of Latin theology with courtly troubadour love poetry – hence a love mysticism.

**Methods:** As a document−based, instrumental case study, Hadewijch's life and work as a leader in the beguine spiritual movement are examined for contextual sources of ambivalence and conflict. Her visions are analysed thematically for altered states of consciousness or potential dissociation. Phenomenological research methods are used to construct a cohesive interpretation. Furthermore, her dissociative experiences are interpreted in the light of the contextual model of dissociation, according to which dissociation is an information–processing tool that aids the development of one's sense of self–in–society, in the face of conflicting messages from one's intrapsychic, interpersonal, socio–cultural and spiritual contexts.

**Results and conclusions:** Hadewijch moved freely between alternate states of consciousness. Moreover, she had sufficient conscious access to material from her trance states, to integrate this in her teaching of fellow beguines. Her visions and dissociative experiences reveal her growth towards, and her teaching on, an integrated God–experience, despite pernicious socio–cultural–spiritual dichotomies. Her theological synthesis seems to reflect her inner psychological integration of consciousness and the unconscious. The contextual model of dissociation proves to be a useful psychiatric hermeneutical tool for interpreting a person's consciousness in a different historical and cultural epoch.
Clinical data and recent experimental data in rodents with targeted inactivation of the gene of dipeptidyl peptidase IV (DPPIV/Cd26, EC 3.4.14.5) testify for the implication of proline specific serine type peptidase, in the pathophysiology of depression and anxiety. This peptidase is involved in several physiological functions by cleavage of dipeptides from regulatory peptides including behaviorally active neuropeptides, e.g. neuropeptide Y and substance P shown to modulate anxiety− and depression−related behaviors as well as stress response in various animal models. The aim of present work was to study the effects of DPPIV activity modulation in early postnatal period from day 5 to day 18 in rat pups (males and females) by administration of irreversible synthetic inhibitor of DPPIV methionyl−2(s)−cyano−pyrrolidine (1 mg/kg, i.p). Anxiety− and depression−related behaviors were evaluated monthly in 1−4− and 7−months−old animals. Increased anxiety in elevated plus−maze was revealed in 1−2−months−old males and 1−3−months−old females treated with inhibitor of DPPIV. Besides, 1−month−old adolescent males exhibited prolonged latency of leaving the centre of the open field comparing with saline−treated control. Adult males (2− and 7 months−old) also showed increased anxiety in a battery of tests for evaluating anxiety−phobic states. Depression−related immobility behavior and rhythmological index of depression were higher in adult rats of both genders as compared with control in forced swimming test. Adolescent and adult rats in experimental groups presented anhedonia in sucrose preference test. Adult males also exhibited social deficit. Data prove the development of anxiety−depression state in rats postnatally exposed to inhibitor of DPPIV.

Aims/objectives: There are very few randomised−controlled trials of structured family interventions for schizophrenia from developing countries. This study attempted to evaluate the impact of a structured family−based intervention for schizophrenia on several patient and family−related parameters and compare the effects of family intervention with “routine” outpatient treatment on these parameters.

Methods: Seventy six patients with DSM−IV diagnoses of schizophrenia and their caregivers were randomly allocated to receive either a structured family intervention consisting of monthly sessions for 9 months (n = 38) or „routine” outpatient care consisting of medication management and supportive counselling for the same duration (n = 38). Structured assessments of severity of illness, levels of dysfuntion, coping, burden, perceived support and satisfaction with treatment among caregivers were carried out at baseline and upon completion, and compared between the two intervention groups.

Results: Comparisons were carried out for an „intent−to−treat” sample as well as those who completed the entire trial. Although both family intervention and routine outpatient care were efficacious, structured family intervention was significantly better than routine care on a number of clinical and psychosocial indices including psychopathology, disability, social support and satisfaction with treatment. The family intervention package used was simple, feasible and ‘value for money.’

Conclusions: The results suggest that structured family intervention is a viable option for treatment of schizophrenia even in non−Western settings like India. However, many more trials will be required to resolve issues regarding the format of structured family interventions, implementation of treatment, training requirements, and cost−effectiveness.

2. Zakusov State Institute of Pharmacology, Russian Academy of Medical Sciences, Moscow, Russian Federation

**AUTHORS**
1. Ekaterina Yu. Kushnareva, Mrs., alekapierpo@mail.ru
2. Nataliya A. Krupina, Dr.
3. Nadezhda N. Khlebnikova, Dr.
4. Nikolai N. Zolotov, Dr., Doctor of Biology

Clinical data give evidence that psychiatric disorders, such as depression and anxiety are associated with significant decrease in serum and plasma activity of prolyl endopeptidase (PEP, EC 3.4.21.26) and dipeptidyl peptidase IV (DPPIV, EC 3.4.14.5). However there is lack evidence to the implication of these proteases in the genesis of anxiety and depression. Recently we have shown that rats postnatally exposed to inhibitor of DPPIV exhibit the increase in anxiety– and depression–related behaviors. The aim of present work was to study the activity of DPPIV and PEP in brain structures of rats with DPPIV inhibitor–induced anxiety–depression state. Irreversible synthetic inhibitor of DPPIV (methionyl–2(S)–cyano–pyrrolidine) was injected in rat pups throughout 5–18 postnatal days (1 mg/kg, i.p.). In experimental groups the increased anxiety in 1–month–old males was associated with the increase in DPPIV and PEP activities in frontal cortex (FC), whereas in females – with the increase in DPPIV activity in nucleus accumbens (NAcc), striatum (STR) and in DPPIV and PEP activity in hippocampus (Hip). In hypothalamus DPPIV activity was increased in both males and females. Depression–like behavior in 3–month–old male rats was associated with increased activity of both peptidases in NAcc comparing with control and experimental females. In 7–month–old males anxiety and higher pain sensitivity were accompanied by increasing PEP activity in FC, and DPPIV activity in Hip. Data confirm the hypothesis that modulation of DPPIV activity in early ontogenesis may cause persistent disturbances in behavior such as anxiety–depression state together with alterations in DPPIV and PEP activity in various brain structures.

2. Wendyl J D’Souza, Dr, MBChB
3. Michael R Salzberg, Dr, MD

**Aims:** To identify contributions of established depression risk factors (early caregiving environment, neuroticism, stressful life events, social connection, and the serotonin transporter polymorphism) to the risk of developing depression in patients with epilepsy.

**Method:** The Tasmanian Epilepsy Register (TER) was recruited from the Australian national prescription database. Following enrolment, participants aged≥16 years without intellectual disability were mailed a written questionnaire and saliva (DNA) collection tube. The self–completed questionnaire consisted of the following components: Centre for Epidemiologic Studies Depression Scale (CES–D), SF12, Measure of Parenting Style, Global Perception of Early Life Stress, List of Threatening Experiences, past and family psychiatric history questions, IPIP–Neuroticism and socioeconomic status. Logistic regression analysis was performed to assess factors predictive for depression.

**Results:** Of 1050 enrolled on the TER aged≥16, 820 were eligible (230 excluded: 17 died, 97 intellectual disability, 116 unable to be traced). Initial enrolment rate was 76% (624 consented, 197 refused). DNA and questionnaires were completed by 514 participants and questionnaires only by 36 (response rate 67%, 550/820). Depression (CES–D >15) was present in 46% of participants, with 27% reporting severe depression (CES–D ≥22). Serotonin polymorphism genotype was not associated with depression. Predictive factors of depression were stressful life events and social supports. Potential serotonin transporter polymorphism x environment interactions are presented.

**Conclusion:** Depression is common in community–treated patients with epilepsy. Depression risk factors include stressful life–events and social supports and resemble those seen in depression in the general population. Gene x environment interactions require further investigation in patients with epilepsy.

8. Benjamin D Greenberg¹, Dr, MD

Background: Treatment refractoriness in Obsessive Compulsive Disorder (OCD) can be observed in up to 40% of patients. For these refractory cases, radiosurgery is a treatment option. An improved, radiosurgical technique was recently developed (Gamma ventral capsulotomy – GVC). Preliminary findings of a double-blind, randomized controlled trial (RCT) with this procedure are already available.

Objectives: To conduct the first double-blind, randomized controlled trial of Gamma ventral capsulotomy for refractory OCD patients.

Methods: Fifteen refractory OCD patients were selected. A pilot study was conducted with the first five subjects. The remaining 10 patients were randomly allocated to receive active (5 subjects) or a false radiosurgery (5 subjects), in a double-blind RCT. All patients were followed-up for at least one year, with multiple assessments which included psychopathological, global status, neuropsychological and personality scales, and magnetic resonance imaging scans with voxel-based morphometry (VBM).

Results: Twelve months or more after surgery, three out of five patients (60%) from the pilot study and three out of five (60%) from the active surgery group became responders. None of the five patients allocated to false radiosurgery responded, up to the 12th postoperative month. Few side effects were seldom observed, like hypomanic/manic episodes, delirium, episodic headaches, dizziness, nausea. The pilot patients showed postoperative improvements on simple visual attention (p=0.04), logical memory (p=0.04), and verbal/full IQs (p=0.04).

Conclusions: Preliminary findings suggest that GVC for OCD is efficacious when compared to a placebo surgery and is relatively safe.

Background: Previous research has demonstrated neuropsychological impairments in bipolar disorder. Only few studies compared cognitive functions across different clinical states of bipolar disorder.

Objectives: To investigate and verify the patterns of cognitive dysfunction in the different phases of bipolar disorder and to find out the relationship between clinical features and cognitive impairments.

Methods: Four groups; 28 manic, 21 depressed, 25 euthymic patients and 20 healthy control were administered a brief battery of neuropsychological tests for assessment of attention, executive function, visual and verbal memory.

Results: All bipolar groups showed poorer neuropsychological performance in all tests compared to the control group. The 3 bipolar groups showed some distinct pattern in types and severity of cognitive impairments. Patients with longer duration of illness, early onset, greater number of episodes and with history of psychotic features were found to show poorer performance.

Conclusion: Cognitive impairments are present across all phases of bipolar disorder. Although they seem to be genuine in nature, they are influenced by chronicity of illness, frequency of episodes and psychiatric symptoms.

6. Hans-Helmut Koenig, Prof. Dr., MD
7. Matthias C. Angermeyer⁵, Prof. Dr., MD
8. Stefi G. Riedel-Heller⁵, Prof. Dr., MD

Aims/Objectives: Information on the time until institutionalization and its predictors in demented subjects has so far been based on studies with selected samples or prevalent dementia cases. Thus, the aim of the study is to analyze the time until institutionalization and associated patient-related predictors in incident dementia cases.

Methods: Data were derived from the Leipzig Longitudinal Study of the Aged (LEILA75+), a population-based study of individuals aged 75 years and older. Kaplan-Meier survival analysis was used to determine the time until institutionalization. Predictors of time were analyzed using Cox proportional hazards models.

Results: 109 subjects with incident dementia who resided in a private home setting at the time of the dementia diagnosis were identified. 52 (47.7%) of these subjects had become residents of a nursing home by the end of the study. The median time until institutionalization was 1,005 days (95% CI = 808–1,202) or 2.8 years (95% CI = 2.3–3.3). Marital status of being divorced/widowed was found to be an important predictor of a shorter time (HR = 4.50).

Conclusion: Findings on time until institutionalization in incident dementia cases can contribute to service planning. Knowledge about predictors of time until institutionalization may help in designing interventions to delay institutionalization.

5. Matthias C. Angermeyer⁵, Prof. Dr., MD
6. Hans-Helmut Koenig, Prof. Dr., MD
7. Stefi G. Riedel-Heller⁵, Prof. Dr., MD

Aims/Objectives: Only few studies, exclusively conducted in the USA, have examined the impact of depression on direct costs in the elderly (60+). This study aims to determine the effect of depression on direct costs of the advanced elderly in Germany from a societal perspective and compared direct costs of GP-recognised and -unrecognised depressed elderly.

Methods: 451 primary care patients aged 75+ were investigated face-to-face regarding depressive symptoms (Geriatric Depression Scale), chronic medical illness (Chronic Disease Score) and resource utilisation and costs (cost diary). Resource utilisation was monetarily valued using 2004/2005 prices.

Results: Mean annual direct costs of the depressed (€ 5,241) exceeded mean costs of non-depressed individuals (€ 3,648) by one third (p<.01). Significant differences were found for pharmaceutical costs, costs for medical supply and dentures, and for home care. Only few costs were caused by depression treatment. Depression has a significant impact on direct costs after controlling for age, gender, education, chronic medical illness and cognitive functions. A one-point increase in the GDS-Score was associated with a € 336 increase in the annual direct costs. We found direct costs of EUR 5,582 for unrecognised and EUR 4,722 for recognised with no significant difference.

Conclusion: Depressive symptoms in old age are associated with a significant increase of direct costs. Therefore, health policy should promote the development and use of cost-effective treatment strategies.
Cancer disease influences all aspects of human functioning (biological, psychological, psychosocial and spiritual level). The aim of this work was to find an answer to the question whether there is an interdependence between assessments of all these levels. With appropriate tools 590 persons (ill and healthy) were examined and asked to take into consideration the level of fear, depression, aggression, quality of life, the purpose and the meaning of life. Using statistical procedures three clusters were established. The first cluster consists of healthy people. Second and third consist of sick persons — although they have estimated their level of physical fitness and general quality of life similarly, there were some essential differences in ways of reacting connected with disease (second cluster was worst and third better adjusted).

The majority of people suffering from cancer is well adapted to early stages of illness. While the cancer advances the percentage of those worse adjusted rise. However, even in the terminal stage some of the patients (about 1/3) still belongs to the cluster of quite well adjusted. Established sense of life, system of values, and personal religion help to adapt to difficult situations. Results show that there is no connection between assessments on biological and other levels. We can distinguish group of patients, that are similar in judging their physical condition, and still vary in their judgements of their emotional state or sense of life.

**Aims/objectives:** Recent findings would suggest a possible involvement of the serotonin system in the pathophysiology of pathological gambling (PG) [1,2]. The aim of this study was to investigate the serotonin transporter (SERT), by means of the $[^{3}H]$--paroxetine ($[^{3}H]$--par) binding to platelet membranes, in patients affected by PG, as compared with a similar group of healthy control subjects.

**Methods:** Seventeen drug--free PG patients were recruited in the study. The diagnosis was assessed according to DSM--IV criteria and the PG severity was measured by means of the South Oaks Gambling Screen. The platelet $[^{3}H]$--Par binding was carried out according to a standardized method. The binding parameters, the maximum binding capacity ($B_{\text{max}}$) and the dissociation constant ($K_{d}$), were obtained by means of the Scatchard analysis.

**Results:** The $B_{\text{max}}$ values of PG patients were significantly lower than that of healthy subjects, while the $K_{d}$ values were not different in the two groups. No significant effect of age, sex or psychiatric comorbidity on $B_{\text{max}}$ or $K_{d}$ was observed.

**Conclusions:** the decreased density of SERT proteins in PG patients would suggest involvement of presynaptic serotonergic neurons in this condition whose alterations may provoke, reflect or predispose towards to onset of impulsive behaviours, such as that typical of PG.

PARAPHRRENIA IN HOMICIDAL AND NON–HOMICIDAL SCHIZOPHRENIA

INSTITUTIONS
1. S BALNP St. Naum, 4th KFPFP, Psychiatry, Sofia, Bulgaria

AUTHORS
1. Petar M. Marinov1, Mr., MD, PhD, petmarinov@abv.bg

Paraphrenia is described as delusional state with predominantly absurd and fantastic delusional ideas. This category is not included as a distinct nosological entity in contemporary classifications. Some psychopathological instruments are used to assess paraphrenia and delusional disorders. Special attention on the topic is focused in PANSS–GP, where the item „unusual thought content” was placed.

Methods: We investigated 40 patients with homicidal schizophrenia and compared them to 43 patients with non–homicidal schizophrenia by means of PANSS.

Results: Significantly higher levels of „unusual thought content” was found in the group of homicidal schizophrenia (4.16 in homicidal compared to 1.95 in non–homicidal group, p<0.001). Gender differences in both groups were non significant.

Discussion: These results suggest that patients with homicidal course of the illness have same differences in psychopathology, which can reflect not only the level of symptoms, but also the form of the disease.

3. Abdel Nasser Omar1, Dr., MD
4. Yasser Abdel Razek Mohamed Hassan Elsayed1, Dr., MD, yarazek68@gmail.com

Suicide, the most serious complication in patients with mood disorders, is the cause of death in 15 to 25% of untreated patients with mood disorders.

Aim Of the study: To assess suicidal risk in patients with mood disorders through its correlation to the personality profile of those patients.

Subjects & Methods: The cases were selected from inpatients admitted in the Institute of Psychiatry. The sample is a selective one including the first 50 patients admitted at the Institute and fulfilling the criteria of bipolar or unipolar mood disorders according to DSM–IV. Patients were diagnosed by SCID–I. personality was assessed TCI–R, Suicidal ideation was assessed using Beck scale for suicide ideation.

Results: 64% of patients did not have a previous history of suicide attempts. Correlation of Cloninger temperament and character to scores of patients in Beck Scale for suicide ideation revealed Direct relationship with total scales of personality dimension reaching point of statistical significance with Harm Avoidance (HA1) (p=0.017) and higher mean scores of RD2 (Openness to warm communication vs. aloofness) among patients with previous suicide attempts with significant statistical difference. Also higher mean scores of HA1 (Anticipatory worry and pessimism vs. uninhibited optimism) among patients with previous suicide attempts with significant statistical difference.

Conclusion: Suicidal risk in patients with mood disorders is correlated to their personality profiles. Personality assessment in patients with mood disorders is essential to predict risk of suicide in those patients.

PROTECTIVE FACTORS AND RISK FACTORS FOR HIV INFECTION OF MEXICAN–AMERICAN GAY MEN

INSTITUTIONS
1. University of Texas at Arlington, School of Nursing, Arlington, United States
2. University of Texas Health Science Center at San Antonio, Family Nursing Care/ OB/GYN, San Antonio, United States

AUTHORS
1. Mark Meyer, Mr., MSN, meyerm2@uthscsa.edu
2. Jane Dimmitt Champion, Dr., PhD, dimmitt@uthscsa.edu

Objective: Latinos, particularly Mexican–American are disproportionately affected by the HIV epidemic. The purpose of this study was to explore the lived experience of Mexican–American gay men regarding what it was like to grow up as a Mexican–American gay male. The study focused on protective and risk factors for HIV infection, in the hope that information drawn from the research may later be used to develop culturally sensitive interventions targeted towards Mexican–American gay men.

Methods: Mexican–American gay men 30 to 60 years of age who are living in Dallas, Texas. A phenomenological approach was utilized, including semi-structured interviews with open-ended probes. Van Manen's method of interpretive phenomenology and data analysis guided the data analysis.

Results: Identified patterns included: 1) Accepting, 2) Machismo, 3) Loving, 4) Respecting, 5) Dating, 6) Being HIV negative and 6) Being HIV positive. Within each of these patterns, themes were identified: 1) Accepting: (a) accepting one's sexuality and (b) hiding related to shame and oppression, 2) Machismo: (a) protector and (b) hypermasculinity, 3) Loving: (a) being in love and (b) loneliness, 4) Respecting: (a) family, (b) self and (c) life, 5) Dating: (a) using protection and (b) taking risk, 6) Being HIV negative: (a) taking risk, 7) Being HIV positive: (a) living then – taking risk and (b) living now – using protection and (b) living now – taking risk.

Conclusions: Themes identified as protective or risk factors for HIV infection may promote development of effective HIV preventive interventions geared towards Mexican–American gay men.

POLYSOMNOGRAPHIC FINDINGS IN PATIENTS WITH „DYSTHYMIA“: A STUDY IN AN EGYPTIAN SAMPLE

INSTITUTIONS
1. AIN SHAMS UNIVERSITY, INSTITUTE OF PSYCHIATRY, CAIRO, Egypt

AUTHORS
1. Azza Abdel Nasser, Dr., MD, drtareksaad@yahoo.com
2. Yasser Abdel Razek Mohamed Hassan Elsayed, Dr., MD, yarazek68@gmail.com
3. Farouk Lotief, Dr., MD, drtareksaad@yahoo.com

Background and Objective: Characteristic sleep patterns have been described in some psychiatric disorders, but the sensitivity and specificity of such changes have been always a matter of debate. REM sleep changes, especially short REM latency, have been thought as „specific“ to depression. With more extensive studying, similar changes have been reported in other psychiatric and non-psychiatric disorders, but the changes were, more in depression. The difference between dysthymia and major depression is thought by some investigators to be „quantitative“, and by others to be rather „qualitative“. The aim of the present study was to highlight this area, evaluating sleep profile in patients with dysthymia and how far it resembles, or differs from what has been previously described in major depression.

Subjects & Methods: 20 patients fulfilling DSM–IV criteria of dysthymic disorder ( according to SCID–I assessment ) have been recruited from those attending outpatient department of Ain Shams University Psychiatric Institute, together with 10 age and sex matched healthy controls. Both patients and controls were subjected to physical and psychiatric examination, standardized sleep questionnaire for assessment of subjective sleep complaints, as well as all−night polysomnography (repeated, when needed).

Results: Significant findings included: short REM latency, prolonged first REM period, decreased slow wave sleep and decreased sleep efficiency. REM % and REM density were not significantly different.

Conclusion: dysthymic disorder shares some of the polysomnographic features described in major depression, which is in favour of considering it a „subtype“ of mood disorders, rather than being a „separate“ entity.

2. Dorine Neveu2, Dr
3. Edouard Carrier3, Dr, MD
4. Alain Perroud4, Dr, MD

Introduction: Occurrence of anorexia and body mass index (BMI) fluctuations are explained in similar proportions (30% and 70% respectively) by non–shared environmental factors and genes, some being implied in weight and food intake regulation. This case–control study explored a possible different BMI evolution between 2 and 10 years of age between anorexic and healthy volunteers.

Methods: Cases and controls were between 10 and 35 years old, without previous overweight. Anorexia should have been diagnosed according to DSM–IV criteria after age 10, without any previous bulimic phase nor weight related addiction. Controls’ proxies had no eating disorder. Weight, height, diseases and their occurrence date were extracted from each subject’s administrative medical notebook. Social–demographic data were recorded with a self administered questionnaire. Mixed models were used for data analyses.

Results: Social–demographic data from the 107 patients and 75 controls were similar. At age 2, BMI were significantly higher in cases than in controls. This difference remained until age 5 (p<0.0018). Mean adiposity rebound (5.48 years and 5.59 years) were similar between cases and controls. Absolute slope values before and after adiposity rebound were similar in cases whereas they tended to differ in controls (p=0.063).

Conclusion: Between 2 and 10 years of age, the BMI evolution would differ between anorexic and control subjects. In anorexic subjects, BMI would be higher before adiposity rebound and increase after as fast as it decreases before whereas in controls, it would increase faster. An early screening of anorexia based on both parameters is relevant, improving the prognosis.

FORMAL CAREGIVERS OF SCHIZOPHRENICS IN CALABAR, NIGERIA–THE BURDEN AND EMOTIONAL DISTRESSES

INSTITUTIONS
1. University of Calabar, Department of Psychiatry, Calabar, Nigeria
2. Federal Neuropsychiatric Hospital, Department of Clinical Services, Calabar, Nigeria
3. The Medical College of Winconston, Division of Child and Adolescent Psychiatry, Milwaukee, United States

AUTHORS
1. Emmanuel C. Okereke1, DR, MD, dremmaokereke@yahoo.com
2. Owoidoho E. Udofia1, DR, MD
3. Bassey E. Edet2, DR, MD, drbadet@yahoo.com
4. Olufemi B. Kuteyi3, DR, MD, obkuteyi@yahoo.com

Background: Schizophrenia imposes a considerable burden on the caregivers of the patients who suffered from it. Assessing the psychosocial burden borne by these caregivers is crucial.

Objectives: (1) Assess the burden borne and relate the psychosocial burden to sociodemographic characteristics of patients and caregivers.

Method: This was a descriptive cross sectional study of 84 schizophrenics (42 inpatients and 42 outpatients each respectively) seen at a national psychiatric referral hospital at Calabar over a 3 month period. Their main (formal) caregivers were identified. Goldberg’s questionnaire, GHQ–12 (at a cut off of 3 for caseness and the Involvement Evaluation Questionnaire; IEQ were used to assess the extent of psychosocial burden on the main caregivers. Sociodemographic questionnaire was used for the patients and caregivers. Data was analyzed using SPSS version 11.0 for Windows. Correlations were computed using Pearson’s r with level of significance set at 0.05.

Results: Siblings (38.1%) were the most frequent category of caregivers and the caregivers’ relationship to patients was significant (x^2=13.22, df=4, P=0.04); the GHQ caseness was significant(x^2=18.33, df=1, P=0.019). Caregivers’ had high degree of tension when the patients were of younger age (Pearson r = −0.19, P =0.007) and when the patients were poorly educated(r = −0.21, P = 0.003), they also experienced urge burden when the caregivers’ themselves were poorly educated (r = −0.16, P=0.018).

Conclusion: The burden of caring was responsible for the high GHQ–12 scores (psychological distress). There is the urgent need to offer psychological support like psychoeducation to other family members during patient’s treatments.

ALTERED OSCILLATORY RESPONSES TO VISUAL STIMULI IN BIPOLAR DISORDER REDUCES WITH CHRONIC VALPROATE USE

INSTITUTIONS
1. Dokuz Eylul University, Faculty of Medicine, Department of Psychiatry, Izmir, Turkey
2. Istanbul Kultur University, Faculty of Science and Letters, Brain Dynamics, Cognition and Complex Systems Research Unit, Istanbul, Turkey

AUTHORS
1. Aysegul Ozerdem1, Dr., MD, aysegul.ozerdem@deu.edu.tr
2. Bahar Gunetkin2, Dr., PhD, bgunetkin@iku.edu.tr
3. Zeliha Tunca3, Dr., MD, zeliha.tunca@deu.edu.tr
4. Erol Basar4, Dr., PhD, e.basar@iku.edu.tr

Objectives: Oscillatory electrical activity reflects integrative brain functioning. Valproate is a mood stabilizing anticonvulsant with GABA/Glutamate modulating and neuroprotective effects. We aimed to detect differential oscillatory activity in patients with bipolar disorder before and after treatment with valproate.

Method: Event Related Potentials (ERPs) to target stimuli in visual odd-ball paradigm in twenty medication free (10 manic, 10 euthymic) bipolar patients were measured before and after six weeks of valproate monotherapy in comparison to healthy controls. Different frequency band responses were obtained by digital filtration of ERPs. Repeated measures and one-way ANOVA, Wilcoxon and Mann Whitney U tests were used.

Results: At baseline, euthymic patients showed significantly higher left frontal delta (p: 0.03), whereas manic patients showed significantly higher occipital beta (p: 0.01) and lower occipital alpha responses compared to controls. After valproate, fronto-temporal delta responses decreased significantly compared to baseline in the euthymic group (respective p values for Fz, F3, T3, T4, T5 are 0.04, 0.03, 0.02, 0.01, 0.01). In the manic group occipital (O1–2) beta, occipital and anterior temporal (T3–4) alpha responses showed significant reduction compared to baseline (pO1–2/beta: 0.01 pO1–2/alpha:0.02, pT3–4/alpha:0.04) and became significantly lower than controls (pT3–4: 0.00; pO1–2: 0.02).

Conclusions: Bipolar patients show state dependent altered oscillatory activity which is reduced after valproate treatment. This may be through modulation of GABA/glutamate and indicative of medication’s neuroprotective effect.

3. N Husain3, Dr
4. S McLaughlin4, Ms
5. P Cunningham5, Ms
6. Anthony S David1, Professor, a.david@iop.kcl.ac.uk
7. Peter M Haddad2, Dr

Abstract Body:
Background: Previously, when only typical antipsychotic depot injections were available, some clinicians perceived depots as having an ‘image’ problem despite them being associated with reduced rates of rehospitalisation when compared to tablets. This study investigated psychiatrists’ attitudes and knowledge concerning depots (typical and atypical) and whether they had changed over time.

Method: Cross–sectional postal survey of consultant psychiatrists working in NorthWest England. A pre–existing questionnaire on clinicians’ attitudes and knowledge regarding depots was updated. Results were compared with a former sample (SouthEast England, 2001: N=143).

Results: The sample comprised 102 consultant psychiatrists (response rate 71%). Depot use over the past 5 years had: decreased (50%), not changed (27%), increased (23%). Psychiatrists with decreased depot use had significantly lower scores for the side effects knowledge subscale than those who had unchanged or increased rates of depot use (mean 51.5% vs 54.8%, p=0.029). When compared to psychiatrists sampled five years previously, our current participants had more favourable patient–focussed attitudes (63.5% vs 60.4%, p=0.034); other subscales did not differ. Item–by–item analysis revealed specific changes over time including significantly less respondents regarding depots as: (i) compromissin patient autonomy (mean 0.99 vs 1.28, p=0.036); being stigmatising (1.88 vs 2.42, p=0.002); being old fashioned (1.49 vs 2.04, p=0.002).

Conclusions: During the period that an atypical antipsychotic depot has been available, and depot prescribing rates have reduced, some attitudes have changed. These mainly encompass aspects regarding the patient rather than the depot injection and include reducing concerns about stigma and autonomy although concerns about patient acceptance continue.
NRR-06-03
MOTHER–CHILD TRANSMISSION OF INTERNALIZING SYMPTOMS: IMPORTANCE OF FAMILY CONTEXT

INSTITUTIONS
1. University of Montreal, Psychology, Montreal, Canada
2. Hôpital Rivière-des-Prairies, Research, Montreal, Canada

AUTHORS
1. Genevieve Piche1,2, Mrs, PhD(c), g.piche@umontreal.ca
2. Lise Bergeron1,2, Dr, PhD, lise.bergeron.hrdrp@ssss.gouv.qc.ca
3. Mireille Cyr1, Dr, PhD

This study investigates interaction effects between mother’s depressive and anxiety disorders and psychosocial correlates of children’s internalizing symptom scores in the Quebec Child Mental Health Survey. This research design is unique since this type of interaction was never evaluated 1) with children of this age-group, 2) with scores of internalizing disorders as reported by children, 3) in an epidemiological setting.

A representative sub-sample of 1,490 Quebec children aged 6 to 11 years was selected from the original sample (N=2,400). Methodology has been described elsewhere. A multiple linear regression model was built using scores of internalizing symptoms as reported by children through the Dominic questionnaire, based on DSM-III–R criteria, as the dependent variable. Individual, family and socioeconomic characteristics were used as independent variables.

Significant interaction effects are found between mother’s depressive and anxiety disorders and the following variables: child’s age, family history of suicidal behaviors and mental disorders, mothers’ caring and punitive behaviors and social support.

The findings support the multifactorial and developmental perspective of psychopathology. It suggests a major contribution of the child’s age and of several family characteristics in addition to mothers’ depressive and anxiety disorders, for internalizing symptom scores reported by children aged 6 to 11 years. Implications for preventive interventions targeted at these high-risk groups will be discussed.

NRR-17-04
THE DIFFERENCE IN THE SERUM LEVELS OF BDNF, IL–6, IL–8, IL–10 AND EGF IN ONCOLOGY PATIENTS DIVIDED ACCORDING TO THE PRESENCE OF SYMPTOMS OF DEPRESSION

INSTITUTIONS

4. Zdenek Hess4, Mr., MD
5. Jindrich Fink5, Mr., MD
6. Jiri Beran6, Mr., MD
7. Ondrej Topolcan7, Mr., MD

Objective: To assess the differences in the serum levels of brain-derived neurotrophic factor (BDNF), Interleukin 6 (IL–6), Interleukin 8 (IL–8), Interleukin 10 (IL–10) and Epidermal growth factor (EGF) in oncology patients with the symptoms of depression and in oncology patients without the symptoms of depression.

Methods: We administered following self-report questionnaires to the hospitalized oncology patients (n=32): Zung’s Self-Rating Depression Scale (ZDS) and Symptom Check List Psychiatric Rating Scale (SCL 90). We also collected blood samples from these patients for the detection of the following factors: BDNF, IL–6, IL–8, IL–10 and EGF. The procedures had been fully explained to all patients and written informed consent had been obtained too. The patients were divided into two groups according to the scores in ZDS: a group with the presence of symptoms of depression (n=20) and a group without the symptoms of depression (n=12). The differences in the levels of BDNF, interleukins and EGF between the groups were statistically assessed by Wilcoxon rank–sum test.

Results: Oncology patients with the symptoms of depression showed significantly lower levels of BDNF (medians 1452.3 vs 3229.0 pg/ml, p=0.014). There were no significant differences in the levels of IL–6, IL–8, IL–10 and EGF between the groups.

Conclusion: This result supports the hypothesis of diminished neuroplasticity in oncology patients with the symptoms of depression as measured by the serum levels of BDNF.

This study was supported by the grant of League Against the Cancer 2006–2007 and by the research projects MSM 0021620819 and MSM 0021620812, Charles University and Teaching Hospital Pilsen, Czech Republic.

1. Anto P Rajkumar¹, Dr, MD, DPM, antoprajkumar@cmcvellore.ac.in
2. B Saravanan¹, Dr, DPM, DNB, mantraalaya@hotmail.com
3. KS Jacob¹, Prof., MD, DPM, MRCP,PhD, ksjacobi@cmcvellore.ac.in

**BACKGROUND:** Electro convulsive therapy (ECT) is controversial but widely practised in developing countries like India.

**OBJECTIVES:** This study aims to ascertain patients’ and their relatives’ perspectives on ECT, to compare patients’ and professionals’ perspectives and to compare patients’ and their relatives’ perspectives.

**METHODS:** We employed semi-structured qualitative methodology to interview 52 patients and their relatives before and after ECT. We conducted further in-depth interviews with ten most eloquent patients.

**RESULTS:** 31 (59.6%) patients were unaware of the details of ECT but were not unhappy about their treatment. Patients and relatives assessed benefits and risks of ECT with emphasis on functional recovery. They differed in their willingness to receive more information, the perceived adequacy of their knowledge about ECT, their ability to recall details, and their belief systems. Differences between patients’ and professionals’ perspectives on efficacy and cognitive adverse effects of ECT were not statistically significant.

**CONCLUSIONS:** This study highlights the complex issues in the process of providing information and obtaining consent for ECT in resource poor settings. Pertinent ethical issues are discussed. We suggest feasible strategies to ensure a basic minimum standard for obtaining informed consent for ECT.

**MUSCLE DYSMORPHIA SYMPTOMATOLOGY IN A SAMPLE OF WEIGHT TRAINERS IN ITALY**

**INSTITUTIONS**

1. University of Pisa, Department of Psychiatry, Pharmacology, Neurobiology and Biotechnologies, Section of Psychiatry, Pisa, Italy
2. ASL 3, Department of Mental Health, Pistoia, Italy

**AUTHORS**

1. Carla E Ramacciotti¹, Dr, MD, carlarama2001@hotmail.com
2. Alessandro Bonuccelli¹, Mr, alessandro_bonuccelli@virgilio.it
3. Annalisa Burgalassi¹, Dr, MD, annalisaburgalassi@libero.it
4. Elisabetta Coli², Dr, MD, elisabettagoli@virgilio.it

**Aims:** To investigate body image perception, self-esteem and Muscle Dysmorphia (MD) symptomatology in a sample of 94 male weight-trainers in local gymnasias, categorized as recreational fitness lifters (N=30), amateurs fitness lifters (N=33), non competitive body-builders (N=31).

**Methods:** Subjects underwent psycho-physical assessment comprehensive of the administration of Rosenberg Self-Esteem Scale (RSES), Drive for Muscularity Scale (DMS), Muscle Dysmorphia Inventory (MDI) and body composition evaluation by tetrapolar bio-impedentiometry.

**Results:** Non-competitive bodybuilders showed significantly higher levels of dissatisfaction with their muscularity (DMS) with respect to recreational fitness lifters (p<0.05) and greater symptoms of muscle dysmorphia (MDI) compared to both the other two groups, scoring significantly higher on most subscales (Diet Behavior Size/Symmetry, Physique Protection, Exercise Dependence; pd.001). Though the three groups showed similar levels of self-esteem (RSES), specific correlations emerged for each group. Body Cell Mass and Lean Mass were above normal levels in all groups, with a progressive increase from recreational to amateur fitness lifters and non competitive body-builders; the reverse for Fat Mass.

**Conclusions:** Body dissatisfaction, self-esteem and image distortion appear strictly intertwined not only in Eating Disorders but also in Body Dysmorphic Disorders. As the media representation in western society calls for an idealization of muscularity and body appearance, these issues becomes more relevant even among men and especially vulnerable population such as weight trainers, leading to the identification of increasing cases of MD related psychopathology. Specific prevention programmes should be adopted focusing on the whole spectrum of pathological attitudes towards body appearance disorders, including MD.
LIPIDS AND SEROTONIN AS PREDICTORS OF PHYSICAL SELF HARM IN AN ACUTE PSYCHIATRIC UNIT

4. KG Götestam, Mr, PhD, gunnar.gotestam@ntnu.no

The risk of self-harm and violent behaviour in psychiatric patients is an important research topic. The literature reports a relationship between low lipid concentrations and aggressive behaviour, and between low serotonin- and lipid concentrations and suicidal behaviour. In the acute psychiatric ward at Ålesund Hospital we conducted a prospective naturalistic study of risk assessment of self-harm at admittance and at discharge, followed by prospective measurement of occurred episodes during hospital stay (phase 1) and 3–6–9–12 months after discharge (phase 2).

All acute admitted patients during one year (494 persons with 717 admittances) were included. At admittance and discharge items tapping suicidal thoughts and behaviour and patients’ self-reported risk of self-harm were recorded. At admittance the patients were also asked to give a blood sample to measure lipids (317 samples) and serotonin (286 samples). Statistics were binary logistic regression using Exp(B) as measure of Odds Ratio for suicidal and self-mutilating episodes, using lipids and serotonin as predictive variables, and controlling for different confounders.

Preliminary results from phase 1 indicate that total cholesterol concentrations correlated negatively with suicidality, and triglycerides concentrations correlated with self-mutilation. Serotonin showed no correlation with any kind of self harm.

We will present results from the analyses of the strength of the relationship between lipids and serotonin and occurred suicidal and self-mutilating episodes during hospital stay and one year after discharge.

The project is approved by The regional Committee for Medical Research Ethics, The Norwegian Social Science Data Services and The Ministry of Health and Care Services.

WHOLE-BODY CRYOTHERAPY AS ADJUNCTIVE BIOLOGICAL TREATMENT OF DEPRESSION AND ANXIETY

INSTITUTIONS
1. Wroclaw Medical University, Department of Psychiatry, Wroclaw, Poland

AUTHORS
1. Joanna Rymaszewska, Dr., PhD, ankarym@psych.am.wroc.pl
2. Andrzej Kiejna, Prof., PhD

Objective: to assess the efficacy of whole-body cryotherapy (WBCT) as an adjunctive method of treating depressive and anxiety disorders.

Methods: Control (n=34) and study group (n=26) (18–65 yrs) with depressive and anxiety disorders (ICD-10) received standard psychopharmacotherapy in out-patient psychiatric clinic. There were no differences in age, gender, marital status, education, work ability and diagnosis between both groups. The study group was additionally treated using 15 daily visits (3 weeks) to a cryogenic chamber (2–3 min, from −160°C to −110°C). Hamilton’s scales of depression (HDRS) and anxiety (HARS) were used before and after cycle of WBCT and additionally after 3 and 6 months.

Results: After 3 weeks of WBCT a response (decrease of at least 50% in the baseline scores of depressive and anxiety symptoms) was noted significantly more frequently in the study group. After 3 months the response of anxiety was observed in 23.1% in study group and in 3% in control group (p<0.05) and of depressive symptoms in 34.6% and 3.0% respectively (p<0.01). After 6 months the response concerning anxiety symptoms was still observed (p=0.006). Reduction of symptoms in both time-points was noted in somatic subscale of HARS (p<0.05). During 6 months follow-up AUC analysis showed that combined therapy WBCT with thymoleptics was significantly more effective than standard antidepressive drug therapy.

Conclusions: Our findings are promising concerning the short-term and long-term efficacy of WBCT in treatment of affective and anxiety disorders. WBCT can be considered as adjuvant therapy giving faster reduction of symptoms in comparison to standard pharmacotherapy.

IDENTIFICATION OF EPILEPTICS AND MENTALLY ILL PEOPLE IN THE COMMUNITY BY THE PRIMARY HEALTH ASSISTANTS— A DREAM OR REALITY? A SURVEY IN RURAL INDIA

INSTITUTIONS
1. GLOBAL MENTAL HEALTH INSTITUTE, PSYCHIATRY, India

AUTHORS
1. Hiranmay Saha¹, Dr., MD, dr_hahaha@yahoo.co.in

Aims—The scar that is more than skin deep, the stigma of mental illness, suicide and epilepsy. Depression is universal, a hidden epidemic. 85% of the world’s epileptic patients are not getting proper medicines. 1/8th of world’s epileptic populations are Indian. 1 million people commit suicide every year. WHO decided to involve primary health care assistance for the detection of mentally ill people and epileptics in the society and as a referral service provider. Our aim is to study how far this model is applicable in India.

Methods—A survey was conducted over 600 primary health assistants of different rural areas within 50km periphery of Kolkata city, West Bengal, India through a semi structured questionnaire designed to get information from them about mental illness, suicide and epilepsy and to study there attitude towards all these.

Results—95% of the PHAs are willing to learn about mental illness, suicide and epilepsy. 88% is in opinion that depression is a treatable disease, 89% thought that epilepsy is curable, 68% thinks suicide is a preventable cause of death. 76% think that suicidal people are mentally ill.

Conclusion—Identification of mental patients and epileptics are possible by primary health care assistance. Only thing they need is a continuous training support and encouragement.

DEVELOPING CLINICAL GUIDELINES FOR VIOLENCE RISK ASSESSMENT IN MENTAL HEALTH TRIAGE: A SYSTEMATIC REVIEW

INSTITUTIONS
1. University of Melbourne, Faculty of Medicine, Dentistry, and Health Sciences, Carlton, Melbourne, Australia

AUTHORS
1. Natisha M Sands¹, Dr, PhD, nsands@unimelb.edu.au
2. Stephen J Elsom¹, Dr, PhD, sjelsom@unimelb.edu.au
3. Damien A Khaw¹, Mr, dakhaw@unimelb.edu.au

Abstract Body:

Background
Mental health triage services provide the primary interface between the community and mental health services. On a global level, there is a growing trend to utilise mental health triage service models as a way of providing consumers with access to 24 hour mental health care. At present, violence risk assessment in mental health triage lacks a suitable evidence base and clear guidelines.

Aims
The objective of this study was to develop Clinical Guidelines for violence risk assessment in mental health triage. Four aims underpinned this study:
(1) To locate the highest level of evidence on violence risk assessment through a systematic review
(2) To develop Clinical Guidelines for violence risk assessment in mental health triage based on the findings of the systematic review
(3) To further refine the Clinical Guidelines for violence risk assessment through the use of expert multi-disciplinary panels and consumer groups
(4) To pilot test the Clinical Guidelines in two major hospitals in Melbourne

Method
The method employed in the study was a systematic review, as per the Australian National Health and Medical Research Council’s methodology for developing Clinical Guidelines. Research was also conducted at the Royal Melbourne Hospital and the Alfred Hospital to establish the utility of the Guideline in practice.

Results
The systematic review established the highest level of evidence for violence risk assessment. Clinical Guidelines for mental health triage were developed from these findings.

Conclusions
Evidence based Clinical Guidelines maximise the potential for creating safer outcomes for consumers, families/carers, and health care workers.

Aims: Smooth pursuit eye movement (SPEM) disturbance is one of the most consistent endophenotype in schizophrenia, but there have been a very few reports about the genetic origin. The aim of the current study was to examine the association of eleven G72/G30 snps and Val108/158Met polymorphism of COMT gene with SPEM abnormality in schizophrenia.

Methods: We quantitatively measured SPEM function by electro-oculography and analysis of the natural logarithmic values of signal/noise ratio in 216 schizophrenia patients (male 116, female 100). We divided the patients into two groups according to the SPEM function. We compared the differences of genotype and allele distributions of the eleven snps of G72/G30 gene and Val108/158Met polymorphism of COMT gene among the two groups.

Results: The ln s/n ratio (mean ± sd) of the good SPEM function group was 4.39 ± 0.33 and the ln s/n ratio of poor SPEM function group was 3.18 ± 0.71. There were no statistically significant differences of age and male/female ratio between the two groups. There was a significant difference of genotype or allele distributions of the rs3916970 (M20 G>a) polymorphism on G72/G30 gene between the two schizophrenia groups (P=0.04 by logistic regression analysis). But there was no significant difference of genotype and allele distribution of other ten snps of G72/G30 gene and Val108/158Met polymorphism of COMT gene between the two schizophrenia groups.

Conclusion: The present study provides evidence that the rs3916970 polymorphism on G72/G30 gene might be related to SPEM function abnormality in schizophrenia.

PSYCHOSOCIAL IMPACTS ON PEOPLE WITH MENTAL ILLNESS RECEIVING THE INDIVIDUAL PLACEMENT AND SUPPORT (IPS) SERVICE

INSTITUTIONS
1. The Hong Kong Polytechnic University, Rehabilitation Science, Hong Kong, Hong Kong Special Administrative Region of China

AUTHORS
1. Siu Kan Siu¹, Ms., phoebe@sk@hotmail.com

Objective: The impact of Individual Placement and Support (IPS) approach in helping people with severe mental illness (SMI) on the psychosocial functioning of participants was examined in this study by means of quantitative and qualitative approaches.

Method: One hundred and eleven participants with severe mental illness were recruited from two non-government organizations and three day hospitals in Hong Kong and were assigned into TVR or IPS group. Data of perceived personal wellbeing and self-efficacy using validated scales were collected by an independent assessor at 7th, 11th, and 15th month. Meanwhile, thirteen eligible participants in the IPS group were randomly recruited for the first interview and eight of them who met selection criteria were recruited again for second interview. Data was collected through a tailor-made interview guide during their third and sixth months of employment.

Results: The employed participants in IPS group showed better outcomes in both personal wellbeing and self-efficacy, compared with the TVR group after 15 months of service provision. Results were essentially in line with the qualitative data. Both positive and negative impacts were obtained based on the interviews. A dynamic model was suggested based on the findings to explain the job tenure of participants.

Conclusion: The IPS approach was shown to be effective enhancing psychosocial outcomes for people with severe mental illness in Hong Kong. Suggestions to consolidate the IPS approach were made.

EVALUATING MENTAL HEALTH TARGETS  

INSTITUTIONS  
1. University of Tampere, Tampere School of Public Health, Tampere, Finland  

AUTHORS  
1. Pia C.M. Solin, Mrs, MSocSc, pia.solin@uta.fi  

Objective: This research aims to describe, analyse and assess the evaluation process and results of mental health targets.  

Methods: The research has a grounded theory based orientation. The empirical data consists of official as well as unofficial evaluations of mental health targets of Health for All–based national health strategies of England and Finland.  

Results: It seems that mental health targets are not easy subjects for evaluation. Suicide presents the only quantitative indicator and is therefore easiest target to monitor. For some of the targets there was no available monitoring system at all and therefore evaluation of their advancement was impossible.  

Conclusions: Evaluators should choose tailored evaluation methods. Especially qualitative methods should not be underestimated. There are certain difficulties in evaluating mental health targets and benefiting from them for the future health promotion policy. For example, policymakers may think that mental health cannot produce proper evidence and therefore the action is useless. Furthermore, decision–makers tend to act on changes and emergencies, which mental health rarely produces. Finally, policymakers tend to see mental health as a rival to other health issues, instead of seeing it as part of whole health. Doing evaluation is not a simple process. Tailored evaluation costs time, money and manpower. Effects of the programme may be difficult to point out as behaviour is affected by multiple background factors, as is the case in suicide and mental health problems. Choosing not to evaluate may also be a conscious decision as stakeholders and policymakers may be afraid of unexpected or unwanted results.

LAY CONCEPTIONS REGARDING MENTAL ILLNESS IN ROMANIA: IMPLICATIONS IN DEVELOPPING ANTI–STIGMA PROGRAMS  

INSTITUTIONS  
1. National School of Public Health and Health Services Management, National Center for Mental Health, Bucharest, Romania  
2. Romanian Academy, Institute for Quality of Life Research, Bucharest, Romania  

AUTHORS  
1. Manuela S. Stanculescu, Mrs., PhD, manuela@xnet.ro  
2. Mugur D. Ciumageanu, Dr., MD, mugurc@snpms.ro  
3. Raluca Sfetcu, Mrs., raluca@snpms.ro  

Objectives: Romania started in 2006 an extensive process of reforming mental health care. Part of the national action plan is the implementing of public information and anti–stigma campaigns. The research has as main objective the identification of public attitudes towards mental illness, lay beliefs regarding causality, access to treatment and the prospects of developing evidence–based anti–stigma actions.  

Methods: A representative sample of 1070 persons from the general population was included in a national survey. The questionnaire adapted the devalorization–discrimination scale of Link, used also in research on European population. A second instrument replicated the MacArthur Mental Health Survey from USA, based on a vignette methodology. The survey was conducted in July–August 2007.  

Results: The results illustrate a low level of knowledge of the general public regarding mental health problems and treatment. This low level of information has an negative impact both on attitudes towards people with mental health problems, as well as on access to professional mental health services. Compared with similar research conducted in Germany, Russia and Slovakia, Romanians manifest a stronger potential of excluding, stigmatizing and discriminating persons with mental health problems.  

Conclusions: This study shows that there is a strong need in increasing the level of information in the general Romanian public regarding mental illnesses and how they can be treated, in order to change attitudes and modify social distance towards people with mental health problems. Recommendation to conduct appropriate anti–stigma actions will be discussed.

WEIGHT AND PSYCHOLOGICAL PROBLEMS IN 10–17 YEAR OLD GERMAN PUPILS

INSTITUTIONS
1. University of Applied Sciences Bielefeld, Germany
2. Charité University Medicine Berlin, Germany

AUTHORS
1. Cornelia Thiels
2. Harriet Salbach–Andrae
3. Klaus Lenz

Objective: To study in children and adolescents associations between body mass index (BMI) on the one hand and socio-demographic variables and psychosocial problems on the other hand.

Method: 874 pupils aged 10 to 17 years completed the Youth Self-report (YSR, 1), at least one of their parents the Child Behavior Checklist (CBCL, 1), and one of their teachers the Teacher Report Form (TRF, 1). Socio-demographic data and information about height and weight was also gathered.

Results: Unlike the findings of the nationwide German survey (2) that children and adolescents from families with lower SES had a higher risk for overweight and obesity, the three BMI-groups in our study did not differ in SES SES, age and gender. All CBCL, TRF and YSR mean scores were rated within the normal range. All TRF mean scores were globally higher than CBCL mean scores, and CBCL mean scores were higher than YSR mean scores. Differences between CBCL, TRF and YSR have been found before (1). For overweight participants CBCL, TRF and YSR mean scores were globally higher than for underweight pupils. Higher scores on the scales anxious/depressed and social problems may be due to stigma attached to overweight. The lowest CBCL, YSR and YSR mean scores were found for participants with a normal BMI.

Conclusions: Overweight children and adolescents are more at risk for psychosocial problems than normal or underweight pupils.

ALCOHOLISM RISK FACTORS AND GENDER DIFFERENCES

INSTITUTIONS
1. Institute for mental health, Belgrade, Serbia and Montenegro

AUTHORS
1. Vera Trbic
2. Danica Boakovic–Djukic

Numerous psychosocial factors associated with alcoholism reflect a complex ethiology of this disorder. This study deals with assessment of psychosocial factors of persons addicted to alcohol, with the aim to determine their representation and distribution per gender of assessed individuals in our socio-cultural environment.

The assessed sample included patients who reported for treatment of alcoholism at the Mental Health Institute, Belgrade, in one year (101 persons of male and 67 persons of female gender).

Apart from socio-demographic questionnaire applied was also Alcoholism risk factors inventory (ARFI), which for the first time combines all factors in a unique instrument. By use of statistical method of factorial analysis, isolated were six factors: intrapersonal, social influence, family emotional dysfunction, family history of alcoholism, low socio–economical status and disorderly conduct.

We find representation of particular factors in relation to gender and age: personality factors, particularly low self-esteem and stress reduction by drinking, are to a more considerable extent related to female gender, while the factor of social influence and disorderly conduct are more represented with male assessed individuals, particularly of younger age.

Summed value of all factor is more significantly correlated with alcoholism of persons of male gender, therefore we conclude that men are exposed to a higher risk of alcoholism development due to presence of larger number of risk factors, particularly those of social influence and aggressive behaviour.

In relation to a marital status the factor of social influence was more represented with not married individuals. Marital status is predictor of the fourth factor (low socio–economical status).

THE GROUP, THE OTHERS AND THE SYSTEM – HOW TO BE ABLE TO SHARE THERAPEUTIC GROUP EXPERIENCES ON ACUTE PSYCHIATRIC WARD

INSTITUTIONS
1. Kaposi Mór Teaching Hospital, Department of Psychiatry, Kaposvár, Hungary

AUTHORS
1. Ákos Varga, euroaki@yahoo.com
2. Zoltán Terenyi, terka@t-online.hu
3. Katalin Szőke, PhD, linuka@freemail.hu
4. Zsuzsanna Jáki, opossum@t-online.hu
5. Katalin Sz Csölné
6. Gyöngyi Pál

Objectives: Functioning of an inpatient psychotherapeutic group at a hierarchic, acute psychiatric ward is only possible with the sharing and reflecting of group events by the ward staff. Whether this necessary process can be realized on the level of interpersonal, dialectic relations or, rather, on the level of the system structured by different groups as collective agents.

Methods: Working with acute psychotic patients in a group led by a cotherapeutic team, we examined the external, active and controlled thematization of the group events in two ways. 1. Each member of the team personally chose a topic after the group sessions and communicated it frankly at a common scene of the ward system. 2. Following the sessions the team constructed a “good enough metaphor” (1), which symbolized the given session, then put it out to the public sphere of the ward. The process of the further thematization was followed by the method of participating observation.

Results: Protecting the boundaries of the group are necessary to maintain the inner therapeutic space. Presenting the own inner world is essential in order to joint the superior system. This paradox carries on a constant dynamic tension in the inner and outer environment.

Conclusion: The thematization of the group events outside the group can avoid being destructive only if the reflection of this is possible inside the group. Therefore it’s necessary for each member of the team to respect the therapeutic frames both personally, and as a group.

STATISTICAL CORRELATES OF ELEVATED TEMPERATURE IN NMS

INSTITUTIONS
1. University of Western Ontario, Psychiatry, London, Canada

AUTHORS
1. Varadaraj Velamoor, Dr., MD, velamoorraj@yahoo.com
2. Zack Cernovsky, Dr., PhD, polyglot@acmedi.com
3. Simon Chiu, Dr., MD, schiu3207@rogers.com

Aims/Objectives: Major systems for diagnosing NMS unconditionally require the presence of elevated temperature (> 37.1°C by DSM–4 and > 38.0°C by Caroff’s system). We evaluated statistical relationships of temperature to other physiological and behavioral symptoms relevant in the research on NMS.

Methods: Data from a survey of 233 suspected NMS cases (mean age 40.8 years, SD=17.9) from various centers across USA and Canada have been analyzed: the majority (83.7%) met DSM–4 criteria for NMS. Correlations were calculated of temperature to other vital signs (BP and pulse), to laboratory measures (Creatine Kinase, WBC, PH, P–O2, P–CO2), and to ratings of behavioral symptoms (rigidity, dysarthria, dysphagia, agitation, coma, etc.) relevant in the NMS research.

Results: More than two thirds of the sample (71.7%) had recorded temperatures above 38.2°C. More than half of the sample (56.2%) had recorded temperatures of at least 39°C, 33.9% of the patients at least 40°C, 5.2% at least 41°C, 16.3% at least 42°C, and the highest recorded temperature was 43.0°C. Higher temperature was associated with less elevated systolic (r=−.19, p=.004) and diastolic blood pressure (r=−.20, p=.003), with lower frequency of waxy flexibility (r=−.20, p=.003), with more frequent autonomic instability (r=−.20, p=.003), and also with the presence of coma (r=.20, p=.003). Although significant, these coefficients are of low magnitude, suggestive of only weak trends.

Conclusion: No high correlations (r>.60) of temperature to other NMS signs were found: in this statistical respect, temperature may be a relatively independent dimension in the evaluation of NMS.
Objective: Converging evidences exist for altered cortical activity, as revealed by functional MRI (fMRI), in major depressive disorder (MDD), in particular in the pregenual anterior cingulate cortex (pACC). This region is characterized by deactivations during a variety of tasks and is involved in subjective evaluation of internal states by attributing hedonic values. Earlier studies in MDD found decreased concentrations of glutamate in the pACC using magnetic resonance spectroscopy (MRS). The aim of our study was to relate altered fMRI responses in MDD to specific metabolic alterations.

Methods: We investigated 24 healthy subjects and 16 MDD patients in a combined fMRI/MRS study on a 3 tesla scanner: The fMRI session used an event related design which included both passive viewing and subjective judgement of visual emotional material. MRS sessions used single voxel acquisitions of the pACC with a two dimensional JPRESS sequence which allowed spectral differentiation of GABA, glutamate and glutamine.

Results: Both patients and controls showed reliable negative bold responses (nbr) in pACC during picture presentations, with significantly stronger nbr in controls. Nbr correlated with GABA concentrations in the pACC only in the healthy controls while a correlation between nbr and glutamate levels was found for MDD patients only. Glutamine showed correlations with nbr for both groups. Glutamine levels in the pACC differed also between patients and controls and between highly anhedonic patients and patients with low anhedonia scores.

Conclusion: We could show that altered glutamate/glutamine cycling is related to neuronal abnormalities and state parameters like anhedonia.

NRR-02-04
CAN WE BELIEVE META–ANALYSIS? THE CASE OF VENLAFAXINE VS SSRIS

Objective: There is an increasing number of newer antidepressants available claiming superiority compared to older ones. These claims need to be proven by meta–analysis. However, different meta–analyses may show differing results. The aim of this review was to evaluate the influence of methodological issues on the meta–analysis effect sizes in the case of venlafaxine vs. selective serotonin reuptake inhibitors (SSRIs) in major depression.

Methods: Following a systematic literature search, we pooled data on depression scores, response, remission and dropout rates. A number of sub–group analyses were performed.

Results: We could include seventeen studies. There was no significant superiority in remission rates (risk ratio [RR]=1.07, 95% confidence intervals [95%CI]=0.99 to 1.15, numbers needed to treat [NNT]=34) and a small superiority in response rates (RR=1.06, 95%CI=1.01 to 1.12, NNT= 27) over SSRIs. We found a small advantage to venlafaxine in change scores (effect size=−0.09, 95%CI=−0.16 to −0.02, p=0.013), which did not reach significance when posttreatment scores were used (effect size=−0.06, 95%CI=−0.13 to 0.00). Discontinuation rates due to adverse events were 45% higher in the venlafaxine group. The main reasons for the differences between this analysis and previous industry sponsored reviews were the exclusion of low–quality–studies, avoiding to pool selectively reported study results and exclusion of studies available as abstracts only.

Conclusion: This analysis does not support a clinically significant superiority of venlafaxine over SSRIs. It seems that not only publication bias but also the choice of meta–analysis methodology may contribute to the inflation of antidepressant effect sizes.

A NEW VERSION OF INTEGRATED GROUP THERAPY FOR BIPOLAR DISORDER AND SUBSTANCE DEPENDENCE

INSTITUTIONS
1. Harvard Medical School, Boston, United States
2. McLean Hospital, Alcohol and Drug Abuse Treatment Center, Belmont, United States
3. West Chester University, Department of Mathematics, West Chester, United States

AUTHORS
1. Roger D Weiss, Dr., M.D., rweiss@mclean.harvard.edu
2. Margaret L Griffin, Dr., Ph.D., mgriffin@mclean.harvard.edu
3. William B Jaffee, Dr., Ph.D., wjaffee@mclean.harvard.edu
4. Rachel E Bender, Ms., rachel.e.bender@gmail.com
5. Fiona S Graff, Ms., fionagraff@gmail.com
6. Robert J Gallop, Dr., Ph.D., rgallop@wcupa.edu

Aims
Bipolar disorder (BD) is the Axis I disorder with the highest risk of a co-occurring substance use disorder (SUD). However, treatment of patients with both disorders is understudied. We developed a manualized cognitive-behavioral treatment, Integrated Group Therapy (IGT), focusing on similarities in recovery from BD and SUD. In a previous randomized controlled trial, IGT was more effective than standard Group Drug Counseling (GDC) in reducing substance use. We conducted an effectiveness trial using substance abuse counselors with no previous CBT training, and reduced treatment from 20 to 12 sessions to increase feasibility.

Methods
A randomized controlled trial (N=61) compared 12 weekly sessions of IGT to GDC, with a 3-month post-treatment follow-up. We hypothesized that IGT patients would have fewer days of substance use and fewer weeks ill with a mood episode than GDC patients.

Results
Although patients in both treatment groups reduced their substance use and experienced mood improvement during treatment, IGT had better substance use and mood outcomes than GDC. During treatment, more IGT patients achieved complete abstinence, and IGT showed a trend toward fewer days of substance use during follow-up. Further, IGT patients had fewer weeks ill with mania than GDC patients during follow-up.

Conclusion
These findings corroborate earlier results showing that IGT is more effective than GDC for patients with BD and SUD. This study also demonstrates that substance abuse counselors can be trained to implement this intervention effectively, and that a shortened version of IGT remains effective.

HEALTH-RELATED QUALITY OF LIFE IN RESTLESS LEGS SYNDROME IN THE SLEEP HEART HEALTH STUDY

INSTITUTIONS
1. Brigham and Women's Hospital, Division of Sleep Medicine, Boston, United States
2. Harvard Medical School, Boston, United States
3. Boston University School of Medicine, Boston, United States
4. V.A. Boston Healthcare System, Boston, United States

AUTHORS
1. John W. Winkelman, Dr., M.D., Ph.D., jwinkelman@sleephealth.com
2. Daniel J. Gottlieb, Dr., MD, MPH

Objective: This is an examination of the relationship between Restless Legs Syndrome (RLS) severity and health related quality of life (HRQOL) in a large community based study.

Methods: This is a cross-sectional observational study of 1271 men and 1550 women (mean age of 67.4 years) enrolled in the Sleep Heart Health Study, a community-based study of the cardiovascular consequences of sleep–disordered breathing. RLS was defined by positive responses on a self-administered questionnaire to the four IRLSSG diagnostic criteria, with symptoms occurring at least five times per month and associated with at least moderate distress. HRQOL was determined using the SF–36, a 36 item self-report instrument. Data were assessed using general linear models with adjustments for multiple covariates.

Results: RLS was associated with decrements in all physical domains of the SF–36 (Physical Functioning, Role Physical, Bodily Pain, General Health perception, and Vitality, all p<0.0001 except Role Physical, p=0.013). Higher frequency symptoms were associated with worsened scores for Bodily Pain and General Health. More bothersome symptoms were associated with worsened Physical Functioning. In the psychological domains, RLS was observed to have a negative effect on the Mental Health domain (p= 0.0272), but not on Social Functioning or Role Emotional domains. More frequent and more bothersome symptoms were associated with worse Mental Health scores.

Conclusion: This data further documents HRQOL decrements in RLS, and demonstrates that RLS severity, as measured by symptom frequency and bothersomeness, independently contributes to reductions in HRQOL.
Objective: Brain–derived neurotrophic factor (BDNF) may play a role in the etiology of nicotine dependence and susceptibility to schizophrenia. Since schizophrenics also have a substantially increased rate of smoking, BDNF genes may be one of the factors connecting smoking to schizophrenia. The present work was therefore undertaken to examine the association of smoking in Chinese schizophrenics with two BDNF polymorphisms: −196G/a (Val66Met) and −270C/t.

Method: The two polymorphisms were studied in 149 unrelated male schizophrenics, including 101 smokers and 48 non-smokers. Genotyping was performed via restriction fragment length polymorphism analysis. Serum BDNF levels were measured by sandwich ELISA.

Results: Individuals with G alleles (G/G+G/a genotypes) of BDNF−196G/a demonstrated a 1.5 fold increased risk of smoking compared to those with a/a genotype (95% CI: 1.0–2.37, p=0.05). The combination into haplotypes showed that men with 196G+/270t+ and 196G+/270t− haplotypes had an approximately 3.6 and 2.7 fold increased risk of smoking, respectively, compared to those with 196G−/270t− haplotype. Furthermore, smokers had higher BDNF serum plasma levels than non−smokers (p<0.05). The G/G or G/A genotype in combination with high BDNF levels raised smoking risk in schizophrenia significantly when compared to those with low BDNF levels and the A/A genotype (OR=1.85; 95% CI: 1.17–2.78, p=0.007).

Conclusion: Our findings suggest that the G196A polymorphism in the BDNF gene, or another mutation in linkage disequilibrium with G196A, combined with high BDNF levels increases smoking risk in Chinese schizophrenics.
The objective of this paper is to present findings from a study that examined physician beliefs and attitudes about the use of algorithms in the treatment of psychiatric patients, the perceived barriers to use of algorithms, and the methods that physicians used to educate themselves about best practice.

The study employed a qualitative methodology in order to more fully understand the physician’s experience. Ethnographic methods used included focus groups, in-depth interviews using a semi-structured interview format, and participant observation over a two year period. All interviews were audiotaped, transcribed, and independently coded by two members of the research team, a psychiatrist and a therapist.

Study findings were consistent with literature that suggests that complex barriers limit the impact of clinical practice guidelines on physician behavior and that strategies to improve physician adherence may not be generalizable from one clinical setting to another (1). In diverse psychiatric practice settings that were the subject of this study, physicians were not resistant to the use of credible practice guidelines in principle. Use of practice guidelines were considered, instead, in the context of complex clinical reasoning and a collaborative physician/patient relationship. Several examples of the unique employment of guidelines in the care of psychiatric patients will be presented.

Successful implementation of credible clinical practice guidelines in psychiatric settings hinges on a rich appreciation of the physician/patient relationship and the culture in which it occurs.

PSYCHOPATHOLOGY, INSIGHT AND TREATMENT COMPLIANCE IN SCHIZOPHRENIA: A FOUR WEEK LONGITUDINAL STUDY

INSTITUTIONS
1. Institute of Human Behaviour and Allied Sciences, Psychiatry, Delhi, India

AUTHORS
1. Vikrant Bajaj¹, Dr., MD, drvikrantbajaj@yahoo.co.in
2. Somnath Sengupta¹, Dr., MD
3. Dhanesh Kumar Gupta¹, Dr., MD

A four week longitudinal study was conducted to assess the relationship between insight, psychopathology and treatment compliance in schizophrenia using Insight and Treatment Attitude Questionnaire (ITAQ), Positive and Negative Syndrome Scale (PANSS) and Medication Adherence Rating Scale (MARS). Study sample consisted of 50 patients with schizophrenia diagnosed according to the research criteria of International Classification of Diseases [ICD - 10] with a mean period of illness being 5.32 years. There was substantial psychopathology at intake which improved significantly after 4 weeks. Similar changes were found with the scores of insight and compliance over 4 weeks. Insight and compliance were positively correlated to each other at intake and at the end of 4 weeks. Both of these were negatively correlated with psychopathology scores on both the occasions. On stepwise logistic regression, compliance on first visit was predicted by insight [63.6%] and psychopathology [16%] while on second visit compliance on first visit and insight significantly predicted compliance and psychopathology didn’t have any significant influence on it.

OC-01-02
SCHIZOPHRENIC DISORDERS AMONG FIRST AND SECOND GENERATION IMMIGRANTS TO ISRAEL

INSTITUTIONS
1. Brown University, Department of Psychiatry and Human Behavior, Providence, RI, United States
2. Mental Health Services, Ministry of Health, Jerusalem, Israel

AUTHORS
1. Robert Kohn¹, MD, Robert_Kohn@brown.edu
2. Itzhak Levav², MD, ITZHAK.LEVAV@moh.health.gov.il

Aims: The debate of the role of social causation versus social selection factors in schizophrenia continues [1]. The social-causation hypothesis was tested by examining if ethnically disadvantaged groups had higher treated incidence rates for schizophrenia than their advantaged counterpart, and if immigrants had higher rates than non-immigrants.

Methods: Israel-born subjects first hospitalized during 1977 and 2003 were selected from the national psychiatric case register. Immigrants were selected based on the range of years of birth comparable to those of parents of the non-immigrant sample.

Results: All immigrants had higher incidence rates than Israel-born individuals. The two most disadvantaged immigrant ethnic groups had the highest incidence rates. The first generation of immigrants had statistically significantly higher incidence rates of schizophrenia than their second-generation counterparts.

Conclusions: This study supports a role for social causation in schizophrenia, and confirmed the existence of an association between migration and schizophrenia [2]

ATYPICAL NEUROLEPTICS TREATMENT OF SCHIZOPHRENIC PATIENTS

INSTITUTIONS
1. Mental Health Research Institute, Russian Federation

AUTHORS
1. Olga Lobacheva
2. Tamara Vetlugina
3. Arkady Semke
4. T. G. Burdovitsina

Objective: The investigation of therapeutic efficiency, dynamics of immune parameters and aminotransferases serum level of schizophrenic patients during 6-week therapy atypical neuroleptics.

Methods: We examined 58 schizophrenics (22 patients quetiapine (Seroquel) treatment, 12 olanzapine (Zyprexa) treatment, 12 risperidone (Rispolept) treatment, 12 amisulpride (Soliyan) treatment) in two points: first before the prescription of atypical neuroleptics, second in 6 weeks of treatment. The psychometric estimation on scales PANSS and CGI was used at clinical examination. We defined the parameters of cellular immunity (phenotyping of surface receptors of immunocompetent cells with using of homogeneous antibodies), humoral immunity (IgG, IgA, IgM, level of circulating immune complexes in blood serum) and serum levels of aspartate (S”) and alanine aminotransferases (L”) of schizophrenics.

Results: The research has revealed positive changes of psychopathological symptomatology on a scale PANSS: decrease of the total estimation on 25-36 %, a total number of positive symptoms on 20-41%, negative on 25-32% and general psychopathological on 25-36%. In first point of examination of schizophrenics the ”-immunodeficiency was determined; authentically high S” and L” levels were observed in groups of patients treated by olanzapine and quetiapine. Immunomodulatory effect on the -cells immunity after olanzapine and risperidone treatment and immunosuppression effect on the -cells immunity after amisulpride treatment is established. S” and L” levels reduced up to the control indices during of olanzapine and quetiapine treatment.

Conclusion: Atypical neuroleptics render various influence on immune parameters. Dynamics of aminotransferases level which depends on their initial level is marked.

NEW DIAGNOSTIC AND TREATMENT APPROACHES TO SCHIZOPHRENIA WITH OBSESSIVE-COMPULSIVE SYMPTOMS

INSTITUTIONS
1. Laboratory of Biological Psychiatry, Felsenstein Medical Research Center, affiliated to Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel
2. Psychiatry Department, Barzilay Medical Center, affiliated to Ben Gurion University of Negev, Beer-Sheva, Ashkelon, Israel

AUTHORS
1. Ilya Reznik, Dr., M.D., ilyarez@netvision.net.il
2. Mila Reznik, Dr., M.D.
3. Abraham Weizman, Prof., M.D.

Background: Obsessive-compulsive (OC) symptoms have been observed in a substantial proportion of schizophrenia patients. The complex nature of the treatment response of OC and schizophrenia symptoms is as yet unclear. Here we present our model of the clinical typology of schizophrenia with prominent OC symptomatology and some possible predictors of response of OC and schizophrenia symptoms on some atypical antipsychotic agents (AAAs).

Methods: This case series study describes our experience with clozapine, risperidone, olanzapine, quetiapine, ziprazidone and amisulpride as sole agents and in combination with serotonin reuptake inhibitors (SRIs): clomipramine, fluvoxamine, fluoxetine, paroxetine, citalopram, sertraline, in patients with OCD-schizophrenia (n=41) and schizo-obsessive disorder (n=44).

Results: In OCD-schizophrenia the better results were achieved in combination with SRIs, while the olanzapine showed the fastest overall improvement. In schizo-obsessive patients AAAs as monotherapy was the better therapeutic modality, and the risperidone showed the best results. Quetiapine, amisulpride and ziprazidone were approximately equal in their antipsychotic and antiobsessive activity and overall safety.

Conclusions: The effects of different AAAs (with or without SRIs) on psychotic and OC symptoms are vary, probably due to different origin of OC symptoms. Based on the clinical typology of OC symptoms in schizophrenia, we suggest that: 1) schizo-obsessive patients might be successfully treated with AAAs alone; 2) in OCD-schizophrenia AAAs monotherapy may be less efficient and in some cases even may worsen OC symptoms, so it should be treated concomitantly with SRIs. Further investigations are needed to substantiate our observations and to elaborate the most effective and safe approach to these difficult-to-treat group.

4. Yuri Gimelfarb

BACKGROUND: The prevalence of obesity among schizophrenic patients in Israel is increasing. No systematic assessment of the actual nutritional composition of the diet of schizophrenic patients in Israel has been carried out. For that reason we conducted a survey based on the first National Health and Nutrition Survey (Israeli Ministry of Health, 2004).

AIM: The aim of this study is to formulate a basis for the evaluation of health and different nutritional variables indicators in schizophrenic patients, and to identify of sub-population groups at increased risk of morbidity.

METHODS: A face to face interview was completed in 30 acute and 30 chronic schizophrenia inpatients to gather information on demographic variables, different nutritional variables, knowledge and attitudes regarding nutrition, health status, alcohol intake, exercise and smoking habits.

RESULTS: BMI of chronic patients [BMI < 20.0 in 4 (13.8%) of subjects] was significantly higher than of acute patients [BMI > 35.0 in 4 (13.8%) of subjects] (likelihood ratio = 12.8; df = 4; p < .012), but were no differences in nutritional status (NS) and eating habits (NS).

CONCLUSIONS: The results can be used by health organization to evaluate the existing programs and government policies and to plan future ones.

4. António Marques

Neurofeedback or electroencephalogram (EEG) biofeedback is a technique developed to train self-regulation of a specific aspect of the electrical activity of the brain. It has been used successfully in the treatment of several disorders (e.g., Depressive and Bipolar Illness, Epilepsy, Substance Abuse, Attention Deficit Disorders and Learning Disabilities, Traumatic Brain Injury) using different treatment protocols. Despite accumulation of evidence showing the efficacy of this treatment, few studies reported its use with schizophrenic patients. In this sense, the aim of this presentation is to discuss the clinical protocol which will be used during a program of cognitive remediation of patients diagnosed with Schizophrenia. Literature review suggests that self-regulation of cortical excitability and the alteration of interhemispheric asymmetry through learned control may be a useful application of EEG Biofeedback. Moreover, several Neurofeedback protocols used to treat other disorders were shown to be effective improving attention, motivation and self-control, making them good options to help persons with Schizophrenia to train brain toward stability.

HOW GOOD IS 'GOOD OUTCOME' IN SCHIZOPHRENIA? OBSERVATIONS FROM A TEN YEARS 'LONG-TERM STUDY OF SCHIZOPHRENIA' AT MUMBAI

INSTITUTIONS
1. University of Western Ontario, Psychiatry, London, Canada
2. PRERANA Psychiatric Services, Silver Mind Hospital, Mumbai, India

AUTHORS
1. Amresh Shrivastava, Dr., MD, MRCPsych, dr.amresh@gmail.com
2. Meghana Thakar, Mrs., MA, meghana2711@yahoo.co.uk

Introduction: The illness of schizophrenia has always been a matter of concern for its nature and extent of outcome particularly for its regional and cultural differences. The concept of outcome has been evolving and this study examines the 'real-life -state of recovery' amongst recovered patients.

Methods: Re-examination of recovered patients in ten years long term, naturalistic, prospective study using Meltzer et al's 13 outcome criteria.

Results: The recovered patients (N=67, 62.7% on CGIis) of available 107 at ten years had deferential outcomes. 70% had persisting positive symptoms, 53% had negative symptoms, present in some form. 76% patients were free from EPS side effects; 62% had improved in Interpersonal function; 43% were capable of independent living; 50% showed cognitive decline; 68% showed improved quality of life; 38% had hospitalization within previous 2 year; 60% had significant family burden and 32% some or the other kind of social burden; 23% were still living with suicidal thoughts, Less than half resumed work/school and sustained; 58% had GAF more than 80.

Conclusion: The study reveals that clinical profile of CGIs 'Good Outcome' in long term is not as bright as expected. More than 50% patient in fairly recovered group live with varying degrees of disability.

COMPARISON OF ORAL AND DEPOT RISPERIDONE TREATMENT ON C-FOS EXPRESSION, AND ITS EFFECTS ON SEROTONIN AND DOPAMINE LIKE RECEPTORS IN SCHIZOPHRENIC PATIENTS

INSTITUTIONS
1. Quinte Health Care, Psychiatry, Belleville, Canada
2. Queen's University, Psychiatry, Kingston, Canada

AUTHORS
1. Amarendra N. Singh, Professor/Dr., MD, FRCP (C), asingh@qhc.on.ca

Risperidone is now one of the most commonly prescribed antipsychotic drugs in the world. Recent innovations in drug formulation have contributed to the availability of risperidone in both oral and depot preparations. A liquid formulation of risperidone is also currently available which may be useful in psychoagitation. A depot formulation of risperidone has been developed for the long-term control of psychotic symptoms and to avoid daily oral administration. We have previously reported the effect of risperidone on c-fos expression in various rat brain regions (Singh et al. BAP 2002). The aim of the present study was to compare the effect of oral and depot risperidone administration on c-fos expression, dopamine D2-like and serotonin receptors in schizophrenic patients. A double-blind study paradigm was utilized to investigate the effects of two risperidone preparations. C-fos, D2-like dopamine and serotonin receptor expression were measured in lymphocytes and platelets respectively at various times (0, 6, 12 weeks) after treatment. Both oral and depot formulations of risperidone significantly increased c-fos expression at 6 and 12 weeks following treatment. Similarly, both preparations of risperidone significantly down regulated both D2-like dopamine and serotonin receptors. The results of this study show that both oral and depot formulation of risperidone were equally effective with respect to risperidone's ability to increase c-fos gene expression and neurotransmitter receptor regulation in schizophrenic patients.
Objective: Schizophrenia is a chronic debilitating psychosis. Type 2 diabetes mellitus has been noted to have an increased prevalence in patients with schizophrenia compared with the background population. This study investigated if type 2 diabetes mellitus is a predictor of in-hospital mortality in schizophrenia.

Methods: During 2000-2007, 679 patients with schizophrenia were admitted to University Hospital Birmingham NHS Trust. Predictors of in-hospital mortality were calculated using the Cox regression model.

Results: Of the 679 patients with schizophrenia, 100 patients died in hospital. The predictors of in-hospital mortality in schizophrenia were shown to be age ($p<0.001$), diabetes ($p=0.024$) and heart failure ($p=0.001$). The relative risk of in-hospital mortality in patients with schizophrenia and type 2 diabetes mellitus is 1.80.

Conclusion: Diabetes has been found to be a predictor of in-hospital mortality in schizophrenia. This is a new finding, with research so far identifying a link between an increased likelihood of diabetes in patients with schizophrenia but not as a predictor of in-hospital mortality. Therefore, clinical practice should include rigorous monitoring of type 2 diabetes mellitus in patients with schizophrenia.

PROMOTING POSITIVE MENTAL HEALTH IS THE KEY IN PREVENTING PSYCHIATRIC ILLNESS

INSTITUTIONS
1. Cacutta Pavlov Hospital, Kolkata., Psychiatry, Kokata (Calcuta), India

AUTHORS
1. Asis Krishna Acharya, Dr., DPM, DIH., dr_asisacharya@yahoo.com

OBJECTIVES: WHO defines health as: ...a state of complete physical, mental and social wellbeing and not merely the absence of disease or infirmity. Mental health is described by WHO as: ...a state of wellbeing in which the individual realizes his or her own abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community. There is no health without mental health. Promoting mental health can be enhanced by suitable public health measures, also with contribution by several associated agencies like education, nutrition. Social services, labour and many others with politician's wish too.

METHODS: Intervention for mental health promotion can starts even before birth. Home visitation during pregnancy and child-birth up to 2years is the first crucial period. Home visits by professionals reduce the psychiatric and behavior anomolys as detected by behavior check list(CBCL).Parent training(2-5yrs) School-based programmes (5-18), and community programme integrated with general multi-purpose health programme, when planned and implemented have a reduction in childhood-adolescent mental disorders. Job pre-placement & periodical check-up, intervention and early diagnosis and early treatment can promote the mental health at large. Healthy cultural activities, sports, music, art, literature or other creative activity will promote mental health.

RESULTS: Results in health promotion scheme in reducing school drop-out, preventing suicidality is well documented. Early in 20th century mental hygiene movement succeeded in putting mental health promotion on the international agenda. Some 200 studies during past 30 years have been published on mental health promotion.

CONCLUSIONS: Tiny no. of clinician and treating mental disorder in isolation, without the wider dimension of schemes for promoting mental health, will fail to achieve totality in preventing mental disorders.

THE ADAPTIVE BIOLOGY OF KINSHIP, PUBLIC POLICY AND THE PREVENTION OF CHILD ABUSE

INSTITUTIONS
1. University of Washington, Psychiatry, Seattle, United States

AUTHORS
1. Mark T. Erickson¹, Dr., MD, merickson@southcentralfoundation.com

Aims: Although there is agreement that child abuse and neglect create an enormous public health burden there is a relative dearth of research on its prevention. This dilemma is not due primarily to a lack of data. Rather, there is a need to integrate findings from different disciplines on the adaptive biology of kinship to inform clinical models and public policy for abuse prevention.

Method: Research on the biology of kinship from various disciplines including evolutionary theory, ethology, anthropology, and behavioral endocrinology are reviewed and contrasted with relevant clinical data and public policy.

Results: Cross-disciplinary research could effectively improve efforts to prevent child abuse. Two of many possible examples will be discussed. One: There has been compelling evidence for a biological adaptation for incest avoidance, from ethology and anthropology (the Westermarck effect) for over 30 years, yet with rare exception complementary studies have not examined this finding at the level of behavioral endocrinology or clinical research. Two: Parental leave policies in Europe and the US have been developed without reference to the biology of kinship. There are striking differences across nations in mortality rates due to child abuse. Ethological and endocrine research suggests how parental leave policies may contribute to a greater or lesser prevalence of this most severe form of child abuse. Conclusion: Cross-disciplinary integration of the biology of kinship is critical for developing optimal programs for preventing child abuse and neglect.

DYNAMIC OF COPING-STRATEGIES AND COLOR PREFERENCES IN FORMATION OF NEUROTIC DISORDERS

INSTITUTIONS
1. Mental Health Research Institute, Preventive Psychiatry Department, Tomsk, Russian Federation

AUTHORS
1. Irina S. Karaush¹, Mrs., niipz@sibmail.com
2. Irina E. Kupriyanova¹, Dr., MD, niipz@sibmail.com

We examined 120 patients (2 groups - persons with single symptoms of neurotic spectrum (50 persons) and with neurotic disorders (70 persons, from them - 25 persons with anxious-phobic disorders (F-40 according to ICD-10), 25 with adjustment disorders (F-43), 10 with dissociative disorders (F-44) and 10 with somatoform disorders (F-45)). We assessed strategies of coping with difficulties with questionnaire of coping behavior developed by E. Heim based on study of psychological stress by L. Murphy and R. Lazarus. Among preferred strategies, patients with initial neurotic manifestations distinguish adaptive strategies “analysis of problem” and “maintenance of self-control” - 70% and 52%; patients with neurotic states choose these strategies more seldom. The third preferred strategies in both groups are maladaptive: patients of group 1 present with “ignorance” (30%), in patients of group 2 in 45,71% of cases we documented “submission”. Dynamic of preferences is noticed (in emotional domain) from relatively neutral position (“passive cooperation”) (48% in patients with single psychopathological symptoms) to severe autoaggressive trends - strategy “suppression of emotions” in 47,14% of patients with neurotic disorders. Relatively adaptive strategy “destruction” (42% in patients of group 1) is replaced by “resentment” manifesting through isolation and strive to remain one by him/herself. During analysis of color preferences (Lusher test) we reveal a reliable preference by patients with neurotic disorders of violet color (47,14%), refusal of “working” or “active” colors. Patients of group 1 demonstrate in first positions classical “working group” - yellow (66% of cases), green (64%), red (62%).

MUSIC APPRECIATION AND INTERVENTION ON STRESS INDUCTION: A RANDOMIZED CROSSOVER TRIAL

INSTITUTIONS
1. Tzu Chi University, Nursing, Hualien, Taiwan Republic of China
2. Buddhist Tzu Chi General Hospital, Nursing, Hualien, Taiwan Republic of China

AUTHORS
1. Hui-Ling Lai¹,², Dr., PhD, snowjade@mail.tcu.edu.tw

Objectives: The purpose of this randomized cross-over controlled trial is to examine the effects of music preference and intervention on stress indices.

Method: Using a cross-over design, 54 subjects were randomly assigned to music / chair rest or chair rest/music sequence. Subjects were in each sequence for 30 minutes. Subjects in the music condition listened to selected-sedative music by headphones throughout 30 minutes. In the chair rest condition subjects sat quietly for 30 minutes. Using a repeated measures design, subjects’ heart rate, mean arterial pressure, finger temperature, and cortisol were measured with BP monitor and chemillumincent immunoassay respectively before the study and every 15 minutes interval until the end of the whole procedure.

Results: The mean music appreciation scores was ranged between 7 and 10, with a mean score 8.81 (SD = 1.05), and was significantly associated with mean arterial pressure, cortisol, self-perceived stress, and finger temperature. Subjects when listened to music compared with chair rest had lower perceived stress level, cortisol, heart rate, and mean arterial pressure as well as higher finger temperature (all p < 0.05 to 0.001). Paired t-test results were also significant for posttest heart rate, cortisol, finger temperature and mean arterial pressure between the two conditions (p < 0.05 to 0.001).

Discussion: The effect of music on stress was confirmed, the findings provided evidence for nurse to use soothing music as a research-based nursing intervention for stress reduction.

CONFROTATION IN THE INITIAL INTERVIEW

INSTITUTIONS
1. Psychiatric office ‘Dr Lekic’, Podgorica, Serbia and Montenegro

AUTHORS
1. Zvezdan Milorad Lekic¹, neuropsihiatrist, MD, zvezdanleki@cg.yu

My principal objective of this work is to illustrate the clinical usefulness of confrontations in the initial interview. Among many authors Balint, Kernberg, Fromm Reichmann, Sullivan pointed out importance of initial interview and the consequences of the interview for the future psychotherapeutic work. Initial interview represents two persons, therapist and the persons who needs help, who doesn’t know anything about each other and meet for the first time. Interaction between therapist and patient through communication is a major source of information in initial interview. The nature of disorder, capacity and motivation for psychotherapy can be evaluated in the current interaction with the person who needs help. In the initial interview we can establish an immediate link between the patient’s psychopathology and the indications for psychotherapeutic treatment. Confrontation is a routine technique in psychoanalysis and psychotherapy, unilateral and potentially dangerous, especially when working alliance is not established and that’s the case in the initial interview. Purpose of confrontation in the initial interview is to collect information about patient, his psychopathology, his structural personality features, presence of defensive operations, capacity and motivation to work and what kind of psychotherapy is best suited for him. Confrontation can be very harmful so it requires tact and patience.

CHILDREN AND PARENTS WITH MENTAL DISORDERS: RANDOMIZED CONTROLLED TRIAL TO PREVENT CHILDHOOD DEPRESSION - PRELIMINARY RESULTS

INSTITUTIONS
1. National Research and Development Centre for Welfare and Health (STAKES), Helsinki, Finland
2. University of Tampere, Department of Psychology, Tampere, Finland

AUTHORS
1. Juulia Paavonen¹, Dr, MD PhD, juulia.paavonen@helsinki.fi
2. Raija-Leena Punamäki², Professor, PhD, raija-leena.punamaki@uta.fi
3. Tytti Solantaus³, Professor, Md PhD, tytti.solantaus@stakes.fi

Aims/Objectives
Children whose parents have depression are at a higher risk than other children to be diagnosed with a psychiatric disturbance. The objective of the present study is to compare the Beardslee family intervention to the control intervention in preventing children's psychiatric symptoms.

Methods
The complete randomized sample has been collected and consists of 118 families and their children aged 8-16. At least one parent in the family was treated for an affective disorder. There are four measurements: before the intervention (T1), and at 4 (T2), 10 (T3) and 18 months after the intervention. Preliminary findings concerning the effectiveness of the intervention are reported for the oldest child in the family (N=104) using the Strengths and Difficulties Questionnaire. T-test for dependent samples and repeated-measures ANOVA were used for these comparisons.

Results
Mother-reported total symptoms decreased significantly between T1 and T2 (p=0.04) as well as between T1 and T3 (p=0.01). Moreover, hyperactivity decreased from T2 to T3 (p=0.02), emotional symptoms from T1 to T2 (p<0.01). Peer problems decreased from T1 to T2 (p=0.02) and the increased again between T2 and T3 (p=0.01). Prosocial skills increased between T1 and T2, and between T1 and T3 (p<0.01, p=0.04). The changes in the total, emotional, conduct, peer problems and prosocial skills subscale scores were significantly related to the given intervention (p<0.01; p=0.07; p=0.07; p=0.02; p=0.01), the family intervention being more effective.

Conclusion
Both interventions were effective with family intervention being more effective in preventing children's psychiatric symptoms in families where parents suffer from depression.

OC-02-08

RE-IMAGINING PANIC DISORDER THROUGH A METAPHORICAL VIEWPOINT

INSTITUTIONS
1. Clínica Oficina Kairós, archetypal psychology, São Paulo, Brazil

AUTHORS
1. Ajax Perez Salvador¹, Dr., MD, apersal@uol.com.br

OBJECTIVE: The diagnostic criteria for Panic disorder (PD) are presented in the DSM IV and ICD X as categories of empirical evidence. They configure a syndrome or a behavioral and psychological pattern clinically important in an individual, one associated with suffering, incapacitation and important loss of freedom. The Archetypal Psychology perspective questions the very idea of individual by reviewing psychopathological descriptions from a metaphorical standpoint, considering the importance and limitations of those descriptions, while opening for a more psychological approximation of the concerned issues. The intent is to provide a new approach of the disorder by bringing empirical and metaphorical perspectives together. METHOD: Reading the symptoms listed for PD in the ICD-10, DSM-IV and the Kaplan & Sadock's Comprehensive Textbook of Psychiatry in a metaphorical way makes it possible to connect the empirical in a literal perspective with a form of modern subjectivity understood and presented here as the heroic Ego - and its likeness with the Greek myth of Odysseus and Penelope. The myth of Hermes introduces the metaphorical viewpoint. The relation of these two myths with that of Pan composes the framework that posits the integration of both perspectives.

RESULTS: A parallel is drawn between the reactions of Odysseus/ Penelope upon the vision of Pan and the symptoms of PD, as well as Hermes’ relationship with Pan as a different way of looking at the same things. CONCLUSION: This approach makes it possible to re-imagine PD, valuing its psychological aspects, without abandoning the empirical view or the psychopharmacological treatment.

THE NEW SCIENCE OF POSITIVE EMOTIONS: LESSONS FOR PSYCHOTHERAPY

INSTITUTIONS
1. HARVARD MEDICAL SCHOOL, PSYCHIATRY, BOSTON, MASS, United States

AUTHORS
1. George E. Vaillant, Dr, M.D., gvaillant@partners.org

AIMS: This paper suggests that seven positive emotions: love/attachment, trust/faith, compassion, forgiveness, joy, gratitude, and hope are as important to psychotherapy as they are to religion.

EVIDENCE: The neuroscience of the positive emotions came of age with the fMRI, which permitted them to become tangible. The last three decades of neuroscience reveals a brain that is really two brains: a mammalian brain that can feel, love and trust and empathize via limbic mirror cells and spindle cells in the insula and anterior cingulate and a Homo sapiens neocortical brain that can speak, think and analyze. A leading American textbook CTP-8 devotes 100-600 lines each to shame, guilt, anger, hate and sin, and thousands of lines to depression and fear/anxiety. In contrast it devotes only five lines to hope, one to joy and none to faith, compassion, or love. The so-called negative emotions of anger, sadness, and fear on which psychotherapy focuses are present oriented, predominantly self-oriented, activate the sympathetic nervous system, and elevate cortisol. In contrast, the positive emotions are future oriented, prosocial, activate the parasympathetic nervous system and suppress cortisol. Negative emotions move us toward narcissism; positive emotions lead us away from narcissism.

CONCLUSIONS: Neither Freud nor psychotherapy manuals mention emotions like joy, forgiveness and gratitude. Yet the evidence based efficacy of interventions like positive psychology and Alcoholics Anonymous are based on eliciting these emotions. Our whole concept of psychotherapy might change, if clinicians enhanced positive emotions, as well as focusing upon negative emotions.
OC-03: SCHIZOPHRENIA 2

DISPELLING A MYTH: DEVELOPING WORLD POVERTY, INEQUALITY, VIOLENCE AND SOCIAL FRAGMENTATION ARE NOT GOOD FOR OUTCOME IN SCHIZOPHRENIA INSTITUTIONS
1. University of KwaZulu-Natal, Department of Psychiatry, Nelson R Mandela School of Medicine, Durban, South Africa

AUTHORS
1. Jonathan K Burns1, Dr./ FCpsych(SA) MSc, burns@ukzn.ac.za

The WHO ten-country studies concluded that course and outcome of schizophrenia was better in developing countries. This has become psychiatric lore. However, the reality is that significant political, social and economic ills that characterize many countries in Africa, Latin America and Asia constitute psychosocial stressors that mediate strongly against recovery in individuals living with this disorder. The author reviews outcome studies of schizophrenia in developing countries, and debates concepts of poverty, inequality, violence and social capital in relation to the course of the illness in this context.

The generally poor state of mental health services and policies in these regions are discussed. The belief that community and family life in the developing world is widely intact and that it provides a nurturing environment that facilitates recovery and promotes social and economic empowerment of seriously mentally ill individuals is dispelled as a myth. Idealisation of the under-developed South as a haven for schizophrenia sufferers will only add to the already heavy burden experienced by these individuals, their families and these societies in coping with this disabling disease.

2 YEAR OUTCOME OF FIRST-EpISODE PSYCHOSIS IN SOUTH AFRICA

INSTITUTIONS
1. University of KwaZulu-Natal, Department of Psychiatry, Nelson R Mandela School of Medicine, Durban, South Africa

AUTHORS
1. Jonathan K Burns1, Dr./ FCPsych(SA) MSc, burns@ukzn.ac.za

INTRODUCTION
There is little data on medium term outcome of first-episode psychosis in developing countries. The WHO Ten Country Study findings that outcome of schizophrenia is better in the developing world needs to be tested by current analyses.

METHODOLOGY
90 first-episode psychosis patients admitted to a psychiatric hospital in South Africa were followed up at 2 years with a range of measures to assess clinical and functional outcome. Measures included diagnostic evaluation (SCID), symptom rating (PANSS), quality of life (WHO-QOL) and assessments of social and occupational functioning.

ANALYSIS
A descriptive analysis was performed to evaluate measures of outcome at 2 years. Correlations between diagnosis and outcome as well as between symptoms and outcome were determined using SPSS Version 13.0.

RESULTS
Results of this study will be presented.

DISCUSSION
Medium term outcome of first-episode psychosis is not favourable in the developing world. The long-held belief that psychotic patients fair better in the developing world is challenged and dispelled as a dangerous myth.

4. Yong-Jin Seo2, Dr., MD

Object: Mental health professionals and family association developed PEPS program in European countries for mentally ill people supported by Sanofi-Aventis Pharmaceutical company. The Korean Version was published in 2005 and this study was performed to measure the outcomes of this program.

Method: Totally 691 patients from seventy institutions (41 community mental health centers, 6 social rehabilitation centers, and 23 hospitals) participated in this program. Empowerment Scale, Internalized Stigma of Mental Illness (ISMI) scale, Self-Esteem scale (SES), and Quality of life scale (Happy QoL) were applied to before and after the education. Paired t-test was used to compare the data.

Results: Over 80% were schizophrenic patients. The mean age of them was 36.94(9.35). Over 70% were educated for at least 12 year. Just 10% of them have jobs and their monthly income was US$ 900(93.4). The empowerment scale of the patients was increased after the education (P<.001). Total internalized stigma was reduced after the education (P<.05). Among the ISMI subscales, alienation, negative stereotype and devaluation were improved, but perceived discrimination and stigma resistance were not changed. Self-esteem and quality of life did not show any changes.

Conclusion: PEPS program proved to be a effective psychoeducation program to empower the schizophrenic patients and helpful to overcome the internalized stigma of them.

DETERMINANTS OF QUALITY OF LIFE AMONG FIRST-EPODE SCHIZOPHRENIA PATIENTS IN MALAYSIA

INSTITUTIONS
1. Hospital Mesra, Bukit Padang, Kota Kinabalu, Malaysia

AUTHORS
1. Kok Yoon Chee1, Dr., M.Med (Psych)(UM), cheekokyoon@yahoo.com

Aims: Male gender, unemployment, negative symptoms, depressive syndromes, anxiety symptoms, weight gain, obesity, long duration of untreated psychosis and cognitive impairment (executive function and working memory) have all shown to be predictors for poorer quality of life among patients with schizophrenia. Nevertheless, there has been lacking of data from developing countries. The objective of this study was to determine the predictors of quality of life among compliant patients with first-episode schizophrenia (FES).

Methods: This is an observational, naturalistic cross-sectional study on patients with FES after compliant with treatment for a year. 124 patients were assessed with WHOQOL-BREF in Hospital Kuala Lumpur, Malaysia. The other assessments were socio-clinico-demographic data during diagnosis and after 1 year. ANCOVA was employed to determine the predictors of subjective quality of life taking a number of potential confounders into account simultaneously.

Results: Gender and HoNOS-Impairment score were the only predictive variables for the sub-scale on Physical domain in WHOQOL-BREF. For Psychological domain in WHOQOL-BREF, gender and BPRS-Anergia were the best predictors. Social relationship domain of quality of life was best predicted by HoNOS-Impairment score that emphasized cognitive and physical impairments. Gender and BPRS-Thought Disturbance were the best predictors of quality of life in relation to environment.

Conclusion: Domains of self-rated quality of life in patients with FES in this center are differentially correlated with malleable and non-malleable aspects of socio-demographic and clinical characteristics.

Aim: To study the predictive power and associations of several psychological scales with respect to hospitalisations due to schizophrenic psychoses.

Methods: Temperament and Character Inventory, Physical Anhedonia Scale, Social Anhedonia Scale, Perceptual Aberration Scale, Hypomanic Personality Scale, Bipolar II Scale, and Schizoidia Scale were included in the 31-year follow-up survey of the prospective Northern Finland 1966 Birth Cohort (N=4,926). We compared subjects without any previous hospitalisations to those with previous hospital diagnoses (concurrent validity) and to those who in the eight year long follow-up were hospitalised due to schizophrenic psychosis (predictive validity). We also compared the subjects with schizophrenic psychoses and subjects with other psychiatric disorders (discriminant validity).

Results: In most scales, subjects with schizophrenic psychoses differed from healthy subjects. The Perceptual Aberration Scale was the best scales for concurrent (Effect Size, d = 1.89) and discriminant validity (d = 0.64). Subjects having a high score in Hypomanic Personality Scale were in the highest risk for schizophrenic psychoses in eight-year long follow-up (OR 10.72; 95% CI 2.87-40.06).

Conclusion: Subjects with schizophrenic psychoses differed in most of the scales from healthy controls and from subjects with other psychiatric disorders. Many of the scales were useful predictors for future hospitalisations due to schizophrenic psychoses; the scales were, however, not very diagnosis specific. The predictive power of the scales is limited; these scales as such are probably not useful as screening instruments but can be used in several ways when studying e.g. risk factors or genetics of schizophrenic psychoses.

TWO TYPES OF SCHIZOPHRENIC PATIENTS CLASSIFIED BY WAY OF LIFE

INSTITUTIONS
1. Tokyo Metropolitan Chubu Center for Mental Health, Department of Psychiatric Rehabilitation, Tokyo, Japan

AUTHORS
1. Kazuo Ogawa1, Dr, Kazuo_1_Ogawa@member.metro.tokyo.jp

Objective: The purpose of this study is to investigate the long-term course and outcome of the two types of schizophrenic patients classified by way of life and to examine the validity of this classification.

Methods: The subjects are 48 active type and 29 passive type patients who were discharged from Gunma University Hospital between 1958 and 1962. The investigation of the course and outcome of the subjects was concentrated mainly on the aspect of social adjustment. We assessed the course of social adjustment of each case, month by month, throughout the whole term by using Eguma’s Social Adjustment Scale (ESAS). Based on these data, the comparison between the two types of patients was made with regard to longitudinal course, number of relapses during the entire period and long-term outcome.

Results: The average number of relapses in the Active type patients was 3.1 during the first 5 years and 4.4 during the following period, while in the Passive type patients the number was 1.3 and 1.8 respectively. As to social adjustment course, of the active type patients, 23% were stable self-supportive and 42% were chronic institutionalized among the passive type patients, 55% were stable self-supportive and only 7% were chronic institutionalized.

Conclusions: The long-term course and outcome were more favorable for the Active type than the Passive type patients. The results show that the classification of two types is useful for predicting the long-term course and outcome and for making appropriate interventions.

EFFICACY OF INTEGRATED PSYCHOLOGICAL THERAPY (IPT) FOR SCHIZOPHRENIA PATIENTS: WHAT WORKS?

INSTITUTIONS
1. University Hospital of Psychiatry Bern, Department of Psychotherapy, Bern, Switzerland

AUTHORS
1. Daniel R. Mueller, Dr., PhD, daniel.mueller@spk.unibe.ch
2. Volker Roder, PD Dr., PhD, roder@spk.unibe.ch

Objectives: In recent years studies could demonstrate an association of deficits in neurocognitive domains and functional outcome with social cognition as a mediating factor. The Integrated Psychological Therapy (IPT) for groups was one of the first comprehensive therapy programs to target deficits in all three of these areas. The first IPT subprogram addresses neurocognition, the second one social cognition and the following subprograms social functioning. Up to now, research groups in 11 countries in Europe, Asia, North and South America have conducted 33 evaluation studies on IPT including 1496 schizophrenia patients.

Methods: The aim of this study was to examine which therapy components work best in integrated treatment represented by IPT technology. For that purpose 33 IPT studies were quantitatively reviewed.

Results: IPT demonstrates significant global therapy effects in inpatient and outpatient settings and in academic and non-academic sites compared to control conditions. Two weekly sessions optimise treatment and a longer lasting therapy supports additional benefits in social functioning. The use of only neurocognitive, social cognitive or social functioning subprograms show strong effects in proximal outcome, but only moderate effects in distal outcome. The combination of the neuro- and social cognitive subprograms improves the effects in proximal and distal outcome and leads to a reduction of drop-out rates of 50%. Only the complete implementation of IPT strongly improves the effects at follow-up.

Conclusion: Efficacy of IPT implementing single subprograms is strong with regard to proximal outcome. For generalisation effects a combination of all IPT components seems to be essential.

THE EMPIRICAL STATUS OF PSYCHOLOGICAL THERAPY IN SCHIZOPHRENIA: A SYSTEMATIC REVIEW OF META-ANALYSES

INSTITUTIONS
1. University Psychiatric Services, Department of Psychotherapy, Bern, Switzerland
2. Universidad de Valparaiso, Departamento de Psiquiatria, Escuela de Medicina, Valparaiso, Chile

AUTHORS
1. Mario Pfammatter, Dr., PhD, mario.pfammatter@spk.unibe.ch
2. Ulrich M Junghan, Dr., MD
3. Hans D Brenner, Prof. Dr. Dr., MD, PhD

Objectives: Clinical, ethical and economic considerations have encouraged clinical practice to be guided by an evidence base resulting from evaluations of the efficacy of treatments. Regarding the treatment of schizophrenia guidance now includes several psychological therapy approaches. The present study aims to provide a comprehensive, systematic review of their empirical status.

Method: Evidence from available meta-analyses is systematically reviewed with regard to the comparative and differential efficacy of different psychological therapy approaches. Meta-analyses were identified by Medline and PsycInfo searches. The reported effect sizes were transformed into a uniform effect size measure. A cumulative data synthesis, moderator analyses and homogeneity tests were applied to examine the influence of different study, patient and therapy characteristics on the size, significance and consistency of the effects.

Results: From the 24 meta-analyses identified, social skills training, family interventions, cognitive behaviour therapy, and cognitive re-mediation emerge as effective adjuncts to pharmacotherapy. However, in comparison with unspecific psychosocial interventions the benefits of these psychological therapy approaches are much less distinct. Moreover, the distribution of effect sizes is frequently heterogeneous indicating substantial differences in the effects depending on study, patients and therapy characteristics.

Conclusions: There is now sound evidence for the benefit of psychological therapy in schizophrenia. However, many questions remain: the maintenance of treatment effects, the differential indication, the therapeutic ingredients as well as the synergistic effects still need to be addressed. Another major issue is whether therapies that have been validated in clinical trials can be rolled out into clinical practice.

SCHIZOPHRENIA COURSE: DISEASE „PROFILES“ AND GLOBAL FUNCTIONING EVALUATION

INSTITUTIONS
1. Azienda USL Ferrara, Psychiatry Department, Ferrara, Italy

AUTHORS
1. Maria Cristina Turola¹, Dr, chiartur@gmail.com
2. Elena Bruni¹, Dr, c.bruni@ausl.fe.it
3. Gloria Comellini¹, Dr, g.comellini@ausl.fe.it
4. Luana Peron¹, Dr, l.peron@ausl.fe.it

This research analyzes the disease histories in 1000 consecutive patients affected with schizophrenia syndrome, after their first contact with Psychiatry Department, either Community Care Unit or Psychiatric Unit for acute inpatients. Follow up goes from 3 to 29 years.

Disease „profiles“, developed using data bases and case histories, describe individual paths and trends of disease; they point out age at first contact, follow up years, no. of admissions, no. of community care interventions per year, important life events, therapies carried out, compliance and clinical conditions. Global functioning evaluation at present time is measured using FPS scale (VADO, Morosini and Coll., 1998, 2000). This systematic individual course’s analysis allows to highlight prognosis factors, positive or negative, long-term therapies efficacy, and underline clusters with different courses and outcomes. In our sample, favourable outcomes, with complete remission or feeble residual symptoms and a good global functioning, are beyond 60%, whereas in 10% of cases schizophrenia leads to a very serious disability. The early period of care proves to be a crucial moment for future course and outcome: from first contact it’s very important to work on give complete information to patients and families, obtain reliance and achieve compliance, agree on an individual therapeutic plan, and prevent disability and stigma.

AUTHORS
1. Esra Engin1, Dr, PhD, esraengin@yahoo.co.uk
2. Melek Ardahan2, Dr, PhD, melekardahan@hotmail.com
3. Emel Tekindor Erk3, Mrs.

Objective: The study was conducted in order to analyze the state of recognition of health staff employed at 112 emergency aid stations concerning the symptoms of violence against women.

Method: The sample of the research consisted of 100 health staff who works at 112 emergency aid stations. The data was collected using Introductory Information Form and a scale form measuring the recognition of health staff employed at 112 emergency aid stations concerning the symptoms of violence against women (1, 2).

Results: It was noted that 90.0 % health staff have witnessed violence cases and 87.0 % have not received an in-service training for acquiring recognition of the physical and psychological symptoms of violence executed against women. The average score the health staff received from the scale measuring the recognition of health staff concerning the symptoms of violence against women was 21.50 ±4.25. It was seen that 10 % of staff was sufficient, 75.0 % was partially sufficient and 15.0 % was insufficient concerning their recognition of the symptoms of violence against women.

Conclusion: It was concluded that health staff was insufficient in recognizing the symptoms of violence against women. It can be proposed that in-service training programs would be designed on violence against women.

PROJECT RECOVER: A PROGRAM FOR DISASTER RESPONSE MENTAL HEALTH RECOVERY USED AFTER HURRICANE KATRINA USA 2005

INSTITUTIONS
1. The InnerLink, Education, Lancaster PA, United States

AUTHORS
1. Robert G. Gillio1, MD, rgilio@theinnerlink.com
2. Beth R. Gillio2, Mrs., R.D., bgilio@theinnerlink.com

In the aftermath of Hurricane Katrina along the Gulf Coast of the United States in 2005 there was a great deal of emotional trauma associated with the massive upheaval in families and disruption of society infrastructure. A program called Project Recover was utilized in a series of schools in Mississippi and Louisiana, including New Orleans in the 3 years after the disaster. Project Recover was developed by a team of medical, psychological and technical experts. It is in English and is aligned to standards for education in the United States. It has been designed for the middle school level and is accessed with a computer connected to the Internet. Use of the program takes about 5 hours total time and can be done in one day or over several sessions. It has primarily been in school but also in an after school setting. Some psychologists have used in conjunction with clinical therapy sessions. This is an online program that guides students through the knowledge, skills, and resources necessary to help them identify there issues, and make a plan for how to deal with them. The program utilizes many techniques such as games, flash animation, and video to supplement its written content. Participants will receive a license to the program and be able to understand the learning and treatment objectives of the program, how this program is implemented, how to use pre and post testing, and understand the research documenting its usefulness.

3. Sarath Amarasinghe³, Dr., PhD, sarath@soci.ruh.ac.lk

OBJECTIVES:
On 26 December 2004, a large earthquake occurred off the west coast of Sumatra and devastating tsunami struck surrounding countries. Sri Lanka was the second most seriously affected country after Indonesia, with more than 31,000 deaths and 4,000 people missing. The purpose of the study is to elucidate the relationship between factors of tsunami-related exposure and psychological effects among the residents in southern Sri Lanka.

METHODS: A survey of personal interview by using questionnaire is conducted on the subjects who were living in the differentially affected areas (i.e. severely, moderately and little affected area) of southern Sri Lanka at the time of tsunami attack. The questionnaire includes information about demographic (age, sex and marital status), socio-economic (occupation, education and religion) and lifestyle (smoking and drinking habit) factors and somatic health condition (activities of daily living, presence of chronic diseases and self-rated health status). Detailed questions about objective and subjective features of tsunami-related exposure (death of family member, suffering serious injury, damage of house, forced relocation and thoughts of fear) are also included. Posttraumatic stress disorder and depressive symptoms are assessed by Impact of Event Scale-Revised (IES-R) and Center for Epidemiologic Studies Depression Scale (CES-D), respectively. General Health Questionnaire 12-item version (GHQ-12) is also used to assess general mental health status.

RESULTS: The survey is being carried out. The results will be presented at the meeting.

Aims: Bangladesh is a disaster prone country. Geographical location, poor telecommunication facilities, lack of shelter, poor economical status have made our people at high risk of disasters. A devastating cyclone named Sidr hit the southern and middle districts of Bangladesh with 215 to 250 km per hour speed at the highest on 15th November 2007. The damage was extensive, including tin shacks flattened, houses and schools blown away and enormous tree damage. Some local officials have described the damage as being even worse than that from the 1991 cyclone. The entire cities of Patuakhali, Barguna and Jhalokati District were hit hard by the storm surge of over 5 meters (16 ft).

This study was done among the Sidr affected areas of the southern districts of Bangladesh to see the extent of psychiatric morbidity among them.

Methods: A total of five teams worked in three districts. A 24-item Self Reporting Questionnaire was applied to 326 people over 18 years of age.

Results: The results showed a high prevalence (76 - 99%) of psychiatric morbidity among those people. Correlates of vulnerability factors were also evaluated. Death of relatives; loss of property, social status, household etc. were related with high prevalence of psychiatric morbidity.

Conclusion: All these information necessitates the institution of a Disaster Mental Health Program in those areas.

SEXUAL DYSFUNCTIONS IN PATIENTS WITH TEMPORAL EPILEPSY

INSTITUTIONS
1. Moscow research institute of psychiatry, sexology, Moscow, Russian Federation

AUTHORS
1. Anna Kalinina1, kalinina_ane@mail.ru
2. Nikolai Kibrik1, Dr, MD, prof

Objective: the current study was carried out in order to find any possible relationships between seizure semiology, their frequency, antiepileptic drugs treatment and affective disorders and sexual disorders in epileptic patients.

Design and methods: Two groups of epileptic patients with (100 persons) and without (50) sexual disorders were compared in study. Munich Personality Test (MPT; SCL-90; Hamilton Depression Scale and National Hospital Scale for Severity of Seizures (NHS3) were used in study.

Results: Obtained results have shown that libido reduction was the most frequent complaint in epileptic patients and it has occurred in 75% of patients. Patients with sexual dysfunctions were mostly characterized by temporal lobe epilepsy, concomitant depressive disorder, frequent complex partial seizures and long duration of epilepsy compared with epileptic patients without sexual disorders.

Conclusion: Sexual dysfunctions in patients with epilepsy seem to have interrelationship with temporal epilepsy with co-morbid depression and represents one facet of Geschwind-Gastaut triade. Suggestion can be made that mesial temporal epilepsy is risk factor for possible sexual dysfunctions development.

VIOLENT INJURIES AND RELATIONSHIP TO ALCOHOL USE

INSTITUTIONS
1. Tzu-Chi Buddhist General hospital, Tzu Chi University, family Medicine, Hualien city, Taiwan Republic of China

AUTHORS
1. Yin-Ming Li1, Dr. MD, yinming@mail.tcu.edu.tw

Aims: Injuries are major causes of mortality and morbidity in Taiwan. Alcohol involvement often plays a role in injuries. The purpose of this study was to determine the prevalence of alcohol-related violent injuries and their epidemiologic characteristics at an emergency department.

Methods: Patients, aged at 13-80 years, who were injured due to self-deliberate or interpersonal violence, were studied. For each patient, the attending nurse completed an injury-coding sheet which included the results of an assessment of whether the patient had an alcohol odor or alcohol consumption related behavior. Blood alcohol testing was also performed based on the decision of the attending physician. Injuries were defined as alcohol-related based on the report of 'alcohol odor' or 'intoxicated' by the nurse or a positive blood alcohol test. Epidemiologic characteristics of violent injury were analyzed.

Results: A total of 561 violent injuries were studied and 43.4% were classified as alcohol-related. The prevalence of alcohol-related violent injuries was 50.2% for males and 34.9% for females. More than half (53.7%) was noted among aged 25 to 45 years. Alcohol use also noted among adolescents (age 13-17, 8.9%). Alcohol use was common among self-deliberate injury (47.6%) and interpersonal injuries (42.9%). The top two occurrences of violent injuries were home (34.6%) and recreational location (29.4%). Of those identified with alcohol use, 17.5% of them were admitted for further treatment.

Conclusions: Nearly half violent injuries were related to alcohol use. Particular attention needs to be given to preventing and reducing the burden of alcohol-related homicide and violence.

WORKING; COPING; EATING AND CORTISOL RESPONSES IN DIFFERENT TYPES OF IMPULSIVITY

INSTITUTIONS
1. University of Giessen, Psychology, Giessen, Germany

AUTHORS
1. Petra S. Netter1, Prof. MD, PhD, petra.netter@psychol.uni-giessen.de
2. Ronja Hueppe1, cand. psych.
4. Anneke Meyer-Berg1, Dipl.Soz

Objectives: Hyperactivity and attention deficit subtypes of impulsivity have been defined for ADHD and differ in several behavioural and physiological variables. Since Motor and Nonplanning Impulsivity as defined by Barratt’s questionnaire may be taken to represent the two clinical groups in healthy populations, the aim of this experiment was to compare high and low scorers on these dimension with respect to their working style, coping strategies, eating habits and cortisol responses.

Methods: In experiment I 70 medical students provided saliva samples for measuring cortisol awakening responses (CAR) and samples before and after a written exam, filled in questionnaires on impulsivity, working strategies during the exam, and coping styles. In experiment II Impulsivity was investigated with respect to eating habits and food intake in 57 students.

Results: High and low Motor Impulsives differed in working strategies and coping styles resembling the deficits of the hyperactivity type of ADHD whereas high Nonplanning Impulsives differed in aspects characteristic for attention deficit. Motor Impulsivity also moderated the relationship between cortisol and working style: CAR and stress responses indicated successful ways of working in low impulsives but an ineffective way in highs. The most striking result of study II was that high Motor Impulsives tended to eat more unhealthy food while believing in health food while lows acted according to their attitudes, a finding not observed for differences in Nonplanning Impulsivity

Conclusions: Questionnaire dimension in healthy persons reflect those in psychopathology and impulsivity may moderate relationships between endocrine responses or attitudes and behaviour.

MENTAL HEALTH IN WARTIME: A SURVEY OF DISPLACED POPULATIONS AMIDST JULY 2006 WAR IN LEBANON

INSTITUTIONS
1. American University of Beirut, Epidemiology and Population Health, Beirut, Lebanon

AUTHORS
1. Monique Chaaya¹, DrPH, mchaaya@aub.edu.lb
2. Rouham Yamout¹, MD/MPH, rsy02@aub.edu.lb
3. Nabil Tabbal¹, Mr/MPH, nt15@aub.edu.lb

Objectives This study reports on prevalence and determinants of anxiety in civilians at an early stage of displacement, and investigates the relationship between anxiety, displacement and war experiences in specific cultural and political contexts.

Methods A Cross sectional study of 218 internally displaced adults settled in 4 centers in Beirut was done during the July 2006 war in Lebanon. Anxiety was assessed using an Arabic translated version of the Hamilton Anxiety Rate Scale (HAM-A). Participants were categorized as having no or low level of anxiety, moderate level of anxiety and severe level of anxiety. Data were collected using a structured interview.

Results The prevalence of severe level of anxiety (13.3%) was relatively low in a population having undergone major stressful events. Logistic regression, done only for females due to a small count of males presenting the outcome of interest, revealed that anxiety was significantly associated with sharing rooms at IDP centers, where females sharing with family members being more prone to anxiety as compared to those sharing with strangers (AOR = 3.41).

Conclusions During the July 2006 war, a general picture of resilience was displayed by those displaced to institutional centers monitored by representatives of their community leadership. The importance of social environment contributing to the psychological well being of females was highlighted. The authors also discussed the importance of common ideological commitment of the displaced, their high communicative nature and their trust in their political leadership in buffering the impact of individual experiences of war trauma and displacement.

PROLONGED TERROR AND EXTERMINATION, HOW DOES DARFURIANS MENTALLY SURVIVE? IMPRESSIONS FROM THE INSIDE

INSTITUTIONS
1. Ain Shams University, Psychiatry, Cairo, Egypt

AUTHORS
1. Mohamed M Mandour¹, Dr., MD, mandour@un.org

The atrocities inflicted on the Darfurians are extreme and includes burning villages, harassment, killing and rape. According to statistics 3 million Darfurians (1 of 3) have been forcibly displaced. 200 000 have died because of unmet health or physiological needs -lack of basic necessities as food and water. No-one knows how many have been killed.

Darfurians experience constant fear and lack of trust when they are at large. The situation of the forcibly displaced (IDPs) is much worse. They are any time vulnerable to arrests and maltreatment in addition to harassment and thefts by armed Janjaweed tribes and others.

The first issues the Darfurians focus on in order to cope and maintain their mental stability are housing and the basic activities of daily life. They establish markets and start to practice religious customs. Weddings, parties, music, singing - sometimes sadly - indulging in sop-phist activities - all supports and strengthens the coping capacities. Women entertain their families, good hearted, with smiles - though always apprehensive and vigilant (a high paranoid axis). They produce and use “forbidden drinks” as self-medication.

The antagonism between the common terror and the family life requires the ability to endure a reactive paranoid reaction to threat and persecution. The coping capacity of the Darfurians is amazing, particularly the womens, who use their maximum surviving ability and over consume their endogenous endorphins.

The author is a psychiatrist who has worked for many years in Darfur. He will show pictures of how the families maintain their mental health.

PTSD: FROM THEORY TO PRACTICE (IN CONNECTION WITH AN ALGERIAN EXPERIENCE)

INSTITUTIONS
1. EHS Drid Hocine, Alger, Algeria

AUTHORS
1. Hakima Souki¹, Mrs, PhD, souhihakima@yahoo.fr

For more than a decade, the Algerian „shrink” has been confronted to post traumatic syndrome disorders. In view of the scope of the events, he had to intervene quite urgently, on the one hand, and ponder rather quickly over his approach and intervention on the other hand. Confronted with the multitude of theoretical, nosographic, etiopathological and therapeutic models, as well as with various school squabbles, he was compelled to make his own choices, not arbitrarily of course, but choices that were imposed by the needs of the field, urged by the Algerian setting and context. This tough and painful experience, but nonetheless enriching and enlightening, has helped the Algerian „shrink” find his own niche in the realm of the reflection on PTSD.

Key words: violence- terrorism- victim- intervention

SYSTEMIC INTERVENTION IN AN EMERGENCY CONTEXT: THE ALGERIAN EXPERIENCE

INSTITUTIONS
1. EHS M.Boucebci, Cheraga, Algeria

AUTHORS
1. Karima Ammar-Fernani¹, MD, PhD, ahmed_bennegueouch@hotmail.fr

Our purpose would be a re-reading of the care and assistance professional’s interventions during the last ten years with violence and disasters in Algeria (1992 - 2003). From about several typical and clinical cases we will show how we had to translate some classical guidelines in another specific one, as systemic intervention in extreme situations of disaster, to help people in distress and their professionals of care.

Key-words: emergency context, victim, systemic intervention
Evident gaps exist between theoretical management of psychotraumatic symptoms and psychologically injured patients in our everyday clinical practice. Sticking to guidelines based on the DSM-IV classification is essential. But we must also consider the patient’s clinical evolution, which needs theory adjustments and tailored treatments. Several clinical trends have already tried to steal the “gold standard” seat. Some have reached an interesting notoriety, others have been rejected from a decent clinical practice. Many others are playing the outsider role. These debates about different treatment cultures need some concise description and critical spotlight that we are going to provide.

The present study aimed at characterizing pathological travellers, a population seldom studied in psychiatry, who come in Geneva in reaction to persecutory delusions to ask for help, often as a last recourse. It is important to distinguish people seeking help for human right abuses from pathological travellers, since responses to their suffering should of course be different. Key-words: persecutory delusions, human rights, travellers, international, Geneva

**THE RECOVERY PROCESS OF PERSONS WITH PSYCHIATRIC DISABILITIES: VALUES AND PRINCIPLES OF INTEGRATED PERSONAL DEVELOPMENT MODEL (IPDM)**

**INSTITUTIONS**
1. Oporto Polytechnic Institute, School of Allied Health Sciences, Porto, Portugal
2. University of Porto: Faculty of Psychology and Education Sciences, Porto, Portugal

**AUTHORS**
1. Antonio Marques\(^1,2\), PhD, ajmarques@estsp.ipp.pt
2. Cristina Queiros\(^2\), PhD
3. Nuno Rocha\(^1,2\)

**Aims:** The Integrated Personal Development Model (IPDM) was raised based on some nuclear assumptions as suppressing the stigma always associated with the disease, defocusing from the mental health role, promoting empowerment and self-determination, as well as developing personal competencies directly related to the individuals social integration specific context. The aim of this communication is to present the rational of this model and the outcomes of a pilot study designed to test it.

**Methods:** This psychosocial rehabilitation program (9 months/3 hours-day) was developed in a non segregated organisation and it integrated people with and without psychiatric disease. The intervention was based in training and virtual reality methods, applying diverse instruments such as ‘Cognitive Rehabilitation Integrated Virtual’ or ‘Readiness, Choosing and Achieving Valued Roles - Practitioner Tools’. Assessment integrated pre and post tests, evaluating different functional domains: cognitive, emotional, social behaviour, self-efficacy, employability competencies, life quality and program satisfaction.

**Results:** Results point towards very positive outcomes, since there were identified significant differences between both groups in pre and post test regarding cognitive and emotional performance, employability competencies, subjective perspective on life quality and self-efficacy. Moreover, the frequency and satisfaction level with the program were notably high, all the persons completed the Portuguese minimum qualification required level, and some were professionally integrated.

**Conclusions:** Although these initial results are promising concerning promotion of functional competencies, social integration and quality of life in people with psychiatric disabilities, the current research is an initial step in establishing the efficacy of this new rehabilitation model.

**OC-06-02**

**MENTALLY ILL OFFENDERS: QUALITY OF LIFE AND LEVEL OF PSYCHOLOGICAL WELL-BEING.**

**INSTITUTIONS**
1. The Serbsky National Research Centre for Social and Forensic Psychiatry, Department of prevention of socially dangerous acts of the mentally ill, Moscow, Russian Federation

**AUTHORS**
1. Alla Abdrazykova\(^1\), Mrs, MD, aballa@mail.ru
2. Vera Bulygina\(^1\), Mrs, PhD, ver210@yandex.ru

**Aims and Methods:** The goal of this study was to examine the relationship between quality of life and level of psychological well-being during coercive treatment on the sample of schizophrenic patients. 88 patients with schizophrenia disorders during initial and expiry period of compulsory treatment were interviewed with inventory of quality of life (A. Shmukler), scales of psychological well-being (C. Ryff) and scales of self-esteem (mod. Dembo-Rubinstein).

**Results:** The elder patients demonstrated a highest level of such scales as “Positive Relations with Others” and “Purpose in Life”. All the patients had a low level of “Autonomy” without dependence of their age, social status and the forensic history. Moreover, their self-esteem and self-concept did not mediate the process of construction and reconstruction of subjective appraisals and psychological well-being. The presence of the hallucinations, paranoid symptoms, affective disorders and the presence of the motivation on adaptation influence on satisfaction of the quality of life and social functioning of patients. And at the same time constant and high level of motivation on re-socialization causes low level of self esteem and psychological well-being among these persons, especially before discharging from the hospital.

**Conclusions:** Characteristics of self-esteem and some parameters of psychological well-being can be considered as the targets of psychotherapeutic interventions during coercive treatment. Scales of psychological well-being are an adequate additional instrument for the evaluating the efficacy of psychosocial rehabilitation.

**COUNSELLING FAMILIES OF ALCOHOLICS (SIGNIFICANT OTHERS)**

**INSTITUTIONS**
1. Institute for mental health, Belgrade, Serbia and Montenegro

**AUTHORS**
1. Danica Boakovic-Djukic
2. Vera Trbic

Alcoholism is a very serious public health problem which is hidden most of the time. Through several decades of work with alcoholics and their families, it seems that we step away from ordinary world and overlook or forget that not everyone think that alcoholism is a family problem. Our working program, based on an ecosystemic approach involve so called "significant others" (network therapy) in treatment of alcoholism, and this approach helps more because we work with family members as part of consultancy before alcoholic stops drinking. Working difficulties which are part of transition changes in 21st century reflect on quantity and quality of counselling work, and this brings less number of family involved in this kind of professional treatment. It is well known that abusers motivation for treatment is minimal, family support is necessary as well as support of significant others. Therefore our experience has been aimed on free services (without any records) as a way to gain and motivate the families to look for help. This text will present data on project "Alcoholic prevention through the counselling" financed by Belgrade Parliament, which main idea was to give professional help to citizens by re-organizing counselling unit. Final purpose is implementation of these services on the local level of the community with slogan "closer and faster to the healthy family". It is necessary to state that we don't cure alcoholism, neither give diagnose, because this procedure is done in institutes specialized on alcoholic treatment.

**Key words:** alcoholism, significant others, family, counselling

**AN INFANTICIDE: ACTING OR PREMEDITATION?**

**INSTITUTIONS**
1. University of Padua, Department of Neuroscience, Padua, Italy
2. Private practice, Padua, Italy

**AUTHORS**
1. Arianna Di Florio, Dr, MD, ariannadf@inwind.it
2. Anna Palleschi, Dr, MD
3. Claudio de Bertolini, Prof., MD

Aim: To present a case of infanticide that is hard to comprehend and to discuss the principle difficulties. The case deals with the charge of infanticide brought against Mara, age 40, married with four children. The statement arose from the finding of a plastic sack containing the clothing and the body of a newborn without apparent signs of external injury. The statement continues that some days earlier during the night the accused had requested help from people who lived close to the place where she had had a road accident. The neighbours remembered that the woman appeared very agitated and was unable to explain what had happened. Despite being in midwinter the accused was dressed in a sweater with half-length sleeves and in shoes but without stockings. She remembered nothing of the birth and only confusedly what happened there after.

Method: We are not able to refer to any standard proof of insanity. We have instead to follow the hermeneutic analysis, characterised by a specific, methodological sequence of steps, unique to this particular plea of insanity.

Discussion: The prosecution maintains that Mara deliberately killed her daughter after the birth to hide the facts. The defence maintains that the pre-existing psychological condition, the disequilibrium engendered by the birth induced a crepuscular state, taking her back to a primitive condition.

Conclusion: This case demonstrates how the most sophisticated epistemological methodology has become an integral part of clinical practice.

DETECTION OF RISK FACTORS IN THE SUICIDE IDEA DURING ADOLESCENCE

INSTITUTIONS
1. Universidad Kennedy, Psicología Clínica, Buenos Aires, Argentina

AUTHORS
1. Héctor R. Fischer, Dr, dep19@kennedy.edu.ar
2. Norberto I.J. Pisoni, Dr, dep19@kennedy.edu.ar
3. Mariana Czapski, Dr, dep19@kennedy.edu.ar

Suicide is one of the main causes of adolescent death all around the world. In the last few years, a deeper knowledge of different risk factors related to it, generated the need for a predictive model that discriminates the differential importance of these factors in each context. The purpose of this investigation is to detect the group of factors that are more related to the suicide idea in teenagers, regarded that this idea is directly linked to the attempt of suicide. The root of this investigation lies in the hypothesis of the suicide idea in teenagers is associated to a combination of both individual and social factors, building a predictive model of risk. To detect them, a psycho-measuring technique will be tested in teenager samples in Buenos Aires (800 men and women, between the ages of 12 and 20 years old) in twin stages: 1- Tracking from a universe of items extracted from different evaluation tests and classified by expert judges. 2- Instrument testing, resulting of a posterior elimination of the items without significant correlation.

THE RELATIONSHIP BETWEEN PERSONAL KNOWLEDGE, SOCIAL SUPPORT SYSTEMS, MENOPAUSAL SYMPTOMS, SELF-CARE, DEPRESSIVE SYMPTOMS, STRESS, AND HEALTH STATUS AMONG SOUTHERN RURAL AFRICAN AMERICAN MENOPAUSAL WOMEN

INSTITUTIONS
1. Case Western Reserve University, Frances Payne Bolton School of Nursing, Cleveland, United States
2. Wayne State University, Center for Health Research, Detroit, United States
3. Case Western Reserve University, Frances Payne Bolton School of Nursing, Cleveland, United States

AUTHORS
1. Faye A Gary, Dr., PhD, fgary@case.edu
2. Hossein N. Yarandi, Dr., PhD, Yarandi@wayne.edu
3. May Wykle, Dr., PhD, may.wykle@case.edu

Aims: Menopause affects millions of women worldwide. This presentation will explore the relationships between: (1) knowledge about the perimenopausal or menopausal health, (2) support systems, (3) symptom management, (4) self-care approaches used among the women, (5) depressive symptoms and stress, (6) hassles in their lives, and (7) their overall health status.

Methods: This descriptive correlational study is based on data that were obtained from 206 southern rural African American women, between 40 and 60 years of age. The women were invited to participate in a face-to-face interview. An alpha of 0.05, beta of 0.15, effect size of 0.30, and power of 0.85 were used in this study. Instruments that were used in collecting data were the Menopausal Health Survey, People In Your Life Questionnaire, Life Stress Questionnaire, and the Beck Depression Inventory. Specifically, descriptive statistics, chi-square, correlation analyses, and multiple regression were used to analyze the data.

Results: The study results indicated that the women who reported fair or poor health were less likely to have health insurance, to be employed, to have a support system, and to be engaged in meaningful relationships.

Conclusion: African American women are a vulnerable population that need to have culture-specific interventions that address their health and social needs. The health disparities that exist among the population could be related to knowledge deficits about their health and how to best engage in health-seeking behaviors.

**DEPRESSIVE SYMPTOMS AND SELF-PERCEIVED BURDEN IN PRIMARY CAREGIVERS OF THE DISABLED ELDERLY AT HOME**

**INSTITUTIONS**
1. Nagasaki University Graduate School of Biomedical Sciences, Department of Public Health, 1-12-4 Sakamoto, Nagasaki, Japan
2. Nagasaki University, Research Center for Tropical Infectious Diseases, Institute of Tropical Medicine, 1-12-4 Sakamoto, Nagasaki, Japan

**AUTHORS**
1. Ayumi Ichiryu, Ms., MS, ayumi-ichiryu@hotmail.co.jp
2. Sumihisa Honda, Dr., PhD, honda@nagasaki-u.ac.jp

**OBJECTIVES:** The purpose of the study was to elucidate the mental health conditions and self-perceived burden in family caregivers of the disabled elderly.

**METHODS:** A total of 101 subjects (21 men and 80 women) who were primary caregivers of the disabled elderly at home were included in the study. We assessed their mental health conditions by using 12-item version of the General Health Questionnaire (GHQ-12) and the Center for Epidemiologic Studies Depression Scale (CES-D). A high GHQ-12 score was defined when the score exceeded the threshold value of 3, while a high CES-D score was defined when the score exceeded the threshold value of 15. Information about demographic factors of caregivers and self-perceived burden were interviewed by using a questionnaire.

**RESULTS:** The mean age of the subjects was 63.5 years, ranging from 38 to 87 years. The relationship to the disabled elderly was 28 daughters, 26 daughters-in-law, 23 wives, 14 sons and 10 others. The median duration of caregiving was 3 years. Eleven subjects rated their health as bad, 28 subjects as fairly bad, 51 subjects as medium and 11 subjects rated as good. Among the subjects, 77 (76%) caregivers had self-perceived burden in caregiving. A high GHQ-12 score was observed in 23 (23%) subjects, and a high CES-D score was observed in 28 (28%) subjects. Self-perceived burden of family caregivers were significantly associated with high GHQ-12 score (p<0.001) and high CES-D score (p<0.001).

**CONCLUSION:** It was indicated that mental health support for the self-perceived burden of family caregivers is important.

**MUSLIM SUICIDE - KASHMIR EXPERIENCE**

**INSTITUTIONS**
1. Department psychiatry GMC Srinagar, India

**AUTHORS**
1. Arshad Hussain
2. Zaid Wani
3. Huda Mushtaq

**Background:** Kashmir, a predominantly Muslim society had lowest rates of suicide in whole India(0.5/100,000) but not any more. 17yrs of conflict has brought trauma and turmoil. PTSD, MDD, SUBSTANCE USE are at all time high. Suicide is becoming the second cause of unnatural death.

**Methods:** This study was based on data from, longitudinal medico legal registers of S.M.H.S Hospital of GMC Srinagar. The registers were surveyed for all suicide, Para suicide and deliberate self harm cases. Medical record number - a unique registration number - was used for identification of case files of suicide behaviour, which were then used to reflect on various socio - demographic variables and psychiatric assessments.

**Results:** The result of the study reveals that on average 3.5 persons report / day to SMHS casuality with suicidal behavior. Most of the people who complete suicide are males of the age group 25 - 34. Most of the attempts are made by female - 4 times Para suicides and 7 times more DSH. Violent methods of suicide like cut throat and burns are a new phenomenon. All types of suicidal behavior are common in age group 25 - 34 except DSH in females were 63 % are in age group 19 - 24yrs

**CONCLUSION:** Suicide as health problem has announced its arrival in an unlikely socioreligious scenario and perhaps taking all health planners unawares. And preventive strategies at all levels from primordial to primary to secondary to tertiary need to be taken to address this problem.
Factors Influencing the Quality of Life of Relatives of Persons Suffering from Schizophrenia

Objective: Caring for a relative suffering from a serious mental disorder is a chronic, stressful process that considerably influences caregivers’ lives. Assessments of health-related personal experiences confirmed the deterioration of their quality of life. The aim of this research was to establish the factors that influence the quality of life of relatives of persons suffering from schizophrenia.

Method: The study included a total sample of 100 family members, relatives of 60 patients diagnosed for schizophrenia, who are over 18 years old and live in the same household with the patient. Socio-demographic data about the subjects, patients, their cousinship, the time they spent together, as well as the characteristics of their illness were collected. Medical Outcomes Study 36-item Short-Form Health Survey was used as the quality of life instrument.

Results: The subject's age, marital status, existence of cardiovascular disease, cousinship and the time spent with the ill relative were significantly connected with the quality of life of patients' family members. Religiousness was inversely related with the caregivers' quality of life. The level of education is the only important variable among patient's characteristics. Duration of illness, symptoms' intensity and the global level of functioning were very important factors too.

Conclusion: Identification of influencing factors is the first step in the improvement of the quality of life of family members of persons suffering from schizophrenia. Although some of them can not be changed, there are still those that require constant attention of both: formal, professional caregivers as well as of informal, family caregivers.

AUTHORS
1. Carmine Brocco¹, Dr, MD, C_psy2000@yahoo.fr
2. Patrick Alvin², Dr, MD
3. Catherine Graindorge³, Mrs, PhD
4. Mario Speranza⁴, DR, PhD

Aim: To study the coping skills in suicide attempted adolescents and the impact of psychopathological suicidal risk factors, as the depressive level, anxious trait, hopelessness and self-esteem, on these coping skills.

Methods: Fifteen adolescents hospitalized owing to suicide attempt were compared with 12 healthy adolescents by the Coping Inventory Stress Situation (Ciss) and the Adolescent Coping Scale (ACS). Psychopathological risk factors were evaluated by the Beck Depression Inventory (BDI), the Beck Hopelessness Scale (BHS), the State-Trait Anxiety Inventory (STAI) and the Self-Esteem Scale (SES).

Results: Two groups are comparable according to socio-demographical characteristics. Suicide attempted adolescents show significantly higher scores at the subscales "Emotion" of Ciss and the "Non-Productive Style" of ACS, and a significantly lower score to the subscale "Productive Style" of ACS. Besides, they are more depressive and more anxious, and they present a lower self-esteem and a higher hopelessness degree than the control subjects. In Multiple Regression Analysis, the increase in scores of both "Emotion" and "Non-Productive Style" is correlated to the depressive level and to anxious personality; instead, the decrease in scores of the "Productive Style" is associated with low self-esteem, hopelessness and anxious personality. Age and sex variables have no impact on the differences in coping skills between both groups.

Conclusions: Suicide attempted adolescents use emotional and non-productive coping skills, in association with the depressive degree and anxious personality; hopelessness and low self-esteem decrease the use of productive coping strategies.

Keywords: Suicide Attempt, Coping, Depression, Anxiety, Hopelessness, Self-Esteem, Adolescents

SUICIDAL BEHAVIOUR FOR SEXUAL REASONS

INSTITUTIONS
1. Moscow Scientific Research Institute of Psychiatry, Russian Federation

AUTHORS
1. Tatiana Butkova¹
2. Nikolai kibrik¹, Dr, Md, Prof

Objective: According to the data of our research most of the suicides are committed for sexual (6%), intimate-personal (15%) and family (52%) reasons.

Methods: Among the patients who asked for sexological help, persons at the age from 18 up to 50 years old, prevailed. Among them there were 57% of men and 43% of women. In the work clinical, clinico-psychopathological, sexological testing

Results: Suicidal behaviour manifested in suicidal intentions, attempts and thoughts. Those patients who were susceptible to demonstrative-blackmail kinds of suicide (62%) on the strength of their personal peculiarities, psychopathology manifestations, peculiarities of their constitution and with situational circumstances, rarely turn for sexological help with violations in the intimate area. By their behaviour they prefer provoking feelings of guilty and compassion for their partner’s part. For the patients who had real suicidal attempts (38%), concealment of the information about the given incident, is strong-willed and typical. They sense feeling of groundlessness, manifestation of feebleness, shame because of their suicidal behaviour in the past. And a brought down self-appraisal of the person, that is found in 72% of the cases, assist of forming ideas of their own little-value, superfluousness, loneliness.

Conclusions: The elaboration of adequate measures for prevention, early revelation and timely treatment of the patients who had suicide attempts in consequence of sexual confusions downs, assists to increase of effectiveness in the actions of medical-psychological and social rehabilitation of patients.

PECULIARITIES OF SUICIDAL BEHAVIOR OF MINSK RESIDENTS

INSTITUTIONS
1. Minsk Psychoneurological Hospital, Mental health Center, Minsk, Belarus
2. Minsk State Medical University, Legal Medicine Department, Minsk, Belarus

AUTHORS
1. Siarhei V. Davidouski, Dr., PhD, davidouski@yandex.ru
2. Siarhey A. Ihumnau, Dr., PhD, sergey_igumnov@tut.by

Over one million people commit suicide annually, which causes considerable economic damage to the society. To prevent suicide in Minsk a suicidal activity monitoring was conducted during two years; it included registration of all cases of suicide and parasuicide. It was revealed that among parasuicides prevailed women (53% in 2006, 58.4% in 2005), aged 20-39 (64.6% in 2006, 63% in 2005); main type of suicide is medicines poisoning (30% of all suicides in 2006, 33.8% in 2005). For those cases, low quality of asking for psychotherapeutic help was characteristic (only about 2% of all those who asked for help). Only every fifth of those who had committed parasuicide, committed suicide later.

Among suicide, men aged 40-59 prevailed. The main method (85% of all cases) was hanging. Among men, 62.3% had certain blood alcohol concentration (in most cases, from 1.5 to 2.5%). Seventy nine individuals or 16.6% of all suicides, were registered at the narcologist. One hundred and five or 22% of all suicides were psychiatrists’ cases. The monitoring allowed to develop a strategy for prevention of suicidal behavior among men of 40 to 59 years old with alcoholic intoxication, but, not alcohol addicts. It was marked that members of this risk group do not ask for psychotherapeutic help (it is mainly women aged 35-45, who apply: 85% of all who asked for help). This work allowed to decrease the number of suicides from 19.7 cases per 100,000 in 2003 to 11.5 -11, cases per 100,000 in 2006.

STUDY OF PREVALENCE OF SUICIDAL IDEATION AND ITS SOCIO-DEMOGRAPHIC CO-RELATES IN AN URBAN COMMUNITY IN NORTH INDIA

INSTITUTIONS
1. Institute of Human Behavior and Allied Sciences (IHBAS), Psychiatry, Delhi, India

AUTHORS
1. Nimesh G Desai, Dr., MD,MPH,MRCPsych, ngd2000@hotmail.com
2. Somnath Sengupta, Dr., MD, sn_sengupta@hotmail.com
3. Chandra Bhushan Tripathi, Dr., PhD, cbt_vns@hotmail.com
4. Sudeep Kumar, Dr., PhD
5. Sashi Bhushan Singh, Dr., PhD

Objective: To study the nature and prevalence of suicidal ideation in the community population of Delhi.

Methodology: The study was conducted on a gender equated sample of 1100 respondents belonging to different socio economic strata. The number of colonies was selected using Probability Proportional to Size technique and the colonies were selected by draw of lots. The screening of suicidal ideation was done by using GHQ -12 and Suicide Related Behaviour tool. Those respondents whose SRB response was positive or those who had both GHQ & SRB score positive were recognized as the ideators.

Analysis: Data entry and analysis was done using SPSS statistical software and non parametric tests (chi square).

Results: The prevalence of suicidal ideation in our study was 11.1 % (95% CI 11.04%-11.16%) has suicidal ideation in the total sample. The prevalence of suicidal ideation beyond last six months was 2.55 % (95% CI 1.90%-3.25%), within two to six months was 5.18 % (95% CI 4.82%-5.40%) and the last one month was 3.36 % (95% CI 3.33%-3.39%). Further, 63.1 % (95% CI 62.31%-63.89%) of the ideators had common mental disorders. Suicidal ideation was significantly correlated with gender ($\chi^2=21.24, P=0.000$), educational level ($\chi^2=18.53, P=0.001$), Occupational status ($\chi^2=25.27, P=0.001$) & Family income ($\chi^2=12.98, P=0.011$).

Conclusion: Suicidal ideation is similar across adult age groups (but lower in adolescents and elderly), marital status and employment whereas it is higher in women, less educated, lower occupational level and lower SES.

AUTHORS
1. Ayça Gürkan¹, Dr., PhD, ayca.gurkan@gmail.com
2. Serap Yıldırım¹, Mrs.
3. Tuba Kutlu³, Mrs.

Objective: The aim of this study was to identify the socio-demographic characteristics of adolescents who attempted suicide and determine the contributing factors to suicide attempts.

Method: The descriptive study was conducted between October 2006 -January 2007 using a sample consisting of 122 outpatients who were being treated at Izmir Education and Research Hospital, Emergency Service, Polyclinic for Children, 61 of whom had attempted suicide and 61 had not. The data was collected using descriptive information sheet (1,2).

Findings: It was seen that adolescents who attempted suicide were relatively less successful at school and belonged to lower income families and had worse relations with friends which is statistically significant (p<0.05). Furthermore, it was determined that parents of these adolescents in question had lower education levels and had been experiencing frequent breakups in addition to the presence of psychiatric diseases, use of alcohol, suicide attempts and violence in their families (p<0.01).

Conclusion: It was concluded that factors such as success at school, relationship with friends and family, education level of parents, problems in the family structure as well as psychiatric disorders, use of alcohol, suicide attempts or violence in the family were characteristics closely related with the suicide attempts of adolescents.

OC-07-06
ANTIDEPRESSANT PRESCRIPTION AND SUICIDE RATES IN BÁCS-KISKUN COUNTY (1999-2006)

INSTITUTIONS
1. Kalm-R BT, Kecskemét, Hungary

AUTHORS
1. Sándor Kalmár¹, Dr, MD, kalm-r@t-online.hu

Objectives: The author determined the effect of antidepressant prescription on suicide rate in Bács-Kiskun County. Despite the number of suicides is significantly decreasing in Bács-Kiskun County since 1984 it is still at a very high level. There are several new hypotheses to explain the decrease, among which, the most controversial is the one looking for connections between the decreasing number of suicide victims and the increasing consumption of antidepressants (N06A).

Methods: The connections between suicides and the consumption of antidepressants were analyzed in the population in 1999-2006, in Bács-Kiskun County. Four indicators were used in the analysis of antidepressant consumption and suicides: 1. The number of patients. 2. DOT. 3. The amount of the antidepressant. 4. DHD. The connections were identified with correlation coefficients.

Results: The results of the analysis supported the hypothesis that despite some contradictions there is a connection between the increase in the antidepressant use and the decrease in the number of suicides.

Conclusions: The complex diagnostics and treatment of depression will lead to the decrease of the risk of suicide of depressed patients.

Keywords: suicide, antidepressants, suicide prevention.
OC-07-07
SUICIDE AS A CHALLENGE FOR PUBLIC MENTAL HEALTH

INSTITUTIONS
1. Serbsky National Research Centre for Social and Forensic Psychiatry, Social psychiatry, Moscow, Russian Federation

AUTHORS
1. Boris S. Polozhy¹, Professor, MD, PhD, bsp@comtv.ru

Objective: persons committed completed suicides.

Results: Despite of recent advances in psychiatry and improvement of social conditions of life in developed countries, the suicide rate still has remained high exceeding significantly the WHO critical level. Particularly it is true for Russia where the rate for completed suicides in 2007 was 30 cases for 100,000 populations. Hence this is a major challenge for public health and well-being. Specificity of suicidal situation in Russia is that suicidal rate in its regions varies from 1 to 120 cases per 100,000. The correlation between suicidal activity of population and its ethno-cultural compound has been found. Taking in consideration this factors the differential programs for suicide prevention were elaborated. That has allowed to lower suicidal rate in average in 1.5 times for 5 years. That indicates the possible beneficial effects of the ethnocultural approach and taking into consideration of social and economical conditions in suicide prevention strategies.

Conclusion: at present the integrative programs for suicide prevention taking into account ethnocultural peculiarities of the population as well as social and economical conditions of the regions of their inhabitance.

OC-07-08
A DESCRIPTIVE ANALYSIS OF 1000 ATTEMPTED SUICIDES

INSTITUTIONS
1. Government Medical College, Department of Psychiatry, Kottayam, India

AUTHORS
1. Sathesh Vadasseril¹, Dr., MD, drvsathesh@sify.com

Introduction: Suicide and Attempted Suicides are important public health problems. Annual global suicide rate is 14.3 per 100,000 population. Attempted suicide is 8 to 20 times more frequent than of completed suicides. Kerala State is unique with 100 % literacy rate. But the suicide rate is 27.3/1Lakh which is about 3 times the national suicide rate-10.6/1lakh. There is much difference among various states of India and various countries in terms of different variables of attempted suicide. Hence this study was conducted.

Objectives: To study the clinical, psycho-socio-demographic and other variables of 1000 attempted suicides.

Method: One thousand suicide attempters referred to the Suicide Prevention Clinic of Government Medical College Hospital Kottayam were evaluated with a proper History, Physical Examination, Mental State Examination and Psychological Assessment. A specially-designed Proforma was completed to collect socio-demographic and other details in the case of each subject. ICD-10 Criteria were used for diagnosis.

Results: were analysed statistically. Findings were discussed.

Conclusions: Association between suicidal attempts and variables like age, socio-economic class, education, occupation, marital status, alcohol consumption, psychiatric diagnosis, gender, past history of psychiatric relevance, place & time of attempt, method of attempt and triggers is noted.

References:
Objective: To describe a prospective follow-up study of all suicide attempts (N: 106) handled during a one-year period (2006-2007) by a public hospital in Rio de Janeiro. We describe the characteristics and identify the main differences between men and women of this sample.

Method: We utilized assertive outreach methods to recruit participants from our target population. Raters were blind to the aims of this study. Participants were assessed in face-to-face interviews on their demographic and clinical histories.

Results: We recruited 90.6% of our sample. The majority were female (62.5%), young adults (55.4%) with a low education (66.7%). Over a third (38.6%) was unemployed and 44.8% was single. Half (51%) had a history of prior suicide attempt; 44.8% reported prior psychiatric/psychological treatment and 40.6% had a current history of psychotropic medication use. Women used medication (46.7%) and men used pesticides (38.9%) as the preferred suicide method. There were statistically significant differences between men and women in unemployment, 47.1% and 17.5%, respectively ($X^2 = 8.79; p = 0.01$); histories of family mental disorders, 36.1% and 18.3%, respectively ($X^2 = 10.602; p = 0.007$); and only use of alcohol during the suicide attempt, 36.1% and 13.3% respectively ($X^2 = 6.831; p = 0.01$). Women were significantly more likely to attempt suicide at home than men, 65% and 35%, respectively ($X^2 = 4.6, p = 0.03$).

Conclusion: Our study suggests that suicide prevention needs to be comprehensive, focusing on young people and those individuals with prior suicide attempts and address the distinctive characteristics of women and men at risk for suicide.

ART & PSYCHIATRY—HOW FAR WE HAVE EXPLORED THEIR RELATIONSHIP & UTILITY.

INSTITUTIONS
1. Calcutta Pavlov Hospital, psychiatry, Kolkata, India

AUTHORS
1. Asis Krishna Acharya¹, Dr., D.I.H(Cal), D.P.M(Ca), dr_asisacharya@yahoo.com

Objectives: Art & medicine are interrelated. Psychiatry is almost intertwined with art & literature creative avenues in bilateral way. A fine artistic, creative way works in the handling & tackling of mentally ill patient or person in emotional crisis. Art in schizophrenia is overtly abstract in nature & sometime too bizarre. In Bipolar artists it may vary. Vincent Van Gogh (1853-1890), used extraordinary brilliant colours in his landscape & other famous painting, that looks as if he is in a hypomanic creative phase. Gogh in his later years suffers from a number of spells of mental disorder, insomonic and later end his life by shooting himself „for the good of all” at 37 years of age. Marilyn Monroe, the famous cine artist of Hollywood on top of her carrier died of barbiturate overdosing, an act of suicide. Art and painting in depressive phase may lose bright colours, show faded shades. Recent Kaplan and Sadocks „Comprehensive text book of psychiatry cover” is designed by a Norwegian artist Munch „Melancholy”. A lady with a hunch back shoulder looking downwards in front of a beautiful landscape which in others may bring joy on gazing to the nature.

Methods: Here art utilisation is explored. Rosarach's ink-blot test or TMT test are utilised for unfolding the unconscious. B.G test is used when organicity involvement is assessed.

Results: Art are interrelated, where by studying a portrait or a landscape may reveal enormous angles if we can judge them. Conclusions: It’s encouraging to get utility topics like „Art & Psychiatry” which may be vast field yet less traversed.

NEURODEGENERATIVE DISORDERS IN PEOPLE WITH DEVELOPMENTAL DISABILITIES

INSTITUTIONS
1. University of North Carolina School of Medicine, Psychiatry, Chapel Hill, United States

AUTHORS
1. Larry Jarrett Barnhill Jr¹, Dr., MD, Jarrett_Barnhill@med.unc.edu

AIMS/OBJECTIVES: This paper addresses the problems inherent in the differential diagnosis of neurodegenerative disorders in individuals with developmental disabilities. The process of differential diagnosis is complicated by pre-existing mental disorder, adaptive deficits, neurological disorders such as epilepsy, and the tendency to misattributing neuropsychiatric symptoms for those associated with primary mental disorders.

METHODS: Case materials regarding Huntington's disease, Multiple sclerosis, neuroacanthocytosis, and several mitochondrial disorders will be reviewed. The emphasis is on a description of the psychiatric symptomatology and problems associated with differentiating these symptoms from those associated with other psychiatric disorders in individuals with developmental disability.

RESULTS: Most neurodegenerative disorders are associated with atypical forms mood/anxiety disorders, impulsive/repetitive behaviors and a range of psychotic symptoms. The differential diagnosis requires clinicians to incorporate cognitive changes and evolving neurological symptoms into the assessment. Among individuals with moderate to severe developmental disability, the recognition of these conditions requires a high index of suspicion, and sensitivity to atypical features of primary psychiatric disorders.

Conclusion: Even among individuals with severe developmental disorders clinicians can differentiate degenerative disorders based on further loss of adaptive skills, cognitive changes, gait and coordination changes, emergence of new seizures, abnormal movements and sensorimotor changes. Once diagnosed appropriate palliative treatments can be initiated and the risk/benefits of psychotropic medications reassessed.

The results of two telepsychiatry pilot projects and seven years of telepsychiatry as a routine service at the Canary Islands Health Service will be presented. After 265 patients, 1260 teleconsultations and more than 1300 hours of clinical practice, we have available information about acceptance, satisfaction and clinical efficacy of this welfare activity that will be presented.

Telepsychiatry in the 21st century poses a wide range of ethical challenges. In this presentation, issues related to privacy, security, confidentiality, informed consent, and professional liability in the use of telepsychiatry services will be revised remarking the need to create formal professional ethical guidelines for the practice of telepsychiatry.

LESSONS LEARNED AFTER TEN YEARS OF TELEPSYCHIATRY PRACTICE

INSTITUTIONS
1. University of La Laguna, Psychiatry, San Cristobal de la Laguna, Spain

AUTHORS
1. Carlos de las Cuevas1, Prof., MD PhD, cdelascuevas@gmail.com

As Arthur Schopenhauer said (1788-1860) “There are three steps in the revelation of any truth: first, it is ridiculed; in the second, resisted; in the third, it is considered self-evident”. Considering telepsychiatry, and according to our experience, we have no doubts about that telepsychiatry is an adequate vehicle for mental health care that increases access to care and user satisfaction constituting an effective means of delivering mental health services to psychiatric outpatients living in remote areas with limited resources with a clinical efficacy indistinguishable of the corresponding one to face-to-face psychiatric treatment. Nevertheless, we had to face significant technical and interpersonal barriers and deeply embedded professional constructs about the nature and practice of therapeutic relationships were challenged. The lessons learned along our telepsychiatry experience will be presented with the aim that could be useful for future telepsychiatric developments.

DEVELOPING AND IMPLEMENTING AN E HEALTH MENTAL HEALTH RECORD IN NHS AYRSHIRE AND ARRAN

INSTITUTIONS
1. NHS Ayrshire and Arran, E-Health, Irvine, United Kingdom

AUTHORS
1. Mark Fleming1, Mr, mark.fleming@aapct.scot.nhs.uk

NHS Ayrshire and Arran have over the past 5 years developed and implemented a clinical information system across their mental health service. The system supports the systematic collection of demographic, assessment, care planning and patient contact activity within an e-health framework that allows for secure easy access to patient information from PC terminals within the organisation. A development, support and training team has worked with clinical staff to analyse the care processes and create an information system that reflects both the care process and the professional record keeping standards. New developments recently have included the access to child protection information stored by social work, an interface to display test results and associated information stored within shared systems. Staff have the ability to use the system in a mobile fashion from patients homes allowing for the smooth flow of information between community and hospital services. National developments have led to the development of integrated care pathways for mental health conditions. The system allows for the collection of variances from pathways in order that the reporting systems can analyse aggregated information and support the development of action plans to help improve service provision. There has been a large focus on training staff to improve their IT skills and then apply those skills within the electronic record. The presentation will focus on the development and implementation challenges, explore the benefits of the system to staff and patients. A series of screenshots will demonstrate the application of the clinical processes in the e-health framework.
ART MAKING AS A STRATEGY TO IMPROVE THE HEALTH OF INDIVIDUALS WITH PSYCHIATRIC CONDITIONS

INSTITUTIONS
1. Eastern Michigan University, School of Health Sciences, Ypsilanti, MI, United States
2. St. Joseph Mercy Hospital, Department of Psychiatry, Ann Arbor, MI, United States

AUTHORS
1. Valerie Howells¹, Dr, PhD, vhowells@emich.edu
2. Thomas Zelnik², Dr, MD, zelnikt@trinity-health.org

This paper will present findings of a study that explored the impact of participation in a community arts studio on persons with and without psychiatric conditions, including the effect of art-making on social isolation, stigma, and discrimination. Ethnographic methods used during this year-long participatory research study included semi-structured in-depth interviews of twenty student artists prior to and following studio participation, field observation within the studio, document review, and member checks. All interviews were audiotaped and transcribed. Each transcript was independently coded by members of the research team, and a code book was developed by consensus. A key finding of the study was that art making acted as a scaffold for personal change and the development of a community of artists. Student artists described changes in their perceptions of themselves, in their roles and routines. Further, art making provided a bridge between the studio and the greater community, offering participants opportunities for access and greater inclusion. Student artists with psychiatric conditions described art making and the studio experience as therapeutic, but strongly differentiated it from traditional therapy. Clearly demonstrated in this study was the value of engaging in shared interests with others, specifically making art. As clinicians and policy makers continue to struggle with well-intended but inadequate efforts and programs to improve the health and quality of life of persons with mental illness, it is programs such as the one in this study that offer practical local strategies to enhance social inclusion and recovery.

POSTTRAUMATIC STRESS REGRESSIVE SYNDROME (PSRS) IN RUSSIAN JUVENILE PRISONERS

INSTITUTIONS
1. Bashkir State Medical University, Russian Federation

AUTHORS
1. Radik Masagutov¹

Background: Russian juvenile prisoners can be characterized as a „caste-structured” population; that is, they are informally stratified along a peer social hierarchy which is tolerated within the system. A notable minority of juvenile prisoners are chronic victims of physical violence, sexual assault, torture, and threats of violence. Case Study: This paper reports 85 juvenile cases of all 623 imprisoned Russian male adolescents from 14 to 18 years old (13.6%), who were under psychiatric examination in 1998-2000 in two Russian juvenile jails. These jails were located in Sterlitamak city, the Republic of Bashkortostan. These 85 juveniles were victims of physical and/or sexual violence, or torture. They expressed a similar constellation of psychiatric symptoms suggestive of PSRS: (1) psychic and behavioral regression symptoms (loss of neatness, loss of normal human speech, loss of fastidiousness, and eating food waste); (2) bulimia; (3) some PTSD symptoms, and (4) depression. Genesis of this psychiatric constellation is discussed as an example of dissociative thinking. Etiologic factors, predisposing factors, and factors that influence the clinical picture of this disorder are discussed. Conclusion: The authors describe a regression syndrome that should be considered as an additional form of traumatic stress mental disorder, specified in an adolescent prison population. Its clinical description seems suitable to a heading ICD-10 „Reaction to severe stress, and adjustment disorders” (F43).

DO PSYCHIARTISTS THEMSELVES ARE AWARE OF SUICIDALITY AMONG PSYCHIATRISTS

INTRODUCTION: In suicidal risk factors assessment, “current evidence supports, that both male and female physicians have elevated rates of suicide. Among physicians, psychiatrists are considered to be at greater risk, followed by ophthalmologists and anesthetists, but all specialties are vulnerable.” Incidence of suicide is highest among psychiatrists specialty, and lowest in pediatrician specialty indicating exposure to mentally unhealthy population may cause harm.

METHODS: Analysis of a suicidal death report of a psychiatrist, Calcutta Pavlov Hospital, a 250 bedded largest governmental mental hospital, is the issue here. The death, by hanging in a semi-need-down state, is copied from a recent suicide in the hospital by an old man >60 years: took place on 14th of Feb08, in the Doctors duty room, on 53rd years of age. He is married, with 1 daughter and 2 sons. A month back, after the old man’s death, death report papers were made by this psychiatrist, who felt guilt punishment. His wife consulted one medical college psychiatry dept. Psychiatrists of the Pavlov hospital review his depressive illness.

RESULTS: It was learnt from her wife, he refused all treatment. He did not leave any suicidal note, & actually suffered from some aloofness, as he failed to keep relation with any relative of him or in-laws. He worked recently in withal-state and non-communicative way. No family members ever contacted and no follow-up. Alarm of a suicide was never raised.

CONCLUSION: Adoption of suitable treatment method, psychotherapy, and failure to send signal to family members on possibility of suicide shows our lack of awareness of dealing fellow psychiatrists’ disorder properly.

5. Andrea R. Fleiszer3, Ms., BSc BN RN, andrea.fleiszer@mail.mcgill.ca

Aims: The goal of this presentation is to examine and describe liaison interventions as performed by Consultation Liaison (CL) professionals in a major Canadian University Hospital setting. The liaison activities of the psychiatric consultant, working in the traditional “liaison model” (ZL Lipowsky 1967), and the liaison interventions of interdisciplinary CL psychiatry teams, are central to collaborative interprofessional evaluations and interventions.

Methods: Case vignettes to illustrate the liaison components of CL activities will be presented by CL psychiatrists and clinical nurse specialists representing professional practice with hospitalized pediatric, adult, and geriatric patients and their families. Various perspectives on “liaison”, both in the context of the traditional model and as practiced by a CL interdisciplinary team will be elaborated. An interactive presentation will offer a forum for exchange and exploration of internationally diverse liaison experiences.

Results: The term liaison describes a potentially broad range of activities and roles. The presenters from a Canadian University Hospital setting propose an inventory of these activities and roles based on interprofessional academic and clinical information. These are implemented in the context of both the traditional “liaison model” as well as in the interdisciplinary CL team approach.

Conclusion: The current practice of “liaison” by the CL service is influenced by multiple factors such as its historical origins, today’s fast-paced fragmented healthcare services, as well as cultural context. The liaison functions of the nurse and psychiatrist are complementary and fundamental. The liaison role ultimately serves to advocate for competent, comprehensive, and compassionate healthcare for patients and their families.

SITUATION ANALYSIS OF MENTAL HEALTH IN AZERBAIJAN

INSTITUTIONS
1. Azerbaijan Medical University, Psychiatry, Baku, Azerbaijan
2. Public Health and Reforms Center, Baku, Azerbaijan
3. Psychoneurological Dispensary, Baku, Azerbaijan

AUTHORS
1. Fuad Ismayilov1, MD, PhD
2. Shirin Kazimov2, MD
3. Murad Sultanov3, MD
4. Sabukhi Abdullayev4

Objective: The purpose of the research was to evaluate the situation in mental health in our country.

Methods: The research is based on World Health Organization Assessment Instrument for Mental Health Systems (WHO-AIMS) which is a new tool for collecting essential information on the mental health system of a country or region.

Results: In the first section of the research the social and demographic characteristics as well as economical indicators, information on policy and legislation are considered. The second section describes existing mental health services. The next sections are related to primary health care, human resources, public awareness and monitoring and researches in mental health.

Conclusions: The data collected determine the challenges and put the tasks to be performed in the process of further mental health reform.

JOB SATISFACTION OF EMPLOYEES IN FACTORIES

INSTITUTIONS
1. Prince of Songkla University, Education Foundation, Songkhla, Thailand

AUTHORS
1. Kanda Janyam¹, Dr., PhD, jkandaj@hotmail.com

The purpose of this study was to investigate the level of job satisfaction of employees in factories in the province of Songkhla in the south of Thailand, to identify factors related to job satisfaction, to construct predictive model, to identify problems/obstacles in promoting job satisfaction and to suggest solutions. 1,009 questionnaires were used for analysis. Correlation and regression analysis were used for testing the hypothesis. Results revealed that job satisfaction of the employees was moderate. Position, pay, work security, autonomy, supervisor support, co-worker support and promotional opportunities were positively related to job satisfaction while role ambiguity and extra-role conflict were negatively related to job satisfaction. Moreover, between these variables, there were eight variables that significantly predict job satisfaction. Age, pay, work security, autonomy, supervisor support, co-worker support, and promotional opportunities positively predict job satisfaction while extra-role conflict negatively predicts job satisfaction. These results indicate that the variables related to work have a direct effect on job satisfaction. Therefore, to improve job satisfaction, the results suggested a number of solutions that the organization should pay more attention to.

CRISIS OF PSYCHIATRY IN GENERAL HOSPITAL IN JAPAN

INSTITUTIONS
1. Narita Red Cross Hospital, Psychiatry, Narita, Japan

AUTHORS
1. Shigeki Sato¹, Dr., MD, shige@beige.ocn.ne.jp

It's famous that the number of psychiatric beds in Japan is largest in the whole countries. In many of European and North American countries deinstitutionalization has accomplished and now mental health system is under community based psychiatry. But in Japan yet hospital based psychiatry is continuing. I think the reason is as follows, first, most of mental hospital is private foundation, second, there are little public sentiment in Japan that psychiatric patients should lived in their community, third, this is the crucial reason, we are lacking of pertinent mental health policy. In such Japanese psychiatric situation, psychiatric beds of general hospitals are closing and reducing. It caused by maldistribution of medical doctors following new clinical training system for post graduate doctors and by extremely low medical reimbursement for patients hospitalized in psychiatric units of general hospitals compared with other medical or surgical units. Moreover psychiatrists working at general hospitals are very busy in treatment for inpatients, implementation of liaison-consultation and coping with numerous outpatients. We often hear the news that beds for patients who needs hospitalization are lacking by closing of psychiatric beds of local general hospital under no community support. We would like to report the crisis of psychiatry in general hospital in Japan and stress that new mental health policy must be established in Japan for shift to community based psychiatry from hospital based psychiatry and in that new policy the importance of psychiatry in general hospital should be esteemed.
THE IMPORTANCE OF THE ETHICS OF THE PROFESSIONAL OF THE MEDICINE IN HIS OWN MENTAL HEALTH AND IN THAT OF HIS PATIENT

INSTITUTIONS
1. Ámbito privado, La Coruña, Spain

AUTHORS
1. Ana M Vázquez1, Dr., MD, PhD, avr@iet.es

The aim of this communication is to stress the great importance of the ethics of the psychiatrist during his professional exercise, as well as the current threat and difficulty for the exercise of it. According to the Codes of Deontology of the medicine, the doctor owes his first loyalty to the patient and the health of this one has to be in front of any other convenience.

Nevertheless, we see that, in a world with strong created interests, there do not exist the institutional and social structures that favor such a basic exigency.

As López Ibor (1999) says, is not habitual that, in the traditional medicine, attend to the psychological factors. A major effort is necessary to preserve this basic ingredient in any doctor-patient relationship and, therefore, in any relation that tries to be therapeutic.

Review of the topic is done and there exists abundant literature that stresses the importance of looking, first of all, for the good of the patient, as indispensable element for the treatment and for an ideal doctor-patient relationship (Peabody 1927, Gorlin and Zucker, 1983, Othmer, 1996 and Lain Entralgo 1984).

The study concludes the importance of something, so threatened, as the importance of choosing, in the medical action, first, to do the major good to the patient, preferring this to the particular interests.

BRUISES OF THE BATTERED BODY SOMATISATION AND PSYCHOSOMATIC DISORDER: ETIOLOGY AND TREATMENT IMPLICATIONS

INSTITUTIONS
1. Amazonic Alpha, Integrative psychiatry, Birmingham, United Kingdom

AUTHORS
1. Ruth L Brand Flu, Dr, MD, amazonicalpha@aol.com

Aims: This paper will briefly outline explanations of psychosomatic illness, individual and integrative team/multidisciplinary approaches will be reviewed. Conversational technique and narrative will be illustrated, including polarised responses and other pitfalls.

Method: Depending on size of audience interactive approach. Theories on aetiology followed by clashing interpretations by professional and patient. Treatment and management suggestions. All interspersed with vignettes. Handouts are available. Psychosomatic illness and somatisation are issue of concern in all braches of medicine, with considerable burden on individual, professional group and society. Chronicity carries cost implications. Somatisation has also been described as a form of a defence mechanism, an unconscious process, which might explain the lack of "insight" into the problem. A wide rage of treatment options have been described such as biological approaches, CBT, psychodynamic psychotherapy and even alternative treatments have been implicated. Research findings of prospective objectified physical illness side tracks psychological treatment by over-emphasis on physical investigations. Biological approaches and symptomatic treatment commonly have incomplete effect. Lack of trust in professionals precludes engagement. Collusive reactions can be induced in the professional such as over-medicalisation due to fear of litigation or conflict. Medical negligence can occur when symptoms are missed. Intellectualised discussions, profuse use of jargon or polarised dichotomised views between professional and patient can stagnate treatment. Patient's perspective needs to be explored for narrative details. Medical information is prone to misinterpretation. One also has to be mindful of nonverbal communication and suppressed feelings.

PEOPLE’S AWARENESS ABOUT EPILEPSY AND THEIR CHOICE OF MODE OF TREATMENT - A FOLLOW UP SURVEY AFTER 5 YEARS IN RURAL INDIA

INSTITUTIONS
1. Global Mental Health Institute, Social Psychiatry, India

AUTHORS
1. Hiranmay Saha, Mr., MD, dr_hsaha@yahoo.co.in

Aims: Epilepsy is a serious medical problem throughout the world. Stigma and taboos of epilepsy is universal. Lack of knowledge and misconception on epilepsy makes things worse. 85% of world’s epileptic patients are not getting proper medicines. But medical treatment of epilepsy is possible in any remote corner of the world. 6-7 millions of epileptic patients belong to India which counts for one-eighth of world’s epileptic population. Our aim is to observe the improvement in people’s ability to detect epilepsy, extent of their stigma and prejudice and their choice of mode of treatment in this follow up study after 5 years with same questionnaire.

Method: A survey was conducted in rural areas of West Bengal, India on school teachers, house wives, primary health care assistants and old people of 60-65 years of age. Area of survey was almost same and number of sample was also same as before.

Results: 80-85% of all groups consider that epilepsy is serious medical problem in comparison to 65-70%, 5 years back. There is also a dramatic improvement regarding stigma and prejudice about epilepsy in all the groups. 80-87% of all the groups agreed that anti-epileptic drugs to be continued for long but in earlier study of 5 years back it was 45-47%.

Conclusion: There is a tremendous improvement in the attitude and scientific knowledge of the village people of our area of survey regarding epilepsy. An extensive awareness campaign on epilepsy in villages can do immense good for the community.

LEVEL OF ANXIETY IN WOMEN SUFFERING FROM BREAST CANCER

INSTITUTIONS
1. Mental Health Research Institute, Preventive Psychiatry Department, Tomsk, Russian Federation

AUTHORS
1. Olga A. Bekher1, Mrs., niipz@sibmail.com

Anxiety in cancer patients may be associated with symptoms of the illness and treatment. We have examined 102 women with diagnosed breast cancer. In addition to traditional clinical-dynamic observation, clinical “Hamilton Anxiety Scale” was used. Use of this questionnaire has shown that only in 14.71% of female patients did not achieve the clinical level (i.e. total score according to questionnaire has constituted less than 8), in 36.27% - mild level of anxiety has been revealed (8 - 16 scores), in 33.33% - moderate (17 - 24 scores) and in 15.69% - level of anxiety was not more than 24 scores. However, there were female patients with total score 0 (according to Hamilton Anxiety Scale), what we explained as manifestation of psychopathological reactions due to tense mental state. But there were also women which level of anxiety exceeded 30 scores what was discussed with treating physician and corrected with administration of anxiolytics. Basic indices determining level of anxiety were: anxious mood, preoccupation, expectation of the worst, irritability (1.80±0.09); tension, inclination for tears, exhaustibility, nervousness, inability to relax (1.71±0.10); sleeplessness, difficulties with falling asleep, absence of feeling of rest from the sleep (1.41±0.09); neurovegetative symptoms, dry mouth, inclination for sweating, headaches, tension in body (1.35±0.09). Level of mental anxiety and tension was statistically reliably higher of some somatic symptoms and fear (p<0.05). Thus, in female patients suffering from breast cancer, sufficiently high level of personal anxiety is recognized that predominantly has mental and neurovegetative character and requiring the qualified correction by a psychiatrist.

AFOBAZOL IN ANXIETY DISORDERS IN PATIENTS WITH ARTERIAL HYPERTENSION

INSTITUTIONS
1. Siberian State Medical University, Russian Federation
2. Mental Health Research Institute, Russian Federation

AUTHORS
1. Nataly Garganeyeva1,2
2. Margarita Belokrylova2
3. Valentin Semke2
4. Elena Epanchintseva2

Afobazol® (Masterpharm, Russia) is a selective anxiolytic not belonging to class of benzodiazepine receptors agonists with activating component and without hypnosedative effect. We have examined 29 patients (age 43.85±7.4 years) with arterial hypertension stage I-II and with neurotic, stress-related disorders. Results of clinical-psychopathological examination were supplemented by indices of Hamilton Anxiety Rating Scale. Complex therapy included antihypertensive remedies as adequate mono- or combined therapy.

Results: In comorbid combination with AH we observed adjustment disorders in kind of mixed anxious and depressive reaction (14 cases) or with predominance of disturbance of other emotions (5), generalized anxiety disorder (4), neurasthenia (5), and PTSD (1). Efficacy of therapy with afobazol was assessed during 4-week course of intake of 30 mg a day with account for basic indices: asthenia, anxiety, and hypochondria. Reduction of vegetative and asthenic symptoms was noticed earlier than in controls. Reduction of asthenic symptoms and recovery of productivity was accompanied by significant decrease of anxiety to days 5-7. To the end of the second week severe manifestations of anxiety in patients with HI stage I disappeared. Predominance of cognitive component in anxious experiences in patients with HI stage II somewhat decreased the expected effect. Total score according to Hamilton Anxiety Scale in group of patients with afobazol decreased from 18.3±1.6 to 9.0±0.2 (p<0.01).

Conclusions: New preparation of anxiolytic action broadens possibilities of differentiated complex therapy of patients with neurotic disorders and allows considering this preparation as an effective remedy for removal of psychopathological symptoms in patients with AH.

PSYCHOSOCIAL FACTORS OF FORMATION OF MENTAL DISORDERS IN PATIENTS WITH METABOLIC SYNDROME

INSTITUTIONS
1. Siberian State Medical University, Russian Federation
2. Mental Health Research Institute, Russian Federation

AUTHORS
1. Nataly Garganeyeva*
2. A. I. Rozin*
3. E. V. Ryabova
4. V. N. Masynova
5. S. Yu. Shhtarik
6. D. S. Kaskayeva

Objective: To study interrelationship of somatic and psychosocial factors in patients with metabolic syndrome in patients with mental disorders of neurotic and affective level.

Material and methods: Investigation included 82 patients (mean age 52.7±7.4 years) with neurotic, stress-related, affective, organic mental disorders. In 92% of cases we revealed arterial hypertension, in 80% excessive body mass and obesity, in 24% diabetes mellitus type 2 or disturbance of tolerance to glucose, in 58% atherogenic dyslipidemia.

Results: Method of logistic regression has identified statistically significant interrelationships of somatic, mental and psychosocial factors. Prognostic signs of somatic and mental disorders (Concordant = 92.7%; Somers’ D = 0.881) were level of glycemia (p=0.0001); duration of mental disorder (p=0.0002); body mass index (p=0.0001); dyslipidemia (p=0.0001) and hypoalphacholesterolemia (p=0.0001); stress factors (p=0.0001); volume of chest and volume of waist (p=0.0001), vegetative disorders (p=0.0005); age of onset of mental disorder (p=0.0118); Aniclinic, anxious, anxiety-phobic, depressive disorders (p=0.0029); family history (p=0.0337); subjective attitude of patient towards his/her disease (p=0.0046). Patients were characterized by presence of fear of death, low self-esteem of his/her own abilities, decrease of activity, dissatisfaction with his/her own state, anosognosia. Psychological state of patients was characterized by anxiousness (p=0.0215), hypochondriac fixation (p=0.0024), disturbances of social adaptation (p=0.0015).

Conclusions: For assessment of prognosis of development of degree or risk of vascular complications along with associated components of metabolic syndrome (AH, DM type 2, metabolic disturbances of carbohydrate and lipid metabolism) one should take into account psychological and psychosocial risk factors in patients with MS.

ANTICONVULSIVE PROPERTIES OF M-CHLORBENZHYDRILUREA: PROSPECT OF APPLICATION

INSTITUTIONS
1. Mental Health Research Institute, Russian Federation

AUTHORS
1. Tatyana Novozheyeva
2. Tamara Shushpanova
3. Valentin Semke

Purpose: To study original halogen derivative of urea. This is a perspective class of pharmacological active substances. As a rule, these compounds are not toxic.

Methods: Compound M-chlorbenzhydrilurea, (Galodif), has been studied in 780 linear and cyclic derivatives of urea. Anticonvulsive properties of derivatives of urea are studied according to 4 experimental models of spasms (maximal electroshock, corasol, strychnine and camphor). In animal experiments, mechanism of anticonvulsive action of Galodif, as compared with classical anticonvulsive preparations - phenobarbital, benzonal, diphenin, and phenuron has been studied.

Results: Galodif possesses high anticonvulsive activity in all models - maximal electroshock (11.8 ± 1.7) mg/kg, corasol (218.0 ± 18.1) mg/kg, strychnine (252.0 ± 32.1) mg/kg and camphor (37.2 ± 4.2) mg/kg spasms, possesses a substantial central M-cholinolytic and weak H-cholinolytic action, blocks convulsive action of tiosemicarbamide. In mechanism of anticonvulsive action of Galodif the important role is played by its normalizing action on hydroelectrolyte balance of brain. Galodif stabilizes concentration gradient of ions, interferes change of membrane permeability and membrane potential of cell. The preparation breaks development of a hypostasis-swelling of brain in epileptic spasms. Clinical study of Galodif was conducted in 528 patients with epilepsy of various geneses. The preparation most effectively stops primarily general tonic and clonic convulsive attacks. It is shown in patients, suffering from focal attacks of type Jackson and temporal epilepsy with psychomotor and psychosensitive components.

Conclusion: Thus, Galodif - possesses a wide spectrum of anticonvulsive activity and is safe for long application including in conditions of pathology of liver.

A randomised clinical trial of mirtazapine, placebo and cognitive-behavioural therapy

Objectives
To examine the effect of a comprehensive cognitive behavioural treatment program (CCbt) compared to placebo-controlled mirtazapine medication in patients with chronic fatigue, and to study the combined effect of the comprehensive treatment program and medication.

Methods
A three-armed randomised clinical trial (RCT) of mirtazapine medication, placebo drug and a comprehensive cognitive treatment program (CCbt) was conducted to investigate treatment effect in a patient group (n=72) with chronic fatigue diagnosed with Neurasthenia (n=72) and chronic fatigue syndrome (n=65/72), referred to a specialist clinic. The CCbt program was compared to mirtazapine and placebo for 12 weeks, followed by a 12 weeks treatment regimen with a mixed crossover-combination design. Assessments were done by 12 and 24 weeks.

Results
By 12 weeks, treatment effect was significantly better in the group initially receiving the comprehensive treatment program (Fatigue scale (p=0.014); Clinical Global impression (p=0.001)). By 24 weeks, the treatment group initially receiving CCbt 12 weeks followed by mirtazapine 12 weeks showed significant improvement, compared to other treatment groups (Fatigue scale (p<0.001) and Clinical Global impression (p=0.002)). Secondary outcome measures showed overall improvement, but no significant differences between treatment groups.

Conclusions
Multimodal interventions may have positive treatment effects in chronic fatigue syndrome. Sequence of interventions seems to be of importance.

TRANSCULTURAL RESPONSE PATTERNS THROUGH THE ADMINISTRATION OF AN INITIAL PROTOCOL DESIGN: PRELIMINARY RESULTS OF A PILOT STUDY

INSTITUTIONS
1. Venosta International Studio of Mental Health, psychiatry, Milan, Italy
2. Cecchini Pace Foundation, school of specialization in transcultural psychotherapy, Milan, Italy

AUTHORS
1. Caterina Ambrosi Zaiontz¹, DR, PhD, info@studiovenosta.com
2. Denise Buren¹, DR, PhD, info@studiovenosta.com
3. Davide Cavagna¹, DR, PhD, info@studiovenosta.com
4. Anna Arduini¹, DR, MD, info@studiovenosta.com

Aim: This paper explores preliminary results of a pilot study carried out by the Venosta International Studio of Mental Health from a sample of 100 patients. The aim of the study is:
- To explore the effects of the protocol on culturally diverse patients' populations: Anglo-American, Northern European and Italian.
- To reduce the patient's level of perceived or real anxiety through an effective protocol aimed at facilitating a collaborative approach during first interview.
- To evaluate the applicability of the protocol independently of psychopathology.

Methods: The research is carried out through a self-administered questionnaire, given to patients upon their first visit, (after having received comprehensive information about the Practice) and a satisfaction questionnaire. The initial questionnaire is divided into four clusters of information: personal information, case history, current symptoms and manifestations rating form.

Preliminary Results: Our first postulate indicates that the majority (66.6%) experienced a high level of satisfaction with the survey protocol. Our second postulate also reveals that the patient's anxiety is not altered throughout the survey administration. The third postulate indicates that patient' responses do not vary with psychopathology, thus, the survey is independently applicable to a wide range of pathological pictures.

Discussion: Current globalization trends reflect the dynamic components of transculturalism in the field of clinical psychology and the need for continued exploration of mental health approaches designed for the multi-cultural patient of the present and the future.

The paper will discuss certain terms, used alternately, such as client-patient, dependency-addiction, and others. The origin and meaning of such terms, both in clinical and philosophical sense, the possible reasons behind their use, and the implications and consequences of their use are discussed. The author wants to point to the importance of precise use of terms. Terms correctly chosen enrich our clinical understanding, determine a pragmatic approach, influence the perception and attitude of all those involved. Political correctness applied superficially may paradoxically result in increasing bias and deflecting the clinical approach. Both medical and philosophical arguments point to this. The subject seems to be of paramount importance in our age of the dehumanization and mechanization of medicine.

In 1992, Australian Health Ministers adopted the Australian National Mental Health Strategy. The first National Mental Health Plan to come out of the strategy called for the deinstitutionalisation of clients with mental illness and the mainstreaming of mental health services into general health care facilities. This resulted in annual increases of 13 to 35 percent of people presenting to emergency departments (ED's) across Australia to access mental health care. In Australia, ED's are staffed by general trained medical and nursing staff who are generally poorly equipped to assess and manage clients with a mental illness. Since 1994 specialised mental health triage scales (MHTS) have been developed with the specific aim of improving the capacity of ED staff to assess and mange clients with mental illness and despite there being one triage scale for clients with physical illness and injury there are now a number of MHTS in use around Australia. Simultaneously, various models of mental health service delivery have been developed and independently implemented. Literature that demonstrates the effectiveness of any model of mental health care at improving the responsiveness of mental health services to ED's is scarce. There are lessons to be learnt from the current ad hoc approach to emergency mental health care in Australia by clinicians and policy makers planning changes to the provision of mental health care in the community and those in emergency departments faced with the initial assessment and management of clients with a mental illness.

INTRODUCTION: The association between psychosis and criminal behaviour is complex and has not yet been completely understood. The identification of clinical predictors of violence may be an important contribution to the prevention of this type of behaviour in psychotic patients and the protection of society as well in unravelling of its biological underpinnings. Our aim is to study socio-demographic and clinical variables associated with violent behaviour in psychosis.

METHODS: 86 psychotic patients were assessed using the Portuguese version of the Diagnostic Interview for Genetic Studies (Azevedo et al., 1993). The final diagnoses were obtained through a best-estimate lifetime procedure using the OPCRIT (Azevedo et al., 1998). Patients with a history of violent behaviour (n=43) were compared with a group without violent behaviour (n=43).

RESULTS: OPCRIT items associated with criminal conduct were the following: family history of schizophrenia (p=.039), restricted affect (p=.001), well organized delusions (p=.004), delusions of influence (p=.006), bizarre delusions (p=.028), widespread delusions (p=.012), delusions of passivity (p=.020), other primary delusions (p=.017), thought broadcast (p=.003), third person auditory hallucinations (p=.022), running commentary voices (p=.003), abusive/accusatory/persecutory voices (p=.029), other (non-affective) auditory hallucinations (p=.003), and non-affective hallucination in any modality (p=.002).

CONCLUSIONS: Unlike other studies, we didn’t find an association between social-demographic variables and a previous history of violence in this group of psychotic patients. Our results are in line with the recommendation of a recent study (Swanson, 2006) which underlines that we should primarily value clinical aspects in the evaluation and management of violence in patients with schizophrenia.
